Status of solar energy research and development in Australia
[NP-1903916] p0073 N82-12611

Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1
[DE82-000808] p0019 N82-12613

Performance analysis of 11 Denver Metro passive homes
[DE81-025473] p0074 N82-12626

Modelling energy-economic interactions in developing countries: A linear-programming approach
[DE81-026048] p0020 N82-12637

Technology characterizations: Environmental information handbook, second edition
[DE81-029993] p0021 N82-12671

Alternate hybrid power sources for remote site applications
[AD-A099471] p0024 N82-13512

Information resources in the USA on new and renewable energy, a description and directory
[DE81-028867] p0024 N82-13522

Microemulsions, emulsions and related systems: Energy applications
p0113 N82-13545

Health and safety research division
[DE81-026088] p0026 N82-13652

LLNL 1981: Technical horizons
[DE81-028265] p0026 N82-14048

Pulsed Power Research colloquium
[AD-A105770] p0150 N82-14638
Need for power and the choice of technologies: State decisions on electric power facilities
[DE81-025960] p0027 N82-14644
Fire-protection research for energy technology: Fy 80 year end report
[DE82-000970] p0161 N82-14649
Analysis of the energy impacts of the DOE Appropriate Energy Technology Small Grants Program: Method and results
[DE81-029844] p0028 N82-14651
Flywheel rotor and containment technology development
[DE81-028047] p0159 N82-14655
Energy recovery from municipal waste development program for Idaho Falls, Idaho
[DE81-029999] p0028 N82-14659
Seminars for private college administrators on solar applications for college buildings
[DE81-027981] p0079 N82-14661
Value tree analysis of energy supply alternatives
[AD-A105629] p0029 N82-14875
Millions wasted trying to develop major energy information system
[AFMD-81-40] p0029 N82-14959
An assessment of nonfossil hydrogen
[PB81-246522] p0087 N82-15231
Hydrogen as carrier of secondary energy: Proposal for a research and development program
[DFVLR-MITT-81-10] p0087 N82-15542
Role of large scale energy systems models in R&D planning
[DE81-026058] p0031 N82-15543
Solar energy training program for code enforcement personnel
[DE81-030053] p0081 N82-15563
Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052] p0081 N82-15572
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029883] p0082 N82-15578
Indian energy abstracts
[PB81-232316] p0032 N82-15591
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries
[PB81-231011] p0032 N82-15592
Methodology and basic algorithms of the Livermore Economic Modeling System
[DE81-029430] p0035 N82-15833
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] p0035 N82-16014

ENERGY TRANSFER
An experimental study of SO3 dissociation as a mechanism for converting and transporting solar energy
p0043 A82-11214
Energy transfer in wind-assist electric power systems
p0130 A82-14359
Review of simulation techniques for Aquifer Thermal Energy Storage (ATES)
[DE81-029943] p0156 N82-10532
Environmental impacts of energy transportation
[DE82-900316] p0025 N82-13559

ENGINE CONTROL
A study of factors influencing thermally induced backfiring in hydrogen fueled engines, and methods for backfire control
p0084 A82-11791
The role of avionics in the all electric airplane
[AIAA 81-2219] p0002 A82-13457

ENGINE DESIGN
Liquid hydrogen for automotive vehicles - Experimental results
[ASME PAPER 81-HT-83] p0083 A82-10968
The AGT101 technology - An automotive alternative
p0123 A82-11783
Development of a solar receiver for an organic Rankine cycle engine
p0048 A82-11800
Overview of DOE's large stationary Stirling engine development program
p0123 A82-11805
Conceptual design of a large coal-fired stationary Stirling engine
p0123 A82-11806
Conceptual design of 500 to 3000 hp Stirling engines for stationary power generation
p0123 A82-11807
Development free-piston Stirling test-bed engine
p0123 A82-11808
Regenerative pyroelectric heat engine
p0126 A82-11833
On the efficiency of thermal engines with power output - Harmonically driven engines
p0131 A82-14489
Ceramics for the AGT101 automotive gas turbine
p0132 A82-16827
A computer model of a stirling engine using a two-phase two-component working fluid
p0137 N82-10492
Test results and facility description for a 40-kilowatt stirling engine
[NASA-TM-82620] p0141 N82-13013
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 1: Summary
[PB81-219479] p0022 N82-13018
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 2: Appendices A through C
[PB81-219487] p0022 N82-13019
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 3: Appendix D
[PB81-219495] p0022 N82-13020

ENGINE PARTS
Conceptual design of 500 to 3000 hp Stirling engines for stationary power generation
p0123 A82-11807
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 2: Hot component corrosion evaluation
[DE81-903760] p0094 N82-10253

ENGINE TESTS
Liquid Hydrogen for automotive vehicles - Experimental results
[ASME PAPER 81-HT-83] p0083 A82-10968
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] p0107 N82-12251

ENGINEERING MANAGEMENT
Macro-engineering: The rich potential; Proceedings of the Third Symposium, San Francisco, CA, January 6, 1980
p0006 A82-18643

ENGINES
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] p0107 N82-12251

ENTHALPY
Enthalpy measurement of coal-derived liquids
[DE81-029481] p0097 N82-10939

ENVIRONMENT EFFECTS
Environmental factors of power satellites
p0002 A82-12505
Aspects concerning the safety of hydrogen
p0085 A82-17132
Methodology for determining the impact of environmental regulatory programs
[DE81-903429] p0009 N82-10594
Economic and environmental tradeoffs in coal conversion
[CONF-800608-8] p0009 N82-10598
Coal fly ash: A review of the literature and proposed classification system with emphasis on environmental impacts
[PB81-215010] p0009 N82-10608
Near-term goals for alcohol fuels from biomass: An overview of resource requirements, land use, environmental, and socioeconomic impacts --- ethyl alcohol production
[DE81-029987] p0010 N82-11245
Assessment of oil-shale technology in Brazil
[DE81-027574] p0010 N82-11249
Advanced-gasification processes
[DE81-030184] p0102 N82-11254
Environmental research plan for gas supply technologies. Volume 2: Environmental research plan
[PB81-222317] p0011 N82-11274

Plan for technological research and development related to the petroleum activities on the Norwegian Continental Shelf. 1981-1985: Appendixes: 1. Technical challenges. 2. Research requirements. 3. High priority programs
[DE81-904014] p0104 N82-11520
Great Plains gasification project, Mercer County, North Dakota; water assessment report section 13(c)
[PB81-216111] p0013 N82-11524
Great Plains gasification project, Mercer County, North Dakota; water assessment report
[PB81-216129] p0013 N82-11525
Solid and hazardous energy wastes: Synfuels. 1: Review of research activities
[DE81-028503] p0014 N82-11644
Environmental research plan for gas supply technologies. Volume 1: Executive summary
[PB81-222309] p0015 N82-11657
Computer models to support investigations of surface subsidence and associated ground motion induced by underground coal gasification
[DE81-027131] p0015 N82-11712
National coal-market conditions for the year 2000: Regional-issue identification and analysis, high scenario
[DE81-026425] p0016 N82-11988
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] p0018 N82-12587
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] p0019 N82-12635
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030822] p0020 N82-12661
Technology characterizations: Environmental information handbook, second edition
[DE81-029993] p0021 N82-12671
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] p0021 N82-12765
Environmental and economic comparison of advanced processes for conversion of coal and biomass into clean energy
[PB81-234239] p0023 N82-13256
Residual-energy-applications program environmental analysis report --- industrial scale waste heat recovery equipment and utilization
[DE81-027538] p0024 N82-13525
Technology assessment of solar energy systems: Availability and impacts of woody biomass utilization in the Pacific Northwest
[DE82-000705] p0024 N82-13535
Compressed air energy storage: Preliminary design and site development program in an aquifer. Volume 2: Utility system planning
[DE82-000466] p0159 N82-13544
Environmental impacts of energy transportation
[DE82-900316] p0025 N82-13559
Environmental hazard rankings of pollutants generated in coal gasification processes
[PB81-231698] p0026 N82-13576
Environmental assessment of the Alaskan Continental Shelf: Annual reports of principal investigators for the year ending March 1980. Volume 5: Hazards
[PB81-225732] p0026 N82-13607
Coal conversion solid waste disposal
[DE81-028567] p0116 N82-14680
Pollution of the soil by aviation gasoline
[PML-1979-41] p0032 N82-15596
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] p0032 N82-15598
Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] p0034 N82-15623
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] p0034 N82-15637

ENVIRONMENT MANAGEMENT

Energy technologies and the environment. Environmental information handbook
[DE81-029809] p0020 N82-12660
Technology characterizations: Environmental information handbook, second edition
[DE81-029993] p0021 N82-12671

ENVIRONMENT MODELS

Case studies in the application of air quality modelling in environmental decision making: Summary and recommendations
[PB81-213233] p0009 N82-10605

ENVIRONMENT POLLUTION

Oil and gas industry and environmental pollution: Application of systems reliability analysis for the evaluation of the status of environmental pollution control in the Nigerian petroleum industry
p0008 N82-10583
Environmental assessment of the Alaskan Continental Shelf: Annual reports of principal investigators for the year ending March 1980. Volume 5: Hazards
[PB81-225732] p0026 N82-13607
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] p0034 N82-15637

ENVIRONMENT PROTECTION

The electric utility 4.5 MW fuel cell power plant - An urban demonstration
p0131 A82-15070
Relaxing environmental standards during oil-supply disruptions: Past, present and future
[DE81-024250] p0009 N82-10601
Intergrated assessment for energy-related environmental standards: A summary of issues and findings
[DE81-028552] p0014 N82-11646
Feasibility analysis of trench strip and auger mining
[DE81-027557] p0017 N82-12521
Application of different KFA-models in the framework of the energy research programme of the European Communities
[EUR-6758-EN] p0019 N82-12597
Environmental readiness document. Advanced Isotope Separation Program
[DE81-029952] p0029 N82-14900

ENVIRONMENTAL CONTROL

Electric and hybrid vehicles environmental control subsystem study
[NASA-CR-164995] p0020 N82-12657
Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] p0020 N82-12658

ENVIRONMENTAL ENGINEERING

Macro-engineering: The rich potential; Proceedings of the Third Symposium, San Francisco, CA, January 6, 1980
p0006 A82-18643

ENVIRONMENTAL MONITORING

INEL geothermal environmental program
[DE81-025671] p0008 N82-10591
Coal gasifier parameters influencing environmental pollutant production
[PB81-221301] p0011 N82-11273
Environmental data for sites in the National Solar Data Network
[DE82-000071] p0075 N82-12707
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0027 N82-14557
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0030 N82-15488

ENVIRONMENTAL QUALITY

Environmental compliance program handbook
[DE81-030226] p0008 N82-10585
Case studies in the application of air quality modelling in environmental decision making: Summary and recommendations
[PB81-213233] p0009 N82-10605
Environmental and radiological safety studies: Interaction of (238) PuO2 heat sources with terrestrial and aquatic environments
[DE81-032019] p0025 N82-13565
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] p0034 N82-15637

ENVIRONMENTAL SURVEYS
Solvent-Refined Coal-1 Demonstration Project. Final environmental impact statement, Volume 1 of 2 --- coal liquefaction plant at Newman, Kentucky
[DE81-025983] p0010 N82-11252
ENZYME ACTIVITY
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production
p0107 N82-12236
EPITAXY
Efficient Si solar cells by low-temperature solid-phase epitaxy
p0043 A82-11344
Production and certain properties of photoelectric cells based on silicon epitaxial structures
p0053 A82-13716
Effects of heat treatment on epitaxial silicon solar cells on metallurgical silicon substrates
p0058 A82-16469
EQUATIONS OF MOTION
An aeroelastic analysis of the Darrieus wind turbine
[AIAA PAPER 81-2572] p0129 A82-14029
Analytical solution of a simulation model for wind turbines
p0132 A82-16600
EQUATIONS OF STATE
Development of a thermodynamic properties correlation framework for the coal conversion industry, phase 1A
[DE81-030363] p0111 N82-12985
EQUIVALENT CIRCUITS
A practical method of analysis of the current-voltage characteristics of solar cells
p0051 A82-12823
EROSIVE BURNING
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] p0033 N82-15609
ESTIMATES
Venezuela, Trinidad and Tobago: Crude oil potential from known deposits
[DE81-027023] p0096 N82-10474
ETCHING
Sputter etched metal solar selective absorbing surfaces for high temperature thermal collectors
p0057 A82-16057
ETHYL ALCOHOL
Enthanol fuels from biomass projects
p0089 A82-11837
Feasibility of solar assisted ethanol production
[AIAA PAPER 81-2533] p0054 A82-14004
Near-term goals for alcohol fuels from biomass: An overview of resource requirements, land use, environmental, and socioeconomic impacts --- ethyl alcohol production
[DE81-029987] p0010 N82-11245
Ethanol production in southern tier east region of New York: Technical and economic feasibility
[PB81-226979] p0011 N82-11275
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production
p0107 N82-12236
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] p0107 N82-12250
Feasibility study report for the Imperial Valley Ethanol Refinery: A 14.9-million-gallon-per-year ethanol synfuel refinery utilizing geothermal energy
[DE82-000288] p0112 N82-13252
Alcohol fuels grant program at Lincoln Land Community College, Springfield, Illinois
[DE82-000744] p0114 N82-14375
Feasibility study for an alcohol-fuels plant for Buffalo, New York
[DE82-000032] p0114 N82-14377
The utilisation of alcohol in light duty diesel engines
[PB81-244469] p0118 N82-15452
EUROPE
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] p0119 N82-15656
EUROPEAN SPACE AGENCY
Economic effects induced by ESA contracts, phase 2. Volume 1: Summary
[ESA-CR(P)-1462-VOL-1] p0161 N82-14981
EVAPORATION
Evaporative hydrocarbon emissions from a large vehicle population
p0004 A82-14442
EVAPORATION RATE
Effect of wick dryness on the performance of heat pipes with separate channels
p0005 A82-16272
EVAPORATORS
Measured performance of falling-jet flash evaporators
[DE81-024355] p0161 N82-10565
High efficient collector for small solar-powered facilities
[BMFT-FB-T-81-156] p0080 N82-15538
EXCAVATION
Longwall mining of thin seams
[DE81-028042] p0116 N82-14612
EXHAUST EMISSION
Evaporative hydrocarbon emissions from a large vehicle population
p0004 A82-14442
Dimethyl sulfate in particulate matter from coal- and oil-fired power plants
p0005 A82-16199
Soot formation in synthetic fuel droplets
[DE81-028391] p0092 N82-10150
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] p0006 N82-10254
Informational report on the measurement and characterization of diesel exhaust emissions
[PB81-221251] p0009 N82-11175
Low-Btu-gasifier emissions toxicology
[DE81-031000] p0014 N82-11651
FGDIS primer: Major equipment/component classifications, problem/solution access codes, and definitions related to FGD systems as contained in the Flue Gas Desulfurization Information System (FGDIS)
[PB81-225948] p0016 N82-11985
Evaluation of the micro-carburetor
[NASA-CR-164958] p0016 N82-11994
AGT-102 automotive gas turbine
[NASA-CR-165353] p0140 N82-12444
Control of hydrocarbons and carbon monoxide via catalytic incineration
[DE82-000508] p0025 N82-13560
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] p0118 N82-15233
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] p0034 N82-15621
EXHAUST GASES
Cyclone performance estimates f r pressurized fluidized-bed combustion --- combined cycle power generation
[DE81-028504] p0093 N82-10156
EPA utility FGD (Flue Gas Desulfurization) survey
[PB81-225773] p0015 N82-11679
Selected studies of four high-temperature air-pollution sources
p0015 N82-11680
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] p0107 N82-12251
Control of hydrocarbons and carbon monoxide via catalytic incineration
[DE82-000508] p0025 N82-13560
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] p0034 N82-15621
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] p0035 N82-15651
EXHAUST SYSTEMS
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626
EXPANSION
Design and development of a reciprocating low-temperature freon expander
[DE81-028609] p0023 N82-13392

EXPERIMENTAL DESIGN
LLNL underground coal gasification project
[DE81-030634] p0103 N82-11267
EXPERIMENTATION
Soviet UCG experience specifically related to field experiments in the United States
[DE81-028642] p0111 N82-13244
EXPLORATION
Exploration of coal and anthracitic carbonaceous shale resources, Narragansett Basin, Massachusetts, and Rhode Island
[DE81-030895] p0104 N82-11523
EXTRACTION
Soviet UCG experience specifically related to field experiments in the United States
[DE81-028642] p0111 N82-13244

F

FABRICATION
Research activities of solar cells in ROC
p0047 A82-11795
n-/indium tin oxide//p-InP solar cells
p0058 A82-16471
Low cost silicon-on-ceramic photovoltaic solar cells
p0059 A82-17098
Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 N82-10490
Thin film photovoltaic devices
p0063 N82-10491
Silicon solar cell process development, fabrication and analysis
[NASA-CR-163787] p0063 N82-10500
Integrated function nonimaging concentrating collector tubes for solar thermal energy
[DE81-029677] p0064 N82-10521
Fabrication, testing, and modeling plans for a 125-kW counter-rotating-turbine wave energy converter
[DE81-023946] p0137 N82-10559
Solar cell development for the power extension package
[NASA-TM-82685] p0068 N82-11551
Low-cost solar flat-plate-collector development
[DE81-025081] p0070 N82-11584
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS
p0148 N82-12558
High resolution, low cost solar cell contact development
[NASA-CR-165032] p0076 N82-13501
FACTOR ANALYSIS
Solar panel current degradation factors
p0045 A82-11759
FAILURE
Millions wasted trying to develop major energy information system
[AFMD-81-40] p0029 N82-14959
FAILURE ANALYSIS
Performance of terrestrial photovoltaic modules at MIT Lincoln Laboratory experimental photovoltaic systems
[DE81-029995] p0064 N82-10519
Rectenna array measurement results
p0149 N82-12564
Asymmetric stress and failure analysis
[DE81-026842] p0142 N82-13451
FAILURE MODES
Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] p0117 N82-15221
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] p0144 N82-15454
FARADAY EFFECT
A design for an MHD power plant as a prime mover for a Naval Vessel
[AIAA PAPER 81-2575] p0129 A82-14032
FARM CROPS
Energy balance and utilization of agricultural waste on a farm
[PB81-229262] p0115 N82-14385
FATIGUE TESTS
An overview of fatigue failures at the Rocky Flats Wind System Test Center
p0125 A82-11828
FATTY ACIDS
A protective additive for jet fuels
p0090 A82-12022
FAULT TREES
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] p0144 N82-15454
FEASIBILITY ANALYSIS
Present status of Florida Power Corporation's D.O.E. funded feasibility study of the Higgins plant repowering/coal gasification project
p0089 A82-11834
Aquifer thermal energy storage - A feasibility study for large scale demonstration
p0154 A82-11846
Feasibility of a small scale pumped storage demonstration project, Hibbing, Minnesota
[DE81-028678] p0155 N82-10525
The young solar collector: An evaluation of its multiple farm uses
[PB81-214132] p0066 N82-10577
Low/medium-Btu coal-gasification assessment program for specific sites of two New York utilities
[DE81-025518] p0101 N82-11240
Peat biogasification development program
[DE81-028299] p0101 N82-11243
Ethanol production in southern tier east region of New York: Technical and economic feasibility
[PB81-226979] p0011 N82-11275
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] p0018 N82-12587
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] p0019 N82-12635
Feasibility study report for the Imperial Valley Ethanol Refinery: A 14.9-million-gallon-per-year ethanol synfuel refinery utilizing geothermal energy
[DE82-000288] p0112 N82-13252
Feasibility study for an alcohol-fuels plant for Buffalo, New York
[DE82-000032] p0114 N82-14377
Evaluation of coal gasification/combined cycle power plant feasibility at the Sewells Point Naval Complex, Norfolk, Virginia
[AD-A103674] p0116 N82-14639
Moorhead district heating, phase 2
[DE81-029689] p0031 N82-15556
Micro-hydropower in the United States
[DE81-028271] p0031 N82-15567
FEDERAL BUDGETS
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] p0073 N82-12609
FEEDBACK CONTROL
Frequency response analysis of fluid control systems for parabolic-trough solar collectors
[DE81-029293] p0064 N82-10513
FERTILIZERS
Process for removing sulfur oxides from gases with direct production of a usable finished reaction product --- ammonium sulfate fertilizer
[BMFT-FB-T-81-102] p0029 N82-15142
FIBER COMPOSITES
Dynamic stability of stacked disk type flywheels
[DE81-030008] p0156 N82-10535
SOL-CYCLE: A solar-assisted solvent-recycling process for asphalt-impregnation of fiber board
[DE81-903377] p0070 N82-11615
FIBER OPTICS
SPS fiber optic link assessment
p0147 N82-12550
FIBER ORIENTATION
Optimum reinforcement shapes and paths for rotating composite shells
p0154 A82-14513
FIELD EFFECT TRANSISTORS
SPS solid state antenna power combiner
p0149 N82-12567
FIGURE OF MERIT
Photoacoustic figure of merit for photothermal energy conversion efficiency
p0121 A82-10192
Finite Lambertian source analysis of concentrators - Application to solar reflectors
p0060 A82-17294

FILTRATION
Techniques for geothermal liquid sampling and analysis
[DE81-030151] p0098 N82-11149
FINANCIAL MANAGEMENT
Status of the Great Plains coal gasification plant
[EMD-81-64] p0107 N82-12242
FINES
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] p0033 N82-15610
FINITE ELEMENT METHOD
Calculation of natural modes of vibration for rotor blades by the finite element method
[DFVLR-FB-81-07] p0136 N82-10452
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] p0032 N82-15602
FINLAND
Sulfur in the air in the capital (Helsinki) metropolitan area: ITASAT-project
[BR-614.71] p0025 N82-13553
FIRE PREVENTION
Fire-protection research for energy technology: Fy 80 year end report
[DE82-000970] p0161 N82-14649
FISHERIES
The Seasat commercial demonstration program p0115 N82-14561
FIXED WINGS
Wing design for light transport aircraft with improved fuel economy p0004 A82-14416
FLAME TEMPERATURE
Soot formation in synfuels
[DE81-030273] p0099 N82-11164
FLASH POINT
Controlled-flash pyrolysis
[DE82-000284] p0111 N82-13196
FLASHING (VAPORIZING)
Measured performance of falling-jet flash evaporators
[DE81-024355] p0161 N82-10565
External fuel vaporization study
[NASA-CR-165513] p0114 N82-14371
FLAT PLATES
The effect of inclination on the heat loss from flat-plate solar collectors p0043 A82-11212
Optimization of heat losses in normal and reverse flat-plate collector configurations - Analysis and performance p0050 A82-16744
Solar project description for Public Service Company of New Mexico (lot 7) single family residence, Rio Rancho, New Mexico
[DE81-027853] p0063 N82-10509
The young solar collector: An evaluation of its multiple farm uses
[PB81-214132] p0066 N82-10577
Solar energy system performance evaluation: Forest City Dillon, Washington, D.C., January 1980 - December 1980
[DE81-028174] p0068 N82-11560
Solar energy system performance evaluation: Montecito Pines, Santa Rosa, California, November 1979 - April 1980
[DE81-028175] p0068 N82-11561
Low-cost solar flat-plate-collector development
[DE81-025081] p0070 N82-11584
Improvement of thermal efficiency of flat plate solar collectors
[BMFT-FB-T-80-194] p0075 N82-12642
A Module Experimental Process System Development Unit (MEPSDU)
[NASA-CR-165014] p0076 N82-13496
Flat-plate solar array project. Task 1: Silicon material: Investigation of the hydrochlorination of SiC1sub4
[NASA-CR-165042] p0078 N82-14631
FLIGHT CONTROL
The role of avionics in the all electric airplane
[AIAA 81-2219] p0002 A82-13457
The all-electric airplane - A new trend p0006 A82-17420
FLIGHT PLANS
Computer flight planning for fuel efficiency p0006 A82-17289
The use of flight management computers in air carrier operations in the 1980s
[AD-A105621] p0027 N82-14071
FLIGHT TESTS
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
FLORIDA
Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1
[DE82-000808] p0019 N82-12613
FLOW CHARACTERISTICS
One-dimensional equilibrium-chemistry flow model for coal combustors
[DE81-027622] p0099 N82-11158
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
FLOW DISTRIBUTION
Effect of inhomogeneous flow distribution in a system of heat-generating solar collectors p0044 A82-11423
Flow in geothermal wells. Part 4: Transition criteria for two-phase flow patterns
[DE81-028312] p0096 N82-10366
FLOW GEOMETRY
Optimization of flow passage geometry for air-heating, plate-type solar collectors p0055 A82-14846
FLOW MEASUREMENT
H-Coal product physical properties measurement
[DE81-029095] p0111 N82-13245
Numerical wind-speed simulation model
[DE82-000956] p0113 N82-13627
FLOW STABILITY
Boiling flow instability of a fixed mirror distributed focus solar receiver p0041 A82-10810
FLOW VELOCITY
Techniques for geothermal liquid sampling and analysis
[DE81-030151] p0098 N82-11149
Cool-down flow-rate limits imposed by thermal stresses in LNG pipelines
[DE81-028731] p0150 N82-14484
FLOWMETERS
Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] p0108 N82-12262
FLUES
EPA utility FGD (Flue Gas Desulfurization) survey
[PB81-225773] p0015 N82-11679
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] p0031 N82-15514
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] p0035 N82-15651
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] p0035 N82-15652
FLUID FLOW
Boiling flow instability of a fixed mirror distributed focus solar receiver p0041 A82-10810
Frequency response analysis of fluid control systems for parabolic-trough solar collectors
[DE81-029293] p0064 N82-10513
FLUIDICS
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
FLUIDIZED BED PROCESSORS
An overview of fluidized-bed combustion /FBC/ design practice p0090 A82-11850
Cyclone performance estimates for pressurized fluidized-bed combustion --- combined cycle power generation
[DE81-028504] p0093 N82-10156
Particulate processes in pulverized-coal flames
[DE81-025153] p0093 N82-10157

Studies of the regeneration of activated bauxite used as granular sorbent for the control of alkali vapors from hot flue gas of coal combustion
[DE81-030192] p0008 N82-10590
Fluidized bed coal combustion reactor
[NASA-CASE-NPO-14273-1] p0097 N82-11144
Assessment of advanced coal gasification processes
[NASA-CR-164949] p0098 N82-11146
Tennessee Valley Authority atmospheric fluidized-bed combustor simulation
[DE81-030262] p0098 N82-11151
Atmospheric fluidized-bed projects technology overview
[DE81-027143] p0102 N82-11251
Surface coal gasification
[DE81-030183] p0102 N82-11253
Lewis Research Center's coal-fired, pressurized, fluidized-bed reactor test facility
[NASA-TM-81616] p0103 N82-11397
Fluid-bed heat-exchanger optimization and bed materials selection
[DOE/ET-11343/T2] p0104 N82-11571
Industrial application of fluidized-bed combustion
[DE81-030272] p0105 N82-12182
Thermal processing of used catalysts
[BMFT-FB-T-80-189] p0016 N82-12205
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] p0108 N82-12260
Energy recovery from municipal waste development program for Idaho Falls, Idaho
[DE81-029999] p0028 N82-14659
Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] p0117 N82-15222
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] p0033 N82-15609
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] p0035 N82-16012

FLUORIDES

Performance of a cylindrical phase change thermal energy storage unit
[AIAA PAPER 82-0076] p0155 A82-17770

FLUOROPOLYMERS

Development status of the General Electric solid polymer electrolyte water electrolysis technology --- hydrogen production
p0083 A82-11787

FLUTTER ANALYSIS

An aeroelastic analysis of the Darrieus wind turbine
[AIAA PAPER 81-2572] p0129 A82-14029

FLUX DENSITY

A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] p0140 N82-12537

FLY BY WIRE CONTROL

The all-electric airplane - A new trend
p0006 A82-17420

FLYWHEELS

Method of determining the creep characteristics of composite materials
p0154 A82-11779
Energy conservation through utilization of mechanical energy storage
p0002 A82-11845
Optimum reinforcement shapes and paths for rotating composite shells
p0154 A82-14513
Mechanical energy storage technology project
[DE81-029753] p0155 N82-10508
ORSYS: A simulation tool for nonconventional energy applications analysis. Theoretical and operational description with user documentation
[DE81-029701] p0007 N82-10514
Dynamic stability of stacked disk type flywheels
[DE81-030008] p0156 N82-10535
Composite flywheel balance experience
[DE81-769341] p0157 N82-10549
Testing and evaluation of a solar photovoltaic flywheel energy storage system
[DOE/ET-20279/130] p0065 N82-10558
Mechanical Energy Storage Technology (MEST) development
[DE81-026000] p0158 N82-11596
Assessment of flywheel system benefits in selected vehicle applications
[DE81-025976] p0158 N82-11997
Flywheel rotor and containment technology development
[DE81-028047] p0159 N82-14655

FOAMING

Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523

FOAMS

Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209

FOCUSING

The Rogers focusing heliostat experimental program at Rensselaer Polytechnic Institute
[PB81-226813] p0071 N82-11525

FOOD PROCESSING

Energy expenditure and dietary change
[PB81-218471] p0009 N82-10717

FORECASTING

Utility operating strategy and requirements for the wind power forecast
[AIAA PAPER 81-2539] p0127 A82-14007
US energy strategies: Some options for eliminating oil imports by the year 2000
[PB81-226052] p0014 N82-11626
Models for forecasting energy use in the US farm sector
[DE81-904220] p0018 N82-12580

FOREST MANAGEMENT

Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

FORMATIONS

Comparison of Michigan Basin crude oils
p0091 A82-17007

FORMING TECHNIQUES

Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS
p0148 N82-12558

FOSSIL FUELS

Overview of DOE's large stationary Stirling engine development program
p0123 A82-11805
An overview of peat gasification
p0089 A82-11848
Liquid fossil fuel technology
[DE81-029912] p0094 N82-10250
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] p0006 N82-10254
Water-cooled gas turbine development program
[DE81-904245] p0136 N82-10406
Feasibility of a small scale pumped storage demonstration project, Hibbing, Minnesota
[DE81-028678] p0155 N82-10525
Computational tools for pulverized-coal combustion
[DE81-028582] p0098 N82-11148
Preliminary evaluation of advanced coal-based electricity-generating technologies by means of system-integration analysis
[DE81-029989] p0105 N82-11573
Survey of particulate emission macro- and micro-sampling and sizing methods
[DE81-028348] p0014 N82-11642
Solid and hazardous energy wastes: Synfuels. 1: Review of research activities
[DE81-028503] p0014 N82-11644
Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] p0074 N82-12624
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] p0021 N82-12765
Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry
[DE81-027965] p0023 N82-13192
Development of peatlands in northern Minnesota
[DE82-000873] p0112 N82-13475
Design and test of two-step solar oil shale retort
[DE82-000964] p0077 N82-13543

Update on Specified European R and D Efforts. Part 1: Appendices
[DE81-026404] p0143 N82-13983
Fuels and chemicals made from solar energy
[DE81-025018] p0077 N82-14384
Fundamentals of nitric oxide formation in fossil-fuel combustion
[DE81-030329] p0033 N82-15608

FRACTIONATION
Cryogenic methane separation/catalytic hydrogasification process analysis
[DE81-029123] p0093 N82-10152
Process development for improved SRC options. Kerr-McGee critical solvent deashing and fractionation studies
[DE81-903765] p0114 N82-14380

FRACTIONS
Identification and toxicity of fractionated-shale-oil components
[DE81-028460] p0021 N82-12766

FRACTURE MECHANICS
Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209

FRACTURE STRENGTH
Dimensions, volume 65, number 3
[PB81-235053] p0161 N82-15436

FRACTURING
Hot dry rock geothermal energy development program
[LA-UR-81-1265] p0097 N82-10560

FREON
Design and development of a reciprocating low-temperature freon expander
[DE81-028609] p0023 N82-13392

FREQUENCY CONTROL
Control of new energy sources in an electric utility system
p0154 A82-13082

FREQUENCY STABILITY
Wind-energy recovery by a static Scherbius induction generator
p0131 A82-15650

FRESNEL LENSES
Efficiency of Fresnel lenses
p0043 A82-11387
Chromatic aberration effect on solar energy systems using Fresnel lenses
p0052 A82-13284
Theoretical analysis of the Fresnel lens as a function of design parameters --- for solar concentrators
p0059 A82-16599
Automated Fresnel lens tester system
[DE81-029483] p0066 N82-10863

FRESNEL REFLECTORS
Secondary and compound concentrators for parabolic dish solar thermal power systems
[NASA-CR-164960] p0068 N82-11550

FUEL CELLS
The nickel-hydrogen battery system - An historical overview
p0153 A82-11735
The Texas Instruments Solar Energy System development
p0047 A82-11773
Evaluation of organic acids as fuel cell electrolytes
p0127 A82-12938
Carbonate fuel cell power plant systems
p0131 A82-15069
Design of a cell for electrode kinetic investigations of fuel cell reactions
p0136 A82-18394
Fundamental investigations on fuel cells for transportation applications
p0137 N82-10493
Rechargeable molten-salt cells
[DE81-027091] p0158 N82-11595
Energy savings by means of fuel-cell electrodes in electro-chemical industries
[DE81-030975] p0018 N82-12582
Asymmetric stress and failure analysis
[DE81-026842] p0142 N82-13451
Develop and test fuel cell powered on-site integrated total energy system. Phase 3: Full-scale power plant development
[NASA-CR-165328] p0142 N82-13490
Investigation of the in-situ oxidation of methanol in fuel cells
[AD-A105947] p0143 N82-14642
Future of electricity for automobiles: Advanced electric vehicle concepts
[DE81-028235] p0029 N82-14987

FUEL COMBUSTION
Characteristics of combustion and pollutant formation in swirling flames
p0001 A82-10875
Conceptual design of 500 to 3000 hp Stirling engines for stationary power generation
p0123 A82-11807
An overview of fluidized-bed combustion /FBC/ design practice
p0090 A82-11850
Study of the electric conductivity of plasma from fuel combustion products containing a weakly ionizing impurity
p0091 A82-12888
Synthetic-fuel combustion; pollutant formation. Soot-initiation mechanisms in burning aromatics
[DE81-029480] p0093 N82-10155
Pulverized-fuel combustion: Modeling and scaleup methodologies
[DE81-026546] p0093 N82-10150
Study of the formation of submicron particulates generated by coal combustion
[DE81-027447] p0008 N82-10586
Atmospheric fluidized-bed projects technology overview
[DE81-027143] p0102 N82-11251
Workshop proceedings: Combustion Turbine Residual Oil
[EPRI-WS-80-132] p0103 N82-11261
Third automotive fuel economy research contractors coordination meeting
[PB81-222754] p0014 N82-11627
Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char
p0105 N82-12156
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] p0107 N82-12251
Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry
[DE81-027965] p0023 N82-13192
Environmental effects of pollutants from coal combustion. 2: The Colstrip, Montana Power Plant
[PB81-234114] p0026 N82-13573

FUEL CONSUMPTION
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles
p0001 A82-10495
A hidden advantage of permanent magnet electrical generating systems
p0122 A82-11720
Energy conservation through utilization of mechanical energy storage
p0002 A82-11845
Fuel conservation - DC-9 series 20/30/40
p0002 A82-12563
Fuel efficient flight profiles in an ATC flow management environment
p0002 A82-13078
Wing design for light transport aircraft with improved fuel economy
p0004 A82-14416
The all electric airplane - Its development and logistic support
p0004 A82-14709
Fuel conservation measures in South African airways - A review of activity and a glimpse of future developments
p0004 A82-15598
Ceramics for the AGT101 automotive gas turbine
p0132 A82-16827
Fuel conservation now --- improvements for existing production run transport aircraft
p0005 A82-17281
Energy savings with today's technology --- aircraft fuel management through in-flight monitoring
p0005 A82-17282
Computer flight planning for fuel efficiency
p0006 A82-17289
The all-electric airplane - A new trend
p0006 A82-17420
Energy consumption and heavy-duty vehicles --- tractor trucks
p0008 N82-10573

EPA evaluation of the FUEL-MAX device under Section 511 of the Motor Vehicle Information and Cost Savings Act
[PB81-229866] p0012 N82-11479
EPA evaluation of the Automotive Cylinder Deactivator System (ACDS) under Section 511 of the Motor Vehicle Information and Cost Saving Act
[PB81-228256] p0013 N82-11480
Evaluation of the micro-carburetor
[NASA-CR-164958] p0016 N82-11994
AGT-102 automotive gas turbine
[NASA-CR-165353] p0140 N82-12444
National interim energy-consumption survey: Exploring the variability in energy consumption
[DE81-029910] p0018 N82-12589
Performance analysis of 11 Denver Metro passive homes
[DE81-025473] p0074 N82-12626
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis Memorandum no. 1
[DE81-030841] p0020 N82-12667
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 1: Summary
[PB81-219479] p0022 N82-13018
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 2: Appendices A through C
[PB81-219487] p0022 N82-13019
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities. Volume 3: Appendix D
[PB81-219495] p0022 N82-13020
Performance characteristics of automotive engines in the United States, third series: 1977 Chrysler 318 CID (5.2L), 2V
[PB81-233025] p0023 N82-13435
Controlled Speed Accessory Drive demonstration program
[NASA-CR-165010] p0026 N82-13981
Evaluation of techniques for reducing in-use automotive fuel consumption
[PB81-233298] p0026 N82-13985
Highway fuel economy study
[PB81-233850] p0026 N82-13986
The use of flight management computers in air carrier operations in the 1980s
[AD-A105621] p0027 N82-14071
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] p0030 N82-15453
Fuels and electric energy consumed
[PB81-240442] p0032 N82-15594

FUEL CORROSION

A protective additive for jet fuels
p0090 A82-12022

FUEL FLOW

Transport characteristics of alternate slurry fuels
[DE81-028580] p0146 N82-11255

FUEL INJECTION

A study of factors influencing thermally induced backfiring in hydrogen fueled engines, and methods for backfire control
p0084 A82-11791
External fuel vaporization study
[NASA-CR-165513] p0114 N82-14371

FUEL OILS

Dimethyl sulfate in particulate matter from coal- and oil-fired power plants
p0005 A82-16199
Flame-retention head burner efficiency test results and analysis: Space-heating-equipment test program
[DE81-030219] p0093 N82-10153
Workshop proceedings: Combustion Turbine Residual Oil
[EPRI-WS-80-132] p0103 N82-11261
Coal-oil mixtures: An alternative fuel for the commercial markets and large residential markets
[DE81-028335] p0114 N82-14379
Thermochemical production of liquids from biomass
[DE81-030085] p0117 N82-15226

FUEL PRODUCTION

Fuel for future transport aircraft
[ASME PAPER 81-HT-80] p0089 A82-10965
Agricultural policies and biomass fuels
p0001 A82-11542
Ethanol fuels from biomass projects
p0089 A82-11837
Production of synthetic crude oil from coal using the TOSCOAL pyrolysis process
p0090 A82-11849
Biomass resources for alcohol fuels
p0090 A82-12533
Feasibility of solar assisted ethanol production
[AIAA PAPER 81-2533] p0054 A82-14004
Alternative ocean energy products and hybrid geothermal-OTEC /GEOTEC/ plants
[AIAA PAPER 81-2547] p0128 A82-14012
Fuels from biomass and wastes --- Book
p0091 A82-14986
Fuel and energy --- Book
p0004 A82-15589
Biomass conversion processes for energy and fuels --- Book
p0092 A82-18114
Selectivity in Fischer-Tropsch synthesis: Review and recommendations for further work
[PB81-223596] p0095 N82-10271
Advanced system experimental facility: Solid waste to methane gas. Background and process description
[DE81-030198] p0101 N82-11244

[DE81-029956] p0028 N82-14664
Fuels and electric energy consumed
[PB81-240442] p0032 N82-15594

FUEL PUMPS

A LH2 engine fuel system on board - Cold GH2 injection into two-stroke engine with LH2 pump
[ASME PAPER 81-HT-81] p0083 A82-10966

FUEL TESTS

Optimization of the composition and antidetonation properties of AI-93 gasoline
p0091 A82-15722
Low/medium Btu coal gasification assessment program for potential users in New Jersey: Executive summary
[DE81-025475] p0111 N82-13247

FUELS

Experimental evaluation of the steady-state and dynamic performance characteristics of the interactive units of a coal-gasification process
[DE81-028995] p0094 N82-10259
Thermophysical properties of coal liquids
[DE81-027946] p0097 N82-10938

Chemistry and catalysis of coal liquefaction: Catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels [DOE/ET-14700/1] p0102 N82-11259
Chemistry and catalysis of coal liquefaction: Catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels [DOE/ET-14700/2] p0102 N82-11260
NASEC industrial fuel-wood program [DE82-000461] p0110 N82-12595
Biomass energy utilization in the Pacific Northwest: Impacts associated with residential use of solid fuels [DE81-029137] p0115 N82-14383

FUNCTIONAL DESIGN SPECIFICATIONS
Residual-energy-application program: EAST facility requirements document, volume 1 [DE81-027536] p0142 N82-13526

FURANS
Thermolysis of naphthols [DE81-029684] p0116 N82-15152

FURNACES
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment [DE81-030039] p0119 N82-15604
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios [DE81-030096] p0033 N82-15613

FUSION REACTORS
Engineering challenges of fusion-reactor development [DE81-024129] p0139 N82-11907
Progress report to the Department of Energy in support of basic energy and policy research [DE81-025882] p0028 N82-14548

G

GALILEO SPACECRAFT
Engineering development testing of the GPHS-RTG converter --- General Purpose Heat Source-Radioisotope Thermoelectric Generator for Galileo orbiter power supply p0122 A82-11752
Nuclear electric power for space systems - Technology background and flight systems program p0123 A82-11756

GALLIUM ARSENIDE LASERS
Laser bonded n-GaAs/p-GaSb heterojunction intercell Ohmic contact p0041 A82-10776

GALLIUM ARSENIDES
Gallium arsenide solar cells-status and prospects for use in space p0046 A82-11765
GaAs solar cells for space application p0046 A82-11766
High efficiency thin-film GaAs solar cells p0046 A82-11767
Advanced Satellite Power System /SPS/ concept p0049 A82-11839
Thin-film gallium arsenide homojunction solar cells p0052 A82-13200
A new low temperature III-V multilayer growth technique - Vacuum metalorganic chemical vapor deposition --- of GaAs thin films p0053 A82-13803
Gallium-arsenic-antimony heterojunction photocells p0055 A82-14667
Silicon and gallium arsenide photovoltaic cells - Models for the functioning, experimentation, and application to concentrating collectors --- French thesis p0055 A82-15006
Effects of low temperature periodic annealing on the deep-level defects in 200 keV proton irradiated AlGaAs-GaAs solar cells p0061 A82-18287

GAS CHROMATOGRAPHY
Development and application of analytical techniques to chemistry of donor solvent liquefaction [DE81-029125] p0099 N82-11166
Oil spill identification by chemical analysis p0115 N82-14583

GAS COMPOSITION
Characteristics of combustion and pollutant formation in swirling flames p0001 A82-10875

GAS COOLING
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase [BMFT-FB-T-81-097] p0080 N82-15530

GAS DISCHARGES
Ionization waves in an argon discharge in a longitudinal gas flow p0127 A82-12666

GAS DISSOCIATION
An experimental study of SO3 dissociation as a mechanism for converting and transporting solar energy p0043 A82-11214
Small-scale uses and costs of hydrogen derived from OTEC ammonia p0084 A82-11792
Brayton cycle using dissociating nitrosyl chloride p0126 A82-11852

GAS EVOLUTION
Outgassing of two synthetic fuels [AD-A104580] p0100 N82-11231

GAS FLOW
Controlled Retracting Injection Point (CRIP) system: A modified-stream method for in situ coal gasification [DE81-026477] p0102 N82-11248
Proceedings: Symposium on Flue Gas Desulfurization, volume 2 [PB81-243164] p0035 N82 15652

GAS INJECTION
A LH2 engine fuel system on board - Cold GH2 injection into two-stroke engine with LH2 pump [ASME PAPER 81-HT-81] p0083 A82-10966
Controlled Retracting Injection Point (CRIP) system: A modified-stream method for in situ coal gasification [DE81-026477] p0102 N82-11248

GAS LASERS
A solar simulator-pumped gas laser for the direct conversion of solar energy p0044 A82-11710
Advanced solar energy conversion --- solar pumped gas lasers [NASA-CR-165060] p0079 N82-15526

GAS MIXTURES
The corrosion of some superalloys in contact with coal chars in coal gasifier atmospheres p0091 A82-17974

GAS REACTORS
An overview of peat gasification p0089 A82-11848

GAS RECOVERY
Pricetown 1 underground coal gasification field test: Operations report [DE81-025162] p0095 N82-10268
Solar coal-gasification reactor for hydrocarbon-free synthesis gas [DE81-026600] p0067 N82-11247
Gas recovery from coal deposits [PB81-222291] p0103 N82-11271
Environmental research plan for gas supply technologies. Volume 1: Executive summary [PB81-222309] p0015 N82-11657
Evaluation of landfill gas as an energy source --- feasibility of methane recovery from landfills [DE82-000116] p0110 N82-12584
Development of a metal hydride process for hydrogen recovery from supplemented natural gas [DE81-022685] p0086 N82-14382
High-pressure solvent extraction of methane from geopressured fluids [DE81-027713] p0117 N82-15227
Potential environmental problems of enhanced oil and gas recovery techniques [PB81-240186] p0034 N82-15637

GAS STREAMS
Optical diagnostic techniques for coal-fired MHD applications [AIAA PAPER 82-0377] p0135 A82-17913

GAS TEMPERATURE
Correlation between results of zone method and experiment in radiative heat transfer [ASME PAPER 81-HT-71] p0121 A82-10950

GAS TRANSPORT
Control of utility boiler and gas turbine pollutant emissions by combustion modification, phase 2
[PB81-222267] p0015 N82-11654
GAS TURBINE ENGINES
The AGT101 technology - An automotive alternative p0123 A82-11783
Coal fired air turbine cogeneration p0089 A82-11836
Ceramics for the AGT101 automotive gas turbine p0132 A82-16827
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] p0006 N82-10254
AGT-202 automotive gas turbine
[NASA-CR-165353] p0140 N82-12444
Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] p0140 N82-12572
Development of a high-temperature durable catalyst for use in catalytic combustors for advanced automotive gas turbine engines
[NASA-CR-165396] p0142 N82-13510
External fuel vaporization study
[NASA-CR-165513] p0114 N82-14371
GAS TURBINES
Thermionic combustor application to combined gas and steam turbine power plants p0124 A82-11818
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 2: Hot component corrosion evaluation
[DE81-903760] p0094 N82-10253
Water-cooled gas turbine development program
[DE81-904245] p0136 N82-10406
Workshop proceedings: Combustion Turbine Residual Oil
[EPRI-WS-80-132] p0103 N82-11261
Control of utility boiler and gas turbine pollutant emissions by combustion modification, phase 2
[PB81-222267] p0015 N82-11654
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] p0107 N82-12251
Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] p0141 N82-12592
Update on Specified European R and D Efforts. Part 1: Appendices
[DE81-026404] p0143 N82-13983
GASDYNAMIC LASERS
Ionization waves in an argon discharge in a longitudinal gas flow p0127 A82-12666
GASEOUS FUELS
The significance of hydrogen as future secondary energy carrier p0146 A82-17127
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] p0107 N82-12254
GASIFICATION
Kinetics and catalysis of producing synthetic gases from biomass
[PB81-217614] p0095 N82-10272
Peat biogasification development program
[DE81-028299] p0101 N82-11243
Transportation fuels from synthetic gas
[DE81-029614] p0102 N82-11258
Environmental research plan for gas supply technologies. Volume 2: Environmental research plan
[PB81-222317] p0011 N82-11274
Sulfur pollution control. Phase 1: The disposal program (sections 5 through 7)
[PB81-222804] p0015 N82-11655
GASOHOL (FUEL)
Ethanol production in southern tier east region of New York: Technical and economic feasibility
[PB81-226979] p0011 N82-11275
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] p0107 N82-12250
GASOLINE
Aviation gasoline versus automotive gasoline
[AIAA PAPER 81-1705] p0091 A82-14395
Evaporative hydrocarbon emissions from a large vehicle population p0004 A82-14442
Optimization of the composition and antidetonation properties of AI-93 gasoline p0091 A82-15722
Selectivity in Fischer-Tropsch synthesis: Review and recommendations for further work
[PB81-223596] p0095 N82-10271
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1
[DE81-030841] p0020 N82-12667
Motor gasolines, Winter 1980-81
[DE81-030845] p0117 N82-15224
Pollution of the soil by aviation gasoline
[PNL-1979-41] p0032 N82-15596
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] p0034 N82-15621
GELATION
Study of gelled LNG
[DE81-023259] p0095 N82-10269
GEOCHEMISTRY
Development of organic geochemical and isotope techniques for hydrocarbon exploration
[BMFT-FB-T-80-076] p0097 N82-10482
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] p0109 N82-12517
Evaluation of Devonian shale potential in eastern Kentucky/Tennessee
[DE82-001164] p0116 N82-14595
Exploratory study of coal-conversion chemistry
[DE81-016136] p0119 N82-15552
GEOCHRONOLOGY
Development of peatlands in northern Minnesota
[DE82-000873] p0112 N82-13475
Stratigraphy and depositional history of the Iola Limestone Upper Pennsylvanian (Missourian), Northern Midcontinent U.S. p0116 N82-14711
GEOLOGICAL FAULTS
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] p0119 N82-15656
GEOLOGICAL SURVEYS
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] p0109 N82-12517
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] p0109 N82-12518
Peat resource evaluation: State of Maine
[DE82-000227] p0109 N82-12523
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] p0109 N82-12524
Bibliography of publications dealing with tar sands
[DE81-026146] p0115 N82-14594
Stratigraphy and depositional history of the Iola Limestone Upper Pennsylvanian (Missourian), Northern Midcontinent U.S. p0116 N82-14711
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0118 N82-15489
GEOMETRICAL OPTICS
Geometrical optical performance studies of a composite parabolic trough with a fin receiver p0043 A82-11390
GEOSYNCHRONOUS ORBITS
Transportation systems and cost comparison for launching an SPS into geosynch. orbit p0050 A82-12507

GEOTECHNICAL ENGINEERING
Plan for technological research and development related to the petroleum activities on the Norwegian Continental Shelf. 1981-1985: Appendixes: 1. Technical challenges. 2. Research requirements. 3. High priority programs
[DE81-904014] p0104 N82-11520
Reservoir stability studies
[DE81-030099] p0160 N82-15510
GEOTEMPERATURE
Investigation of direct expansion in ground source heat pumps
[DE81-024139] p0012 N82-11418
GEOTHERMAL ENERGY CONVERSION
Applications of thermoelectrics to geothermal energy conversion
p0125 A82-11824
Alternative ocean energy products and hybrid geothermal-OTEC /GEOTEC/ plants
[AIAA PAPER 81-2547] p0128 A82-14012
Hot dry rock geothermal energy development program
[LA-UR-81-1265] p0097 N82-10560
Water-related constraints to the development of geothermal electric generating stations
[DE81-025138] p0007 N82-10561
Analysis of thermal/mechanical energy-conversion concepts
[DE81-027854] p0139 N82-11585
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] p0109 N82-12516
Workshop proceedings: U-bend tube cracking in steam generators
[DE81-903765] p0142 N82-13515
New and renewable energy in the United States of America
[DE81-030887] p0024 N82-13539
Sandia program in geothermal technology development
[DE81-025394] p0119 N82-15546
GEOTHERMAL ENERGY EXTRACTION
Development of man-made geothermal reservoirs --- extracting heat from hot dry rock
[LA-UR-81-852] p0097 N82-10480
Relaxation of geothermal-reservoir stresses induced by heat production
[DE81-032024] p0105 N82-11715
Accessing the geothermal resources
[DE81-025396] p0116 N82-14614
Sampling and analysis of potential geothermal sites
[PB81-240061] p0119 N82-15593
GEOTHERMAL ENERGY UTILIZATION
Energy technologies and the environment. Environmental information handbook
[DE81-029809] p0020 N82-12660
Feasibility study report for the Imperial Valley Ethanol Refinery: A 14.9-million-gallon-per-year ethanol synfuel refinery utilizing geothermal energy
[DE82-000288] p0112 N82-13252
GEOTHERMAL RESOURCES
Reduced heat flow - Mean heat flow relationship for the continental geothermal provinces
p0089 A82-10372
One-dimensional model of vapor-dominated geothermal systems
p0089 A82-11033
Corrosion testing of carbon steel in aereated geothermal brine
[DE81-028653] p0093 N82-10201
Flow in geothermal wells. Part 4: Transition criteria for two-phase flow patterns
[DE81-028312] p0096 N82-10366
Low-to-moderate temperature geothermal resource assessment for Nevada, area specific studies
[DE81-030487] p0096 N82-10475
Montana geothermal handbook: A guide to agencies, regulations, permits and financial aids for geothermal development
[DE81-024315] p0007 N82-10562
INEL geothermal environmental program
[DE81-025671] p0008 N82-10591
Techniques for geothermal liquid sampling and analysis
[DE81-030151] p0098 N82-11149
Two-phase flow in geothermal energy sources
[DE81-029037] p0103 N82-11404
Is geothermal simulation a catastrophe?
[DE81-026750] p0105 N82-11588
Geothermal environmental assessment: Behavior of selected geothermal brine contaminants in plants and soils
[PB81-222333] p0015 N82-11671
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] p0109 N82-12514
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] p0109 N82-12516
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] p0109 N82-12517
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] p0109 N82-12518
Heat flow studies and geothermal exploration in western Trans-Pecos Texas
p0110 N82-12684
Feasibility study report for the Imperial Valley Ethanol Refinery: A 14.9-million-gallon-per-year ethanol synfuel refinery utilizing geothermal energy
[DE82-000288] p0112 N82-13252
Geothermal-resource verification for Air Force Bases
[DE81-027482] p0112 N82-13520
Accessing the geothermal resources
[DE81-025396] p0116 N82-14614
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0118 N82-15489
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] p0118 N82-15505
Sampling and analysis of potential geothermal sites
[PB81-240061] p0119 N82-15593
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] p0119 N82-15656
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] p0119 N82-15661
GRAD: A tool for program analysis and progress monitoring
[DE81-028098] p0120 N82-15981
GEOTHERMAL TECHNOLOGY
Geothermal systems: Principles and case histories --- Book
p0090 A82-12275
Value tree analysis of energy supply alternatives
[AD-A105629] p0029 N82-14375
Sandia program in geothermal technology development
[DE81-025394] p0119 N82-15546
GERMANIUM
Electrical characteristics of high-voltage germanium photoconverters under high illumination intensities
p0040 A82-10391
Cascade photogenerators based on silicon and germanium matrix photoconverters
p0044 A82-11422
GLASS
Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209
GLASS COATINGS
Analysis of the optical characteristics of solar collectors
p0052 A82-13715
GLASS FIBERS
Conceptual design of a glass-reinforced concrete solar collector
[DE81-029280] p0065 N82-10542
GLOW DISCHARGES
Introduction to basic aspects of plasma-deposited amorphous semiconductor alloys in photovoltaic conversion
p0039 A82-10026
GOVERNMENT/INDUSTRY RELATIONS
Solar explosion
[DE81-026086] p0074 N82-12628
The Seasat commercial demonstration program
p0115 N82-14561

GOVERNMENTS
Building a consensus about energy technologies
[DE82-000501] p0024 N82-13536
GRAIN BOUNDARIES
The optimization of solar conversion devices
p0039 A82-10025
Grain size dependence of the photovoltaic properties of solar grade polysilicon
p0057 A82-16051
Effects of heat treatment on epitaxial silicon solar cells on metallurgical silicon substrates
p0058 A82-16469
GRAVITATION
Theoretical analysis of the performance of a gravity-controlled solar concentrator
p0050 A82-12812
GREAT PLAINS CORRIDOR (NORTH AMERICA)
Great Plains gasification project, Mercer County, North Dakota; water assessment report section 13(c)
[PB81-216111] p0013 N82-11524
Great Plains gasification project, Mercer County, North Dakota; water assessment report
[PB81-216129] p0013 N82-11525
GROUND STATIONS
Coherent multiple tone technique for ground based SPS phase control
p0147 N82-12546
GROUND WATER
Fracture flow of groundwater in coal-bearing strata
[DE81-023810] p0096 N82-10479
Review of simulation techniques for Aquifer Thermal Energy Storage (ATES)
[DE81-029943] p0156 N82-10532
LLNL underground coal gasification project
[DE81-030634] p0103 N82-11267
Coal liquefaction demonstration plant near Morgantown, West Virginia; water assessment report section 13(b)
[PB81-216095] p0103 N82-11269
Coal liquefaction demonstration plant near Morgantown, West Virginia: Water assessment report
[PB81-216103] p0011 N82-11270
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] p0109 N82-12518
Assessment of water supply contamination due to underground coal gasification
[PB81-209215] p0021 N82-12680
Environmental and radiological safety studies: Interaction of (238) PuO2 heat sources with terrestrial and aquatic environments
[DE81-032019] p0025 N82-13565
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] p0034 N82-15624
GROUND WIND
Network wind power over the Pacific northwest. Appendix 1: Wind statistics summaries for the wind power data stations
[DE81-029291] p0112 N82-13518
Wind Power: Research on network wind power over the Pacific northwest. Executive summary
[DE81-029360] p0142 N82-13519
Application of Bayesian analysis for wind energy site evaluation
p0113 N82-13619
GULF OF MEXICO
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] p0117 N82-15225

H

HALL GENERATORS
Loading schemes for a 50 MW/th/ diagonally connected MHD generator
[AIAA PAPER 82-0395] p0135 A82-17923
HANDBOOKS
Environmental compliance program handbook
[DE81-030226] p0008 N82-10565
Technology characterizations: Environmental information handbook, second edition
[DE81-029993] p0021 N82-12671
HAULING
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] p0146 N82-12525
Environmental impacts of energy transportation
[DE82-900316] p0025 N82-13559
HAWAII
Possible use of coal in Hawaii, 1980 - 2000
[DE81-028266] p0010 N82-11263
HAZARDS
Environmental assessment of the Alaskan Continental Shelf: Annual reports of principal investigators for the year ending March 1980. Volume 5: Hazards
[PB81-225732] p0026 N82-13607
HEALTH PHYSICS
Health and safety research division
[DE81-026088] p0026 N82-13652
HEAT BALANCE
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028896] p0030 N82-15242
HEAT EXCHANGERS
Heat Transfer - Milwaukee 1981; Proceedings of the Twentieth National Heat Transfer Conference, Milwaukee, WI, August 2-5, 1981
p0145 A82-10806
Measured performance of falling-jet flash evaporators
[DE81-024355] p0161 N82-10565
High-temperature counter-flow recuperator
[DE81-031923] p0017 N82-12424
External fuel vaporization study
[NASA-CR-165513] p0114 N82-14371
US ceramic heat exchanger technology: Status and opportunities
[DE81-029686] p0030 N82-15210
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] p0030 N82-15367
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] p0144 N82-15527
Overview and FY 1981 progress on open-cycle OTEC power systems
[DE81-029277] p0144 N82-15580
HEAT FLUX
H-Coal product physical properties measurement
[DE81-029095] p0111 N82-13245
HEAT MEASUREMENT
Enthalpy measurement of coal-derived liquids
[DE81-029481] p0097 N82-10939
HEAT OF COMBUSTION
Characteristics of CVD silicon carbide thermionic converters
p0124 A82-11821
Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] p0020 N82-12658
HEAT OF FUSION
Thermal storage in salt-hydrates
p0153 A82-10018
Thermodynamic basis for selecting heat storage materials
p0153 A82-10019
HEAT OF VAPORIZATION
A novel latent heat storage for solar space heating systems - Refrigerant storage
p0043 A82-11386
HEAT PIPES
Development of space reactor core heat pipes
p0122 A82-11747
Heat pipes for NEP spacecraft radiators
p0122 A82-11748
Effect of wick dryness on the performance of heat pipes with separate channels
p0005 A82-16272
High thermal power density heat transfer --- thermionic converters
[NASA-CASE-LEW-12950-1] p0139 N82-11399
Application of a gravity-driven wickless heat pipe for ice production in a cold energy storage system
p0159 N82-13377
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-138] p0150 N82-15134

Development of a prototype of a 10 kW small solar power plant --- technology for developing nations
[BMFT-FB-T-81-101] p0080 N82-15532

HEAT PUMPS

A novel latent heat storage for solar space heating systems - Refrigerant storage
p0043 A82-11386

Programmer's manual for the DOEHPE (DOE Heat Pump Efficiency) program
[DE81-769452] p0007 N82-10551

Annual cycle energy system
[DE81-024911] p0007 N82-10552

Preliminary investigation on a primary energy saving heat supply system for the residential district "Maria Lindenhof" in Dorsten, West Germany --- using river water as a heat source and systems engineering
[BMFT-FB-T-80-157] p0008 N82-10572

Cycle and performance analysis of absorption heat pumps for waste heat utilization
[DE81-030705] p0103 N82-11405

Parametric sensitivity study for solar-assisted heat-pump systems
[DE81-030309] p0067 N82-11407

DOE solar-assisted heat-pump program: Its evolution and its potential
[DE81-026055] p0067 N82-11413

Chemical heat pump program: An overview
[DE81-025086] p0012 N82-11414

Investigation of direct expansion in ground source heat pumps
[DE81-024139] p0012 N82-11418

Well-water-source heat pump field performance study
[DE81-024136] p0012 N82-11419

Brayton/Rankine 10-ton gas-fired space conditioning system, phase 2
[PB81-223372] p0139 N82-11478

Solar heat pump simulator
[DE81-024368] p0070 N82-11583

Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] p0017 N82-12403

Air circuit with heating pump
[BMFT-FB-T-80-188] p0017 N82-12404

Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] p0074 N82-12625

Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] p0020 N82-12641

The properties of solar and heat pump heating systems of small houses and additional heat sources
[VTT-56] p0075 N82-12644

Electric and hybrid vehicles environmental control subsystem study
[NASA-CR-164995] p0020 N82-12657

Energy consumption analysis and comparative study of the operational results from heat pump plants
[BMFT-FB-T-80-109] p0032 N82-15583

HEAT RESISTANT ALLOYS

The corrosion of some superalloys in contact with coal chars in coal gasifier atmospheres
p0091 A82-17974

Materials technology for coal-conversion processes
[DE81-028474] p0100 N82-11169

HEAT SHIELDING

Novel design of pressure vessels and thermal shields in coal gasifiers
[DE81-025028] p0104 N82-11474

HEAT SOURCES

Engineering development testing of the GPHS-RTG converter --- General Purpose Heat Source-Radioisotope Thermoelectric Generator for Galileo orbiter power supply
p0122 A82-11752

Modular isotopic thermoelectric generator
p0122 A82-11753

Development of man-made geothermal reservoirs --- extracting heat from hot dry rock
[LA-UR-81-852] p0097 N82-10480

Preliminary investigation on a primary energy saving heat supply system for the residential district "Maria Lindenhof" in Dorsten, West Germany --- using river water as a heat source and systems engineering
[BMFT-FB-T-80-157] p0008 N82-10572

Investigation of direct expansion in ground source heat pumps
[DE81-024139] p0012 N82-11418

Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] p0018 N82-12507

Space nuclear safety and fuels program
p0111 N82-12921

Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] p0160 N82-15558

HEAT STORAGE

Corrosion science and its application to solar thermal energy material problems
p0038 A82-10017

Thermal storage in salt-hydrates
p0153 A82-10018

Thermodynamic basis for selecting heat storage materials
p0153 A82-10019

The application of reversible chemical reactions to solar thermal energy systems
p0038 A82-10020

A novel latent heat storage for solar space heating systems - Refrigerant storage
p0043 A82-11386

A spacecraft thermophotovoltaic power source with thermal storage
p0044 A82-11711

Molten salt thermal energy storage subsystem for Solar Thermal Central Receiver plants
p0047 A82-11780

Ground-mounted thermal storage for the parabolic dish solar collector/Stirling engine system
p0047 A82-11781

Aquifer thermal energy storage - A feasibility study for large scale demonstration
p0154 A82-11886

Buffer thermal energy storage for a solar Brayton engine
[AIAA PAPER 81-2531] p0053 A82-14002

A solar heating system with annual storage
p0056 A82-15666

Performance of a cylindrical phase change thermal energy storage unit
[AIAA PAPER 82-0076] p0155 A82-17770

Theoretical and numerical resolution of a mathematical model of the release of solar energy from storage
p0061 A82-18232

Solar project description for living systems single family residence, Davis, California
[DE81-029743] p0064 N82-10511

Review of simulation techniques for Aquifer Thermal Energy Storage (ATES)
[DE81-029943] p0156 N82-10532

State of the art in passive solar heating
[LA-UR-81-2185] p0065 N82-10537

Los Alamos National Laboratory Passive Solar Program
[DE81-028778] p0065 N82-10538

Controls for solar heating and cooling
[DE81-025209] p0070 N82-11593

Heat storage duration
[DE81-026635] p0070 N82-11602

Guidebook for solar process-heat applications
[DE81-027977] p0072 N82-12598

Solar project at Almeria nears completion
p0075 N82-12647

Electric and hybrid vehicles environmental control subsystem study
[NASA-CR-164995] p0020 N82-12657

Solar thermal energy systems
[DE81-029295] p0077 N82-13531

Waste heat and chill storage in aquifer systems
[DE81-028016] p0159 N82-14652

Systems analysis of thermal storage
[DE81-030288] p0079 N82-14658

Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] p0160 N82-15558

Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] p0081 N82-15571

SERI Solar-Energy-Storage Program
[DE81-029476] p0082 N82-15576

Transwall: A modular visually transmitting thermal storage wall
[DE81-029021] p0160 N82-15579

Development of a modular heat exchanger with integrated latent heat energy store --- for solar heating applications
[BMFT-FB-T-81-050] p0160 N82-15584

HEAT TRANSFER
Experimental investigation of parabolic-cylinder solar concentration with tubular heat receiver
p0040 A82-10389
Heat Transfer - Milwaukee 1981; Proceedings of the Twentieth National Heat Transfer Conference, Milwaukee, WI, August 2-5, 1981
p0145 A82-10806
Boiling flow instability of a fixed mirror distributed focus solar receiver
p0041 A82-10810
Natural convection in air layers at various aspect ratios and angles of inclination
p0058 A82-16249
Optimization of heat losses in normal and reverse flat-plate collector configurations - Analysis and performance
p0059 A82-16744
Water-related constraints to the development of geothermal electric generating stations
[DE81-025138] p0007 N82-10561
Measured performance of falling-jet flash evaporators
[DE81-024355] p0161 N82-10565
Fluid-bed heat-exchanger optimization and bed materials selection
[DOE/ET-11343/T2] p0104 N82-11571
Jet impingement heat transfer enhancement for the GPU-3 Stirling engine
[NASA-TM-82727] p0140 N82-11993
Assessment of pulverized-coal-fired combustor performance
[DE81-030860] p0105 N82-12187
External fuel vaporization study
[NASA-CR-165513] p0114 N82-14371
Progress report to the Department of Energy in support of basic energy and policy research
[DE81-025882] p0028 N82-14648
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] p0160 N82-15558

HEAT TRANSFER COEFFICIENTS
The effect of inclination on the heat loss from flat-plate solar collectors
p0043 A82-11212
Calculation of the top loss coefficient by the network method and applications to solar collectors
p0056 A82-15653
Study of ATES thermal behavior using a steady flow model
[DE81-030883] p0159 N82-12396

HEAT TRANSMISSION
Reduced heat flow - Mean heat flow relationship for the continental geothermal provinces
p0089 A82-10372
Heat flow studies and geothermal exploration in western Trans-Pecos Texas
p0110 N82-12684

HEAT TREATMENT
Effects of heat treatment on epitaxial silicon solar cells on metallurgical silicon substrates
p0058 A82-16469
Hydrodesulfurization of chlorinated coal
[NASA-CASE-NPO-15304-1] p0107 N82-12240

HEATERS
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] p0144 N82-15527

HEATING
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] p0019 N82-12593

HEATING EQUIPMENT
Industrial applications of MHD high temperature air heater technology
[AIAA PAPER 81-2588] p0130 A82-14037
Experimental study of fuel heating at low temperatures in a wing tank model, volume 1
[NASA-CR-165391] p0100 N82-11224
Energy analysis sample building data
[DE81-027188] p0011 N82-11318
The properties of solar and heat pump heating systems of small houses and additional heat sources
[VTT-56] p0075 N82-12644
Workshop proceedings: U-bend tube cracking in steam generators
[DE81-903765] p0142 N82-13515
Passive/hybrid solar components: An approach to standard thermal test methods
[PB81-227886] p0077 N82-13549
Coal-oil mixtures: An alternative fuel for the commercial markets and large residential markets
[DE81-028335] p0114 N82-14379
Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] p0117 N82-15221
Moorhead district heating, phase 2
[DE81-029689] p0031 N82-15556

HEAVY LIFT LAUNCH VEHICLES
Satellite power system: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238-VOL-7] p0078 N82-14635

HELIOSTATS
A central tower solar test facility /RH/CTSTF/
p0048 A82-11797
System of tolerances for a solar-tower power station
p0053 A82-13717
The universal plane method for calculating the dimensions of heliostats
p0062 A82-18697
Economic analysis of the unified heliostat array
[DE81-026698] p0064 N82-10516
Conceptual design of a glass-reinforced concrete solar collector
[DE81-029280] p0065 N82-10542
Second generation heliostat, volume 1
[DE81-029618] p0069 N82-11564
The Rogers focusing heliostat experimental program at Rensselaer Polytechnic Institute
[PB81-226813] p0071 N82-11625
User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input
[DE81-031920] p0073 N82-12616
Department of Energy Solar Central Receiver Semiannual Meeting
[SAND-80-8049] p0074 N82-12632
Solar thermal energy systems
[DE81-029295] p0077 N82-13531
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] p0080 N82-15530

HEMATITE
The use of semiconducting oxide ceramics in solar energy conversion
p0059 A82-17099
Catalytic effect of iron in hydrogasification of coal
[DE81-023928] p0113 N82-14323

HETEROJUNCTION DEVICES
Heterojunctions for thin film solar cells
p0039 A82-10024
Laser bonded n-GaAs/p-GaSb heterojunction intercell Ohmic contact
p0041 A82-10776
ZnO - p-InP heterojunction solar cells
p0051 A82-12821
Gallium-arsenic-antimony heterojunction photocells
p0055 A82-14667
Effects of low temperature periodic annealing on the deep-level defects in 200 keV proton irradiated AlGaAs-GaAs solar cells
p0061 A82-18287

HETEROJUNCTIONS
Zn3P2 as an improved semiconductor for photovoltaic solar cells
[DE81-025587] p0069 N82-11577

HIGH ALTITUDE BALLOONS
The transformation of wind energy by a high altitude power plant /HAPP/
[AIAA PAPER 81-2568] p0128 A82-14025

HIGH ENERGY FUELS
Exploratory study of coal-conversion chemistry
[DE81-016136] p0119 N82-15552

HIGH PRESSURE
Liquid natural gas rapid phase transitions
[PB81-244774] p0118 N82-15232
HIGH TEMPERATURE
High-temperature solar central receivers
p0052 A82-12949
Material property data and their use in design and analysis for an elevated temperature solar code
p0055 A82-14847
Colloidally deposited high-temperature solar selective surfaces
p0055 A82-15439
Enthalpy measurement of coal-derived liquids
[DE81-029481] p0097 N82-10939
One-dimensional equilibrium-chemistry flow model for coal combustors
[DE81-027622] p0099 N82-11158
High thermal power density heat transfer --- thermionic converters
[NASA-CASE-LEW-12950-1] p0139 N82-11399
Design, cost and performance comparisons of several solar thermal systems for process heat. Volume 1: Executive summary
[DE81-029881] p0069 N82-11576
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] p0119 N82-15604
HIGH TEMPERATURE ENVIRONMENTS
Metallurgical analysis and high temperature degradation of the black chrome solar selective absorber
p0060 A82-17252
Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry
[DE81-027965] p0023 N82-13192
Hot dry rock geothermal prospects, 1981
[DE81-025305] p0119 N82-15559
HIGH TEMPERATURE GAS COOLED REACTORS
Application of HTGR process heat to oil shale retorting
p0090 A82-11851
HIGH TEMPERATURE GASES
High temperature cogeneration with thermionic burners
p0124 A82-11817
Towards a high-temperature solar electric converter
p0056 A82-15903
Workshop proceedings: Combustion Turbine Residual Oil
[EPRI-WS-80-132] p0103 N82-11261
Selected studies of four high-temperature air-pollution sources
p0015 N82-11680
HIGHWAYS
Construction of a recycled Portland cement concrete pavement --- Connecticut expressway
[PB81-233553] p0023 N82-13267
HISTORIES
Analysis of data from the US Department of Energy's meteorological validation program
[DE81-030100] p0097 N82-10655
The history of the development of the rectenna
p0149 N82-12560
HOLE DISTRIBUTION (MECHANICS)
Mathematical modelling of some chemical and physical processes in underground coal gasification
[DE81-027941] p0116 N82-14613
HOMOJUNCTIONS
Thin-film gallium arsenide homojunction solar cells
p0052 A82-13200
HONEYCOMB STRUCTURES
Development of a high-temperature durable catalyst for use in catalytic combustors for advanced automotive gas turbine engines
[NASA-CR-165396] p0142 N82-13510
HORIZONTAL ORIENTATION
Yawing of wind turbines with blade cyclic pitch variation
[DE81-030091] p0138 N82-11045
HOT CORROSION
Corrosion science and its application to solar thermal energy material problems
p0038 A82-10017
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 2: Hot component corrosion evaluation
[DE81-903760] p0094 N82-10253
HOT-WIRE FLOWMETERS
Measurement of thermal conductivities in coal fluids
[DE82-000523] p0109 N82-12403
HUMAN REACTIONS
Establishment of noise acceptance criteria for wind turbines
p0125 A82-11825
HYDRATES
Thermal storage in salt-hydrates
p0153 A82-10010
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] p0160 N82-15558
HYDRAULIC EQUIPMENT
Wind driven fluid devices for water heating
p0134 A82-17639
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 1: Executive summary
[DE81-029440] p0155 N82-10527
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 2: Project design criteria: UPH
[DE81-028107] p0156 N82-10528
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 9: Design approaches, CAES. Appendix D: Mechanical systems
[DE81-028200] p0156 N82-10530
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 12: Plant design, CAES
[DE81-028110] p0157 N82-10574
HYDROBROMIC ACID
Halogen acid electrolysis in solid polymer electrolyte cells
p0084 A82-16346
HYDROCARBON COMBUSTION
Dimethyl sulfate in particulate matter from coal- and oil-fired power plants
p0005 A82-16199
High pressure MHD coal combustors investigation, phase 2
[DE81-027238] p0138 N82-10888
Control of hydrocarbons and carbon monoxide via catalytic incineration
[DE82-000508] p0025 N82-13560
HYDROCARBON FUEL PRODUCTION
Jet fuel from carbon
p0090 A82-12021
Application of solar power satellites to India's energy needs - A macroengineering solution to a macroproblem
p0062 A82-18645
Molten-salt coal-gasification process development unit, phase 2
[DE81-023585] p0094 N82-10251
Jet fuel looks to shale oil: The 1980 technology review
[AD-A104414] p0100 N82-11228
Solar coal-gasification reactor for hydrocarbon-free synthesis gas
[DE81-026600] p0067 N82-11247
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] p0108 N82-12255
HYDROCARBON FUELS
Alcohol fuels bibliography, 1901 - March 1980
[DE81-025482] p0095 N82-10263
Catalyst and reactor development for a liquid-phase fischer-tropsch process
[DE81-028209] p0099 N82-11169
Transportation fuels from synthetic gas
[DE81-029614] p0102 N82-11258
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] p0018 N82-12587
HYDROCARBONS
Evaporative hydrocarbon emissions from a large vehicle population
p0004 A82-10442
Kinetics of NO/ sub x formation during early stages of pulverized-coal combustion
[DE81-029071] p0014 N82-11641
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] p0106 N82-12196

Identification and toxicity of fractionated-shale-oil components
[DE81-028460] p0021 N82-12766
Pyrolytic characterization of the organic matter in selected coals and in the Devonian shales of southern West Virginia
p0113 N82-13578

HYDROCHLORIC ACID
Halogen acid electrolysis in solid polymer electrolyte cells
p0084 A82-16346

HYDROCHLORIDES
Flat-plate solar array project. Task 1: Silicon material: Investigation of the hydrochlorination of SiCl$_4$
[NASA-CR-165042] p0078 N82-14631

HYDROCRACKING
Pricetown 1 underground coal gasification field test: Operations report
[DE81-025162] p0095 N82-10268
Vapor-phase cracking and wet oxidation as potential pollutant control techniques for coal gasification
[PB81-219594] p0015 N82-11661
Catalytic hydrogenation of coal-derived liquids
[DE81-030485] p0106 N82-12198

HYDRODYNAMICS
Innovative equipment for small-scale hydro developments
[DE81-027820] p0141 N82-12634

HYDROELECTRIC POWER STATIONS
Design considerations for a 1500 M head 300-600 MW double stage reversible pump/turbine with regulation
p0154 A82-11782
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 1: Executive summary
[DE81-029440] p0155 N82-10527
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 2: Project design criteria: UPH
[DE81-028107] p0156 N82-10528
Water-related constraints to the development of geothermal electric generating stations
[DE81-025138] p0007 N82-10561
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 12: Plant design, CAES
[DE81-028110] p0157 N82-10574
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 8: Design approaches: UPH
[DE81-030673] p0158 N82-11620
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 9: Design approaches: CAES, appendix C. Major mechanical equipment
[DE81-030672] p0158 N82-11621
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] p0019 N82-12635
DOE small-hydropower demonstration program
[DE81-027819] p0020 N82-12636
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] p0021 N82-12842
Micro-hydropower in the United States
[DE81-028271] p0031 N82-15567

HYDROELECTRICITY
Potential supply of synthetic fuels from Alaskan hydroelectric power and coal
[DE81-025743] p0114 N82-14381
Micro-hydropower in the United States
[DE81-028271] p0031 N82-15567

HYDROGEN
Liquefaction of bituminous coals using disposal ore catalysts and hydrogen
[DE81-029134] p0093 N82-10154
Hydrogen storage-bed design for tritium systems test assembly
[DE81-025336] p0086 N82-11262
Amorphous boron-silicon-hydrogen alloys for thin-film heterojunction solar cells
[DE81-027234] p0068 N82-11557
Catalytic effect of iron in hydrogasification of coal
[DE81-023928] p0113 N82-14323
Systems analysis of hydrogen/natural gas supplementation and separation
[DE81-021383] p0087 N82-15220
An assessment of nonfossil hydrogen
[PB81-206522] p0087 N82-15231

HYDROGEN COMPOUNDS
Impurity effects in a-Si:H solar cells
[DE81-025069] p0069 N82-11575

HYDROGEN ENGINES
A LH2 engine fuel system on board - Cold GH2 injection into two-stroke engine with LH2 pump
[ASME PAPER 81-HT-81] p0083 A82-10966
Liquid hydrogen for automotive vehicles - Experimental results
[ASME PAPER 81-HT-83] p0083 A82-10968
A study of factors influencing thermally induced backfiring in hydrogen fueled engines, and methods for backfire control
p0084 A82-11791

HYDROGEN FUELS
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] p0089 A82-10965
A LH2 engine fuel system on board - Cold GH2 injection into two-stroke engine with LH2 pump
[ASME PAPER 81-HT-81] p0083 A82-10966
Liquid hydrogen for automotive vehicles - Experimental results
[ASME PAPER 81-HT-83] p0083 A82-10968
Lightweight hydrides for automotive storage of hydrogen
p0084 A82-11790
Technological innovation for success - Liquid hydrogen propulsion
p0084 A82-16734
The significance of hydrogen as future secondary energy carrier
p0086 A82-17127
The storage of hydrogen
p0085 A82-17130
Aspects concerning the safety of hydrogen
p0085 A82-17132
Liquid hydrogen - An outstanding alternate fuel for transport aircraft
p0085 A82-17290
Technical and economic aspects of hydrogen storage in metal hydrides
[NASA-TM-76610] p0086 N82-11223
The storage of hydrogen in the form of metal hydrides: An application to thermal engines
[NASA-TM-76609] p0086 N82-11225
Hydrogen as carrier of secondary energy: Proposal for a research and development program
[DFVLR-MITT-81-10] p0087 N82-15542

HYDROGEN ISOTOPES
Investigation of mechanisms of hydrogen transfer in coal hydrogenation
[DE81-030492] p0099 N82-11165

HYDROGEN OXYGEN FUEL CELLS
The generation of current from hydrogen
p0085 A82-17131
Electrodes and diaphragms for fuel cells
[BMFT-FB-T-81-047] p0143 N82-14666

HYDROGEN PRODUCTION
Hydrogen generation by means of catalyzed Hg-Al hydrolysis
p0083 A82-10398
Improved efficiency in the sulfur dioxide - Iodine hydrogen cycle through the use of magnesium oxide
p0083 A82-11784
Parametric study of the cadmium thermoelectrochemical hydrogen cycle
p0083 A82-11785
Alkaline solution water electrolysis - '81
p0083 A82-11786
Development status of the General Electric solid polymer electrolyte water electrolysis technology --- hydrogen production
p0083 A82-11787
Solar hydrogen system design considerations
p0084 A82-11788
Small-scale uses and costs of hydrogen derived from OTEC ammonia
p0084 A82-11792
The GA sulfur-iodine water-splitting process - A status report
p0084 A82-11844
Solar chemistry of metal complexes --- hydrogen production
p0058 A82-16124

Halogen acid electrolysis in solid polymer electrolyte cells
p0084 A82-16346
Hydrogen from solar energy
p0085 A82-17129
Thermochemical processes for hydrogen production by water splitting - From theory to practice
p0086 A82-18392
Assessment of potential future markets for the production of hydrogen from water
[BMFT-FB-T-81-012] p0086 N82-12266
Potential supply of synthetic fuels from Alaskan hydroelectric power and coal
[DE81-025743] p0114 N82-14381
Development of a metal hydride process for hydrogen recovery from supplemented natural gas
[DE81-022685] p0086 N82-14382
Hydrogen as carrier of secondary energy: Proposal for a research and development program
[DFVLR-MITT-81-10] p0087 N82-15542

HYDROGEN-BASED ENERGY
Mechanically stable hydride composites designed for rapid cycling
p0084 A82-16347
Metal hydrides 1980; Proceedings of the International Symposium on the Properties and Applications of Metal Hydrides, Colorado Springs, CO, April 7-11, 1980. Volumes 1 & 2
p0085 A82-16784
The significance of hydrogen as future secondary energy carrier
p0146 A82-17127
The generation of current from hydrogen
p0085 A82-17131
Rechargeable metallic hydrides for hydrogen storage
p0085 A82-17150
Thermochemical processes for hydrogen production by water splitting - From theory to practice
p0086 A82-18392
Fusion as a source of synthetic fuels
[BNL-29281] p0086 N82-11257
Assessment of potential future markets for the production of hydrogen from water
[BMFT-FB-T-81-012] p0086 N82-12266

HYDROGENATION
Jet fuel from carbon
p0090 A82-12021
H-coal process improvement study. Bench unit baseline run with preheater/reactor
[DE81-026022] p0094 N82-10260
Investigation of mechanisms of hydrogen transfer in coal hydrogenation
[DE81-030492] p0099 N82-11165
Coal hydrogenation via bonding of metallic compounds to coal, part 1. Solubilization of Illinois bituminous coal - the critical importance of methylene group cleavage, part 2
[DE81-027562] p0100 N82-11236
Chemistry and catalysis of coal liquefaction: Catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels
[DOE/ET-14700/1] p0102 N82-11259
Chemistry and catalysis of coal liquefaction: Catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels
[DOE/ET-14700/2] p0102 N82-11260
Catalytic hydrogenation of coal-derived liquids
[DE81-030485] p0106 N82-12198
Hydrodesulfurization of chlorinated coal
[NASA-CASE-NPO-15304-1] p0107 N82-12240
Process development for improved SRC options. Kerr-McGee critical solvent deashing and fractionation studies
[DE81-903785] p0114 N82-14380
Use of oxide decompositions in advanced thermochemical hydrogen cycles for solar heat sources. Application of the tricobalt tetraoxide-cobalt monoxide pair
[DE81-030235] p0082 N82-15581

HYDROGEOLOGY
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] p0109 N82-12517
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] p0109 N82-12518

HYDROLOGY
Fracture flow of groundwater in coal-bearing strata
[DE81-023810] p0096 N82-10479
Assessment of water supply contamination due to underground coal gasification
[PB81-209215] p0021 N82-12680

HYDROLYSIS
Hydrogen generation by means of catalyzed Ag-Al hydrolysis
p0083 A82-10398
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production
p0107 N82-12236

HYDROPYROLYSIS
Pricetown 1 underground coal gasification field test: Operations report
[DE81-025162] p0095 N82-10268

HYSTERESIS
Evaluation of wind turbine generator operational hysteresis using 'Method of Bins'
p0133 A82-17636
First results from the UMass wind tunnel test program --- for windpowered generator optimization
p0134 A82-17643

I

ICE FORMATION
Application of a gravity-driven wickless heat pipe for ice production in a cold energy storage system
p0159 N82-13377

ICE NUCLEI
Environmental effects of pollutants from coal combustion. 2: The Colstrip, Montana Power Plant
[PB81-234114] p0026 N82-13573

IDENTIFYING
Oil spill identification by chemical analysis
p0115 N82-14583

IGNITION
Uncertainties associated with inertial-fusion ignition
[DE81-025408] p0139 N82-11944
Survey of proposed methods of burning alcohol in diesel engines
[DE81-025834] p0030 N82-15219

IGNITION LIMITS
A study of factors influencing thermally induced backfiring in hydrogen fueled engines, and methods for backfire control
p0084 A82-11791
Aspects concerning the safety of hydrogen
p0085 A82-17132

ILLINOIS
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

ILLUMINATING
Performance predictions of passive solar commercial buildings
[DE81-027979] p0079 N82-15247

IMPACT FUSION
Possible application of electromagnetic guns to impact fusion
p0135 A82-18201

IMPACT TESTS
Space nuclear safety and fuels program
p0111 N82-12921

IMPLOSIONS
Uncertainties associated with inertial-fusion ignition
[DE81-025408] p0139 N82-11944

IMPREGNATING
SOL-CYCLE: A solar-assisted solvent-recycling process for asphalt-impregnation of fiber board
[DE81-903377] p0070 N82-11615

IMPURITIES
Study of the electric conductivity of plasma from fuel combustion products containing a weakly ionizing impurity
p0091 A82-12800
The effects of impurities on the performance of silicon solar cells
[NASA-CR-164945] p0067 N82-11580

IN-FLIGHT MONITORING
Energy savings with today's technology --- aircraft fuel management through in-flight monitoring
p0005 A82-17282

INCENTIVES
Building a consensus about energy technologies
[DE82-000501] p0024 N82-13536

INCINERATORS
Control of hydrocarbons and carbon monoxide via catalytic incineration
[DE82-000508] p0025 N82-13560

INDEPENDENT VARIABLES
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] p0144 N82-15454

INDIA
A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant
p0020 N82-12650

Indian energy abstracts
[PB81-232316] p0032 N82-15591

INDIANA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

INDIUM
Low frequency capacitance characterizations on indium/x-phase of metal free phthalocyanine solar cells
p0053 A82-13806

INDIUM COMPOUNDS
Series resistance effects in 20 sq cm indium tin oxide-polycrystalline silicon solar cells
p0051 A82-12819

INDIUM PHOSPHIDES
ZnO - p-InP heterojunction solar cells
p0051 A82-12821

n-/indium tin oxide//p-InP solar cells
p0058 A82-16471

Thin film photovoltaic devices
p0063 N82-10491

INDUSTRIAL ENERGY
Methods and problems of industrial-scale electric power generation from solar energy
p0050 A82-12506

Solar thermal cost goals - Implementing a methodology for assessing break-even value and market potential
[AIAA PAPER 81-2550] p0054 A82-14013

Industrial applications of MHD high temperature air heater technology
[AIAA PAPER 81-2588] p0130 A82-14037

Energy and ceramics --- Book
p0005 A82-17076

Wind driven fluid devices for water heating
p0134 A82-17639

Energy end-use requirements in manufacturing, volume 1
[DE81-028975] p0064 N82-10512

Alternative fuel for the steel industry of Northern Indiana: A prefeasibility study of a central coal gasification project
[DE81-029314] p0010 N82-11233

Feasibility and economic study of medium-BTU coal gas blended with high-BTU by product gas as an industrial energy source at Billings, Montana
[DE81-025166] p0101 N82-11237

Conceptual design for a multi-user medium BTU coal gasification complex. Volume 1: Executive summary
[DE81-027139] p0101 N82-11238

Workshop proceedings: Combustion Turbine Residual Oil
[EPRI-WS-80-132] p0103 N82-11261

Cycle and performance analysis of absorption heat pumps for waste heat utilization
[DE81-030705] p0103 N82-11405

Study of photovoltaic cost elements. Volume 5: Installation cost model for intermediate PV systems: Users manual
[DE81-030981] p0069 N82-11569

Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] p0107 N82-12254

Energy conservation in distillation
[DE81-028650] p0018 N82-12581

NASEC industrial fuel-wood program
[DE82-000461] p0110 N82-12595

Low/medium Btu coal gasification assessment program for potential users in New Jersey: Executive summary
[DE81-025475] p0111 N82-13247

Industrial process heat applications for solar thermal technologies
[DE81-025934] p0081 N82-15545

INDUSTRIAL PLANTS
Coal fly ash: A review of the literature and proposed classification system with emphasis on environmental impacts
[PB81-215014] p0009 N82-10608

Development of a small-scale commercial alcohol dehydration 190 to 200 proof
[DE81-030158] p0100 N82-11235

Residual-energy-applications program environmental analysis report --- industrial scale waste heat recovery equipment and utilization
[DE81-027538] p0024 N82-13525

Feasibility study for an alcohol-fuels plant for Buffalo, New York
[DE82-000032] p0114 N82-14377

Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] p0030 N82-15367

Energy consumption analysis and comparative study of the operational results from heat pump plants
[BMFT-FB-T-80-109] p0032 N82-15583

INDUSTRIAL SAFETY
Safety and technical optimization of belt transfer points with special consideration for the suppression of noxious and explosive dusts --- in coal plants
[BMFT-FB-HA-80-048] p0096 N82-10279

Low-Btu-gasifier emissions toxicology
[DE81-031000] p0014 N82-11651

INDUSTRIAL WASTES
Fingerprinting pollutant discharges from synfuels plants
p0001 A82-10697

Enhancement of methane gas production using an industrial waste in anaerobic digestion --- effects of chrome shavings from leather tanning
[DE81-023819] p0095 N82-10267

Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] p0019 N82-12621

Waste heat and chill storage in aquifer systems
[DE81-028016] p0159 N82-14652

Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] p0035 N82-15652

INDUSTRIES
Standards application and development plan for solar thermal technologies
[DE81-030310] p0065 N82-10534

INERTIA
On the efficiency of thermal engines with power output - Harmonically driven engines
p0131 A82-14489

INERTIAL CONFINEMENT FUSION
Possible application of electromagnetic guns to impact fusion
p0135 A82-18201

Technology of controlled nuclear fusion
[DE81-027361] p0144 N82-15893

INERTIAL FUSION (REACTOR)
Uncertainties associated with inertial-fusion ignition
[DE81-025408] p0139 N82-11944

INFLATABLE STRUCTURES
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] p0081 N82-15551

INFORMATION DISSEMINATION
Millions wasted trying to develop major energy information system
[APMD-81-40] p0029 N82-14959

Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] p0118 N82-15508

INFORMATION MANAGEMENT
Information resources in the USA on new and renewable energy, a description and directory
[DE81-028867] p0024 N82-13522
INFORMATION SYSTEMS
Solar Energy Information Data Bank (SEIDB) program, FY 1981
[DE81-030054] p0073 N82-12612
INFRARED DETECTORS
Electrical properties of infrared photovoltaic Cd/x/Hg/1-x/Te detectors
p0136 A82-18466
INFRARED RADIATION
Infrared quenching of photocapacitance in Cu/x/S/CdS solar cells
p0042 A82-11187
INJECTION MOLDING
Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] p0144 N82-15561
INJECTORS
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523
INORGANIC SULFIDES
Insoluble sulfide positive electrodes for organic electrolyte lithium secondary batteries
p0155 A82-15727
Nickel sulphide-lead sulphide and nickel sulphide-cadmium sulphide selective coatings for solar thermal conversion
p0059 A82-16745
INSOLATION
Modeling and testing a salt gradient solar pond in northeast Ohio
p0043 A82-11210
A simplified method for direct calculation of the annual load fraction of solar systems for space heating
p0054 A82-14405
Los Alamos National Laboratory Passive Solar Program
[DE81-028778] p0065 N82-10538
Mississippi County Community College solar photovoltaic project
[DE81-030669] p0068 N82-11554
Environmental data for sites in the National Solar Data Network
[DE82-000071] p0075 N82-12707
INSTALLING
Study of photovoltaic cost elements. Volume 1: Executive report. Volume 2: Project background
[DE81-030982] p0069 N82-11566
Study of photovoltaic cost elements. Volume 3: Sandia National Laboratories photovoltaic systems design catalog
[DE81-030906] p0069 N82-11567
Study of photovoltaic cost elements. Volume 4: Installation cost model for residential PV systems: Users manual
[DE81-031921] p0069 N82-11568
Study of photovoltaic cost elements. Volume 5: Installation cost model for intermediate PV systems: Users manual
[DE81-030981] p0069 N82-11569
INSULATION
Comparison of residential window distributions and effects of mass and insulation
[DE81-027938] p0017 N82-12283
INSULATORS
Composite film selective-absorbers --- for solar radiation collection
p0038 A82-10016
Key contributions in MHD power generation
[DE81-028121] p0138 N82-10882
Aging and corrosion problems with flat solar energy absorbers. Study based upon literature and experiment exchanges
[SP-RAPP-1979/4] p0077 N82-13548
INTEGRATED CIRCUITS
The contoured-oxide monolithic series-array solar battery
p0042 A82-11190
Multijunction high voltage concentrator solar cells
p0047 A82-11796
INTEGRATED ENERGY SYSTEMS
An evaluation of alternate system configurations for solar repowering electric power plants
p0048 A82-11803
Los Alamos National Laboratory Passive Solar Program
[DE81-028778] p0065 N82-10538
Distributed photovoltaic systems: Utility interface issues and their present status
[NASA-CR-165019] p0076 N82-13492
INTELSAT SATELLITES
The nickel-hydrogen battery system - An historical overview
p0153 A82-11735
INTERFACE STABILITY
Surface and interface studies and the stability of solid solar energy materials
p0037 A82-10010
INTERFACIAL ENERGY
Solar Photovoltaic Residential Project. Project Integration Meeting, Agenda and Abstracts
[DE81-028433] p0079 N82-14457
INTERFACIAL TENSION
Tertiary oil recovery processes research at the University of Texas
[DE81-025222] p0096 N82-10477
INTERMETALLICS
Mechanically stable hydride composites designed for rapid cycling
p0084 A82-16347
INTERNAL COMBUSTION ENGINES
A computer model of a stirling engine using a two-phase two-component working fluid
p0137 N82-10492
Assessment of I.C. engines as drivers for heat actuated heat pumps
[DE81-024086] p0139 N82-11421
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] p0020 N82-12641
Barriers to the utilization of synthetic fuels for transportation
[NASA-CR-165517] p0023 N82-13243
Development of a high-temperature durable catalyst for use in catalytic combustors for advanced automotive gas turbine engines
[NASA-CR-165396] p0142 N82-13510
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] p0030 N82-15453
INTERNATIONAL TRADE
US energy strategies: Some options for eliminating oil imports by the year 2000
[PB81-226052] p0014 N82-11626
INVESTIGATION
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] p0111 N82-12731
INVESTMENTS
Analysis of electric utility investments into wind power
[AIAA PAPER 81-2537] p0003 A82-14006
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] p0021 N82-12642
IODINE
Improved efficiency in the sulfur dioxide - Iodine hydrogen cycle through the use of magnesium oxide
p0083 A82-11704
The GA sulfur-iodine water-splitting process - A status report
p0084 A82-11844
IODINE LASERS
A solar simulator-pumped gas laser for the direct conversion of solar energy
p0044 A82-11710
Advanced solar energy conversion --- solar pumped gas lasers
[NASA-CR-165060] p0079 N82-15526
ION EXCHANGING
Ion exchange characteristics of enhanced oil recovery systems (miscibility studies)
[DE81-769734] p0096 N82-10478
IONIC WAVES
Ionization waves in an argon discharge in a longitudinal gas flow
p0127 A82-12666

IONIZATION
The plasmadynamics and ionization kinetics of thermionic energy conversion
p0137 N82-10494
IONOSPHERE
Ionospheric power beam studies
p0147 N82-12542
IONOSPHERIC DISTURBANCES
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal
p0147 N82-12543
Ionospheric effects in active retrodirective array and mitigating system design
p0147 N82-12551
IONOSPHERIC HEATING
Space chamber experiments of ohmic heating by high power microwave from the Solar Power Satellite
p0145 A82-16991
IOWA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604
IRON
Catalytic effect of iron in hydrogasification of coal
[DE81-023928] p0113 N82-14323
IRON COMPOUNDS
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] p0106 N82-12199
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030857] p0108 N82-12259
IRON-CHROMIUM REDOX BATTERIES
NASA preprototype redox storage system for a photovoltaic stand-alone application
p0153 A82-11774
IRRADIANCE
Automated Fresnel lens tester system
[DE81-029483] p0066 N82-10863
IRRIGATION
Irrigation market for solar thermal parabolic dish systems
[NASA-CR-164955] p0068 N82-11549
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] p0021 N82-12842
ISOMERIZATION
Development of superior denitrogenation and isomerization catalysts for processing crude oil derived from shale, part 1
[AD-A105667] p0113 N82-14317
ISOTOPE SEPARATION
Environmental readiness document. Advanced Isotope Separation Program
[DE81-029952] p0029 N82-14900
ISOTOPIC ENRICHMENT
Environmental readiness document. Advanced Isotope Separation Program
[DE81-029952] p0029 N82-14900

J

JET ENGINE FUELS
Fuel for future transport aircraft
[ASME PAPER 81-GT-80] p0089 A82-10965
Jet fuel from carbon
p0090 A82-12021
A protective additive for jet fuels
p0090 A82-12022
Development and application of analytical techniques to chemistry of donor solvent liquefaction
[DE81-025961] p0099 N82-11167
Experimental study of fuel heating at low temperatures in a wing tank model, volume 1
[NASA-CR-165391] p0100 N82-11224
Jet fuel looks to shale oil: The 1980 technology review
[AD-A104414] p0100 N82-11228
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] p0108 N82-12255
JET ENGINES
Dish stirling solar receiver combustor test program
[NASA-CR-165017] p0076 N82-13495
JET FLOW
Modelling of the jet-stream Fluidyne
p0124 A82-11812
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
JET IMPINGEMENT
Jet impingement heat transfer enhancement for the GPU-3 Stirling engine
[NASA-TM-82727] p0140 N82-11993

K

KANSAS
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604
KENTUCKY
Solvent-Refined Coal-1 Demonstration Project. Final environmental impact statement, Volume 1 of 2 --- coal liquefaction plant at Newman, Kentucky
[DE81-025983] p0010 N82-11252
Evaluation of Devonian shale potential in eastern Kentucky/Tennessee
[DE82-001164] p0116 N82-14595
KEROSENE
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] p0118 N82-15233
KINETIC ENERGY
The plasmadynamics and ionization kinetics of thermionic energy conversion
p0137 N82-10494
Performance evaluation of the solar kinetics T-700 line concentrating solar collector
[NASA-CR-161856] p0063 N82-10502
KINETICS
Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry
[DE81-027965] p0023 N82-13192
KLYSTRONS
Direct conversion of light to radio frequency energy --- using photoklystrons for solar power satellites
p0045 A82-11712
High efficiency SPS klystron design
p0148 N82-12552
Analytic investigation of efficiency and performance limits in klystron amplifiers using multidimensional computer programs; multi-stage depressed collectors; and thermionic cathode life studies
p0148 N82-12553

L

LAND USE
Siting and land-use considerations in wind energy development
[AIAA PAPER 81-2541] p0003 A82-14009
LANDFILLS
Evaluation of landfill gas as an energy source --- feasibility of methane recovery from landfills
[DE82-000116] p0110 N82-12584
LARGE SPACE STRUCTURES
Contributions of space reflector technology to food production, local weather manipulation and energy supply, 1985-2020
p0054 A82-14445
LASER APPLICATIONS
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] p0106 N82-12196
Comparative analyses of space-to-space central power stations
[NASA-TP-1955] p0150 N82-14202
LASER MATERIALS
Luminescent solar concentrators. II - Experimental and theoretical analysis of their possible efficiencies
p0052 A82-13285

LASER PUMPING
Advanced solar energy conversion --- solar pumped gas lasers
[NASA-CR-165060] p0079 N82-15526
LAW (JURISPRUDENCE)
Energy end-use requirements in manufacturing, volume 3
[DE81-027976] p0007 N82-10544
Methodology for determining the impact of environmental regulatory programs
[DE81-903429] p0009 N82-10594
Relaxing environmental standards during oil-supply disruptions: Past, present and future
[DE81-024250] p0009 N82-10601
Natural gas plan needed to provide greater protection for high-priority and critical uses
[PB81-228488] p0023 N82-13255
LAWS
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] p0073 N82-12609
LEACHING
Assessment of water supply contamination due to underground coal gasification
[PB81-209215] p0021 N82-12680
LEAD ACID BATTERIES
Effect of positive pulse charge waveforms on the energy efficiency of lead-acid traction cells
[NASA-TM-82709] p0155 N82-10503
Rapid charging of lead-acid batteries for electric-vehicle propulsion and solar-electric storage
[DE81-028084] p0157 N82-10548
Near-term batteries for electric vehicles
[DE81-023543] p0157 N82-10556
Recent advances in lead-acid cell research and development
[DE81-023104] p0158 N82-11580
LEAD SULFIDES
Solution grown PbS/CdS multilayer stacks as selective absorbers
p0041 A82-10472
Nickel sulphide-lead sulphide and nickel sulphide-cadmium sulphide selective coatings for solar thermal conversion
p0059 A82-16745
LENS DESIGN
Efficiency of Fresnel lenses
p0043 A82-11387
LIFE CYCLE COSTS
A hidden advantage of permanent magnet electrical generating systems
p0122 A82-11720
The effect of concentrator field layout on the HE-1 small community solar power system
p0048 A82-11799
LIFE SCIENCES
Health and safety research division
[DE81-026088] p0026 N82-13652
LIFT
A first order mathematical model of the lift/drag characteristics of aerofoil sections
p0130 A82-14357
An indoor blade test facility for determining the basic aerodynamic properties of Darrieus wind turbine airfoils with test results for an NACA 0015 and a modified section
p0136 N82-10005
LIGHT AIRCRAFT
Wing design for light transport aircraft with improved fuel economy
p0004 A82-14416
LIGHT TRANSMISSION
Efficiency of Fresnel lenses
p0043 A82-11387
LIGHT WATER REACTORS
Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] p0031 N82-15553
LIGHTING EQUIPMENT
Appliance efficiency and the solar building
[DE81-029073] p0075 N82-13265
LIGHTNING SUPPRESSION
Lightning protection for wind turbine electronics
[AIAA PAPER 81-2571] p0129 A82-14028
Lightning protection for composite rotor blades --- of windpowered turbines
p0133 A82-17631
LIGNITE
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[DE81-023581] p0092 N82-10144
Chemistry of lignite liquefaction
[DE81-030178] p0093 N82-10243
LIMESTONE
Stratigraphy and depositional history of the Iola Limestone Upper Pennsylvanian (Missourian), Northern Midcontinent U.S.
p0116 N82-14711
LINEAR PROGRAMMING
An optimization model for energy generation and distribution in a dynamic facility
p0011 N82-11310
Modelling energy-economic interactions in developing countries: A linear-programming approach
[DE81-026048] p0020 N82-12637
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] p0035 N82-16014
LIQUEFIED NATURAL GAS
Study of gelled LNG
[DE81-023259] p0095 N82-10269
Environmental impacts of energy transportation
[DE82-900316] p0025 N82-13559
Liquid natural gas rapid phase transitions
[PB81-244774] p0118 N82-15232
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-026689] p0032 N82-15602
LIQUID CHROMATOGRAPHY
Development and application of analytical techniques to chemistry of donor solvent liquefaction
[DE81-029125] p0099 N82-11166
LIQUID COOLING
Water-cooled gas turbine development program
[DE81-904245] p0136 N82-10406
LIQUID FLOW
Thermophysical properties of coal liquids
[DE81-0279446] p0097 N82-10938
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] p0109 N82-12514
LIQUID FUELS
U.S. Department of Energy liquid synfuels overview
p0090 A82-12531
Feasibility of solar assisted ethanol production
[AIAA PAPER 81-2533] p0054 A82-14804
Liquid hydrogen - An outstanding alternate fuel for transport aircraft
p0085 A82-17290
Application of solar power satellites to India's energy needs - A macroengineering solution to a macroproblem
p0062 A82-18645
Catalyst and reactor development for a liquid-phase fischer-tropsch process
[DE81-028209] p0099 N82-11169
LIQUID HYDROGEN
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] p0089 A82-10965
A LH2 engine fuel system on board - Cold GH2 injection into two-stroke engine with LH2 pump
[ASME PAPER 81-HT-81] p0083 A82-10966
Liquid hydrogen for automotive vehicles - Experimental results
[ASME PAPER 81-HT-83] p0083 A82-10968
Technological innovation for success - Liquid hydrogen propulsion
p0084 A82-16734
Liquid hydrogen - An outstanding alternate fuel for transport aircraft
p0085 A82-17290
Hydrogen as carrier of secondary energy: Proposal for a research and development program
[DFVLR-MITT-81-10] p0087 N82-15542
LIQUID METALS
Liquid-metal MHD for solar and coal
[DE81-023545] p0137 N82-10553
LIQUID PHASE EPITAXY
GaAs solar cells for space application
p0046 A82-11764

LIQUID WASTES
Chemical element concentrations in liquids and solids associated with power plants using FGD systems
[DE81-030422] p0027 N82-14322
LIQUID-VAPOR EQUILIBRIUM
Measured performance of falling-jet flash evaporators
[DE81-024355] p0161 N82-10565
LITHIUM FLUORIDES
Rechargeable lithium/vanadium oxide cells utilizing 2Me-THF/LiAsF6
p0154 A82-15726
LITHIUM SULFUR BATTERIES
Insoluble sulfide positive electrodes for organic electrolyte lithium secondary batteries
p0155 A82-15727
Recent progress in lithium/iron sulfide battery development
[DE81-023127] p0157 N82-10557
LITHOLOGY
Fracture flow of groundwater in coal-bearing strata
[DE81-023810] p0096 N82-10479
Geologic considerations in underground coal mining system design
[NASA-CR-164961] p0104 N82-11516
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] p0109 N82-12514
Stratigraphy and depositional history of the Iola Limestone Upper Pennsylvanian (Missourian), Northern Midcontinent U.S.
p0116 N82-14711
LOAD DISTRIBUTION (FORCES)
Load-change testing of a large commercial oxygen plant
[EPRI-WP-1824] p0096 N82-10275
LOAD TESTS
Regional load-curve models: Scenario and forecast using the DRI model
[DE81-904192] p0033 N82-15605
LOADS (FORCES)
An overview of fatigue failures at the Rocky Flats Wind System Test Center
p0125 A82-11828
LOGISTICS
The all electric airplane - Its development and logistic support
p0004 A82-14709
LONG TERM EFFECTS
Long-term performance of the Hunn passive solar residence
[DE81-028735] p0070 N82-11600
LOW COST
Low-cost solar flat-plate-collector development
[DE81-025081] p0070 N82-11584
LOW SPEED WIND TUNNELS
The effect of shielding on the aerodynamic performance of Savonius wind turbines
p0125 A82-11826
LOW TEMPERATURE
Effects of low temperature periodic annealing on the deep-level defects in 200 keV proton irradiated AlGaAs-GaAs solar cells
p0061 A82-18287
LOW TEMPERATURE ENVIRONMENTS
Experimental study of fuel heating at low temperatures in a wing tank model, volume 1
[NASA-CR-165391] p0100 N82-11224
LUBRICANTS
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] p0030 N82-15453

M

MAGNESIUM
Hydrogen generation by means of catalyzed Mg-Al hydrolysis
p0083 A82-10398
MAGNESIUM COMPOUNDS
The storage of hydrogen in the form of metal hydrides: An application to thermal engines
[NASA-TM-76609] p0086 N82-11225
MAGNESIUM OXIDES
Improved efficiency in the sulfur dioxide - Iodine hydrogen cycle through the use of magnesium oxide
p0083 A82-11784
MAGNETIC DISPERSION
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-028060] p0108 N82-12263
MAGNETIC FIELD CONFIGURATIONS
Nonlinear development of magnetic reconnection in the tearing-type and the Petschek-type field geometries
p0132 A82-17015
MAGNETIC INDUCTION
Wind-energy recovery by a static Scherbius induction generator
p0131 A82-15650
MAGNETIC SURVEYS
Geophysical survey, Paso Robles geothermal area, California, part of the resource assessment of low- and moderate-temperature geothermal resource areas in California
[DE81-026038] p0109 N82-12517
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] p0119 N82-15656
MAGNETIC SUSPENSION
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-028060] p0108 N82-12263
MAGNETOHYDRODYNAMIC GENERATORS
Correlation between results of zone method and experiment in radiative heat transfer
[ASME PAPER 81-HT-71] p0121 A82-10958
Advances in coal fired MHD generator research
p0126 A82-11853
Status report on MHD generator materials
p0126 A82-11854
Flow aerodynamics modeling of an MHD swirl combustor - Calculations and experimental verification
p0127 A82-12113
Ionization waves in an argon discharge in a longitudinal gas flow
p0127 A82-12666
Increasing power and efficiency by dynamic suppression of ionization instability in a plasma
p0127 A82-12897
Assessment of MHD power plants with coal gasification
[AIAA PAPER 81-2574] p0129 A82-14030
A design for an MHD power plant as a prime mover for a Naval Vessel
[AIAA PAPER 81-2575] p0129 A82-14032
Problems and potential for MHD retrofit of existing coal-fired plants
[AIAA PAPER 81-2586] p0130 A82-14036
Industrial applications of MHD high temperature air heater technology
[AIAA PAPER 81-2588] p0130 A82-14037
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design --- Engineering Test Facility
[AIAA PAPER 82-0325] p0135 A82-17889
Optical diagnostic techniques for coal-fired MHD applications
[AIAA PAPER 82-0377] p0135 A82-17913
MHD coal combustor development
[AIAA PAPER 82-0380] p0135 A82-17914
MHD generator scaling analysis for baseload commercial power plants
[AIAA PAPER 82-0394] p0135 A82-17922
Loading schemes for a 50 MW/th/ diagonally connected MHD generator
[AIAA PAPER 82-0395] p0135 A82-17923
Impact of uniform electrode current distribution on ETF --- Engineering Test Facility MHD generator
[AIAA PAPER 82-0423] p0135 A82-17941
Magnetohydrodynamics MHD Engineering Test Facility ETF 200 MWe power plant. Conceptual Design Engineering Report CDER. Volume 3: Costs and schedules
[NASA-CR-165452-VOL-3] p0137 N82-10495
Liquid-metal MHD for solar and coal
[DE81-023545] p0137 N82-10553
Key contributions in MHD power generation
[DE81-028121] p0138 N82-10882
One-dimensional equilibrium-chemistry flow model for coal combustors
[DE81-027622] p0099 N82-11158
Mass spectrometric studies of MHD slag thermochemistry
[PB81-221434] p0138 N82-11173

Magnetohydrodynamic research program of the MHD Energy center at Mississippi State University and structural features of MHD radiant boilers
[DE81-029901] p0139 N82-11934
Development, testing, and evaluation of MHD materials and component designs. Volume 1: Executive summary
[DE81-026203] p0139 N82-11947
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] p0140 N82-12446
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Conceptual Design Engineering Report (CDER). Volume 1: Executive summary
[NASA-CR-165452-VOL-1] p0140 N82-12570
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design
[NASA-TM-82748] p0141 N82-12943
Two-dimensional effects in power take-off region
[DE82-000091] p0141 N82-13367
Electrical effects of slag in a diffuse mode magnetohydrodynamic generator
p0143 N82-13550
Testing and evaluation of MHD materials and substructures
[DE81-024331] p0143 N82-13926
Conceptual design of superconducting magnet system for Magnetohydrodynamic (MHD) Engineering Test Facility (ETF) 200 MWe power plant
[NASA-CR-165053] p0143 N82-14520
Advanced solar energy conversion --- solar pumped gas lasers
[NASA-CR-165060] p0079 N82-15526
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] p0144 N82-15527

MAGNETOHYDRODYNAMIC STABILITY
The tilting mode in field-reversed configurations --- stability of toroidal plasma equilibria
p0121 A82-11131
Increasing power and efficiency by dynamic suppression of ionization instability in a plasma
p0127 A82-12897
Nonlinear development of magnetic reconnection in the tearing-type and the Petschek-type field geometries
p0132 A82-17015

MAGNETORESISTIVITY
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] p0119 N82-15661

MAGNETRONS
The adapting of the crossed-field directional amplifier to the requirements of the SPS
p0148 N82-12554

MAGNETS
A hidden advantage of permanent magnet electrical generating systems
p0122 A82-11720

MAINE
Peat resource evaluation: State of Maine
[DE82-000227] p0109 N82-12523

MANAGEMENT
Satellite power system: Concept development and evaluation program. Volume 4: Energy conversion and power management
[NASA-TM-58237-VOL-4] p0078 N82-14634
Seminars for private college administrators on solar applications for college buildings
[DE81-027981] p0079 N82-14661

MANAGEMENT ANALYSIS
Analysis report: Applied analysis model summaries
[DE81-029278] p0018 N82-12526

MANAGEMENT INFORMATION SYSTEMS
Millions wasted trying to develop major energy information system
[AFMD-81-40] p0029 N82-14959

MANAGEMENT PLANNING
Need for power and the choice of technologies: State decisions on electric power facilities
[DE81-025960] p0027 N82-14644

MANAGEMENT SYSTEMS
Fuel efficient flight profiles in an ATC flow management environment
p0002 A82-13078
Solar data base management system
[DE81-023122] p0066 N82-10502

MANGANESE IONS
Photoanode on the base of pheophytin-sensitized reactions
p0059 A82-16702

MANIFOLDS
An analytical comparison of the efficiency of solar thermal collector arrays with and without external manifolds
[NASA-CR-161852] p0063 N82-10501

MANUFACTURING
Energy end-use requirements in manufacturing, volume 1
[DE81-028975] p0064 N82-10512
Energy end-use requirements in manufacturing, volume 3
[DE81-027976] p0007 N82-10544
The effects of impurities on the performance of silicon solar cells
[NASA-CR-164945] p0067 N82-11548

MAPPING
Peat resource evaluation: State of Maine
[DE82-000227] p0109 N82-12523

MARINE CHEMISTRY
Chemical and geochemical studies off the coast of Washington
[DE81-030319] p0017 N82-12513

MARINE ENVIRONMENTS
Environmental and radiological safety studies: Interaction of (238) PuO2 heat sources with terrestrial and aquatic environments
[DE81-032019] p0025 N82-13565
Environmental assessment of the Alaskan Continental Shelf: Annual reports of principal investigators for the year ending March 1980. Volume 5: Hazards
[PB81-225732] p0026 N82-13607
The Seasat commercial demonstration program
p0115 N82-14561

MARINE METEOROLOGY
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0027 N82-14557

MARINE RESOURCES
Maritime support for ocean-resources development
[AD-A104730] p0111 N82-12735

MARINE TECHNOLOGY
Maritime support for ocean-resources development
[AD-A104730] p0111 N82-12735

MARKET RESEARCH
Photovoltaic system studies and developments
p0049 A82-11804
Market potential and problems for SSPS
p0050 A82-12502
Solar thermal cost goals - Implementing a methodology for assessing break-even value and market potential
[AIAA PAPER 81-2550] p0054 A82-14013
An estimate of OTEC costs, market potential and proof-of-concept vessel financing
[AIAA PAPER 81-2567] p0003 A82-14024
Market assessment of photovoltaic power systems for agricultural applications in Mexico
[NASA-CR-165441] p0007 N82-10506
Irrigation market for solar thermal parabolic dish systems
[NASA-CR-164955] p0068 N82-11549
National coal-market conditions for the year 2000: Regional-issue identification and analysis, high scenario
[DE81-026425] p0016 N82-11988
Assessment of potential future markets for the production of hydrogen from water
[BNFT-FB-T-81-012] p0086 N82-12266
Market assessment of photovoltaic power systems for agricultural applications in Morocco
[NASA-CR-165477] p0077 N82-14627
International energy indicators
[DE81-028117] p0028 N82-14653
Systems analysis of hydrogen/natural gas supplementation and separation
[DE81-021383] p0087 N82-15220

MARKETING
Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029611] p0073 N82-12618

MARKOV PROCESSES
The effect of non-Markovian cloud patterns on the design of a regulator for a solar-powered boiler
p0052 A82-13083
MASS FLOW
Density-measurement studies at the BI-GAS pilot plant
[DE82-000910] p0108 N82-12262
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] p0119 N82-15604
MASS SPECTROMETERS
Soot formation in synfuels
[DE81-030273] p0099 N82-11164
MASS SPECTROSCOPY
Vaporization and chemical transport under coal gasification conditions
[PB81-245839] p0117 N82-15165
MASS TRANSFER
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] p0030 N82-15367
MASSACHUSETTS
Planning a comprehensive program for exploration of the anthracite deposits of the Narragansett Basin of Massachusetts and Rhode Island, phase 1 and 2
[DE81-028490] p0104 N82-11519
Exploration of coal and anthracitic carbonaceous shale resources, Narragansett Basin, Massachusetts, and Rhode Island
[DE81-030895] p0104 N82-11523
Intermediate photovoltaic system application experiment operational performance report. Volume 2 for Beverly High School, Beverly, Mass.
[DE82-000811] p0077 N82-13532
MATERIALS HANDLING
The storage of hydrogen
p0085 A82-17130
Aspects concerning the safety of hydrogen
p0085 A82-17132
Creating a safer environment in US coal mines: The Bureau of Mines Methane Control Program, 1964-79
[PB81-233918] p0112 N82-13488
MATERIALS RECOVERY
Ames Laboratory research report, 1980
[DE81-027399] p0161 N82-11012
Aluminum recovery from fly ash and shale-retort wastes
[DE81-027675] p0099 N82-11154
SOL-CYCLE: A solar-assisted solvent-recycling process for asphalt-impregnation of fiber board
[DE81-903377] p0070 N82-11615
Development of a process for recovery of valuable components from complex hydrodesulfurization catalysts especially tungsten, molybdenum, vanadium, nickel and cobalt
[BMFT-FB-T-80-186] p0016 N82-12204
Thermal processing of used catalysts
[BMFT-FB-T-80-189] p0016 N82-12205
Power-plant fly-ash utilization: A chemical-processing perspective
[DE81-025452] p0022 N82-13191
MATERIALS SCIENCE
Solar materials science --- Book
p0037 A82-10007
Introduction to solar materials science
p0037 A82-10008
Introduction to the role of crystal defects in solar materials
p0037 A82-10009
Surface and interface studies and the stability of solid solar energy materials
p0037 A82-10010
Materials science issues encountered during the development of thermochemical concepts --- in screening of reactions for solar energy applications
p0038 A82-10021
Research opportunities in new energy-related materials
p0161 A82-15377
MATERIALS TESTS
Introduction to photovoltaics - Physics, materials and technology
p0038 A82-10022
Status report on MHD generator materials
p0126 A82-11854
Use of ceramics in point-focus solar receivers
[AIAA PAPER 81-2552] p0054 A82-14015
MATHEMATICAL MODELS
A numerical model of a graded band gap CdS/x/Te/1-x/ solar cell
p0050 A82-12817
Mathematical simulation model for the operation of the optical system of a solar power station
p0053 A82-13718
An analytical model for high-low-emitter /HLE/ solar cells in concentrated sunlight
p0055 A82-15441
Theoretical and numerical resolution of a mathematical model of the release of solar energy from storage
p0061 A82-18232
A simplified model of the thermohydraulic behaviour of a linear collector network for the conversion of the solar energy
p0062 A82-18816
Review of simulation techniques for Aquifer Thermal Energy Storage (ATES)
[DE81-029943] p0156 N82-10532
Computational tools for pulverized-coal combustion
[DE81-028582] p0098 N82-11148
Tennessee Valley Authority atmospheric fluidized-bed combustor simulation
[DE81-030262] p0098 N82-11151
Vertical combustor for refuse combustion
[DE81-030002] p0098 N82-11152
LLNL underground coal gasification project
[DE81-030634] p0103 N82-11267
Irrigation market for solar thermal parabolic dish systems
[NASA-CR-164955] p0068 N82-11549
Study of photovoltaic cost elements. Volume 1: Executive report. Volume 2: Project background
[DE81-030982] p0069 N82-11566
Study of photovoltaic cost elements. Volume 4: Installation cost model for residential PV systems: Users manual
[DE81-031921] p0069 N82-11568
Study of photovoltaic cost elements. Volume 5: Installation cost model for intermediate PV systems: Users manual
[DE81-030981] p0069 N82-11569
RF-driven Tokamak reactor with sub-ignited, thermally stable operation
[DE81-029437] p0139 N82-11935
Assessment of pulverized-coal-fired combustor performance
[DE81-030860] p0105 N82-12187
Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-000482] p0106 N82-12200
Analysis report: Applied analysis model summaries
[DE81-029278] p0018 N82-12526
The history of the development of the rectenna
p0149 N82-12560
A theoretical study of microwave beam absorption by a rectenna
p0149 N82-12563
Impact of fuel-economy shortfall: Trends in technology-weighted EPA versus on-road MPG. Periodic analysis memorandum no. 1
[DE81-030841] p0020 N82-12667
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] p0021 N82-12842
Two-dimensional effects in power take-off region
[DE82-000091] p0141 N82-13367
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] p0119 N82-15560
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] p0032 N82-15602

Methodology and basic algorithms of the Livermore Economic Modeling System
[DE81-029430] p0035 N82-15833
Evaluating E and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] p0035 N82-16013

MATHEMATICAL PROGRAMMING
Focal plane flux distributions produced by solar concentrating reflectors
p0043 A82-11211

MATRICES (CIRCUITS)
The design of series-parallel connected thermionic converter arrays
p0124 A82-11820

MECHANICAL DRIVES
Performance analysis of d.c.-motor-photovoltaic converter system. II - Series and shunt excited motors
p0043 A82-11213
Controlled Speed Accessory Drive demonstration program
[NASA-CR-165010] p0026 N82-13981
Automotive fuel economy: Potential improvement through selected engine and differential gear lubricants
[PB81-240467] p0030 N82-15453

MECHANICAL OSCILLATORS
Dynamic stability of stacked disk type flywheels
[DE81-030008] p0156 N82-10535

MECHANICAL PROPERTIES
Energy and ceramics --- Book
p0005 A82-17076

MEDICAL SCIENCE
Health and safety research division
[DE81-026088] p0026 N82-13652

MELTING
Pulverized-coal firing of aluminum melting furnaces
[DOE/CS-40037/T2] p0095 N82-10262

MELTING POINTS
Thermodynamic basis for selecting heat storage materials
p0153 A82-10019

MERCURY CADMIUM TELLURIDES
Electrical properties of infrared photovoltaic Cd/x/Hg/1-x/Te detectors
p0136 A82-18466

MERCURY OXIDES
Energy storage systems for terrestrial solar generators --- cadmium/mercury oxide cells
[BMFT-FB-T-81-082] p0080 N82-15529

METABOLIC WASTES
Parallel evaluation of air-and oxygen-activated sludge
[PB81-246712] p0034 N82-15633

METAL COATINGS
Metallurgical coatings 1980; Proceedings of the Seventh International Conference, San Diego, CA, April 21-25, 1980. Volumes 1 & 2
p0161 A82-17251
Sputter-deposited Al2O3/Mo/Al2O3 selective absorber coatings
p0060 A82-17253

METAL COMPOUNDS
Solar chemistry of metal complexes --- hydrogen production
p0058 A82-16124

METAL FILMS
Composite film selective-absorbers --- for solar radiation collection
p0038 A82-10016
Optical properties of selectively absorbing chromium films deposited at oblique angle of incidence
p0040 A82-10467
Investigations on a Se-CdO photovoltaic cell
p0132 A82-16052
Characterization of selective solar absorber microstructures - Electron microscope studies
p0060 A82-17254
Development of an all-metal thick film cost effective metallization system for solar cells
[NASA-CR-165043] p0078 N82-14630
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] p0081 N82-15551

METAL HYDRIDES
Lightweight hydrides for automotive storage of hydrogen
p0084 A82-11790
Mechanically stable hydride composites designed for rapid cycling
p0084 A82-16347
Metal hydrides 1980; Proceedings of the International Symposium on the Properties and Applications of Metal Hydrides, Colorado Springs, CO, April 7-11, 1980. Volumes 1 & 2
p0085 A82-16784
The storage of hydrogen
p0085 A82-17130
Rechargeable metallic hydrides for hydrogen storage
p0085 A82-17150
Technical and economic aspects of hydrogen storage in metal hydrides
[NASA-TM-76610] p0086 N82-11223
The storage of hydrogen in the form of metal hydrides: An application to thermal engines
[NASA-TM-76609] p0086 N82-11225

METAL IONS
Assessment of water suppl, contamination due to underground coal gasification
[PB81-209215] p0021 N82-12680

METAL OXIDES
Investigations on a Se-CdO photovoltaic cell
p0132 A82-16052

METAL SURFACES
The emissivity of metals --- frequency and temperature dependence calculations for solar collector design
p0038 A82-10014
Effect of metal base layer on the absorptance and emittance of sputtered graded metal-carbon selective absorbing surfaces
p0040 A82-10469
Sputter etched metal solar selective absorbing surfaces for high temperature thermal collectors
p0057 A82-16057

METAL VAPORS
Selected studies of four high-temperature air-pollution sources
p0015 N82-11680

METALLIZING
Effects of processing parameters on thick film inks used for solar cell front metallization
p0058 A82-16474
High resolution, low cost solar cell contact development
[NASA-CR-165032] p0076 N82-13501
Development of an all-metal thick film cost effective metallization system for solar cells
[NASA-CR-165043] p0078 N82-14630

METEOROLOGICAL PARAMETERS
Environmental data for sites in the National Solar Data Network
[DE82-000071] p0075 N82-12707

METEOROLOGY
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] p0111 N82-12731

METHANATION
Pricetown 1 underground coal gasification field test: Operations report
[DE81-025162] p0095 N82-10268
Advanced system experimental facility: Solid waste to methane gas. Background and process description
[DE81-030198] p0101 N82-11284
Solar-central-receiver fuels and chemicals
[DE82-000941] p0077 N82-13530

METHANE
Methane production from alkaline food waste
p0092 N82-10115
Enhancement of methane gas production using an industrial waste in anaerobic digestion --- effects of chrome shavings from leather tanning
[DE81-023819] p0095 N82-10267
Production and utilization of methane from anaerobic sludge digestion in U.S. wastewater-treatment plants
[DE81-029958] p0101 N82-11246
Evaluation of landfill gas as an energy source --- feasibility of methane recovery from landfills
[DE82-000116] p0110 N82-12584

Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029028] p0110 N82-12605
Creating a safer environment in US coal mines: The Bureau of Mines Methane Control Program, 1964-79
[PB81-233918] p0112 N82-13488
Solar-central-receiver fuels and chemicals
[DE82-000941] p0077 N82-13530
Biomethanation of biomass pyrolysis gases
[DE82-000238] p0113 N82-13541
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] p0117 N82-15225
High-pressure solvent extraction of methane from geopressured fluids
[DE81-027713] p0117 N82-15227
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] p0032 N82-15602

METHODOLOGY
Implementation of a siting methodology for utility size WECS in western Massachusetts and northwestern Connecticut
[AIAA PAPER 81-2540] p0091 A82-14008

METHYL ALCOHOLS
Supercritical multicomponent solvent coal extraction
[NASA-CASE-NPO-15767-1] p0107 N82-12241
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] p0107 N82-12250
Investigation of the in-situ oxidation of methanol in fuel cells
[AD-A105947] p0143 N82-14642
The utilisation of alcohol in light duty diesel engines
[PB81-244469] p0118 N82-15452

METHYL COMPOUNDS
Dimethyl sulfate in particulate matter from coal- and oil-fired power plants
p0005 A82-16199

METHYLENE
Coal hydrogenation via bonding of metallic compounds to coal, part 1. Solubilization of Illinois bituminous coal - the critical importance of methylene group cleavage, part 2
[DE81-027562] p0100 N82-11236

MEXICO
Market assessment of photovoltaic power systems for agricultural applications in Mexico
[NASA-CR-165441] p0007 N82-10506

MICHIGAN
Project demonstration of wind-turbine electricity: Interconnecting a northern Michigan fruit farm with a major utility
[DE81-030950] p0138 N82-11380
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

MICROORGANISMS
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] p0110 N82-12620

MICROPROCESSORS
Microprocessor applications for the monitoring and control of gas supplies
[RRS-E-276] p0097 N82-10735
A central microprocessor controlled electrical storage heating system
[BRPT-PB-T-80-182] p0025 N82-13547

MICROSTRUCTURE
The optical properties-microstructure relationship in particulate media - Optical tailoring of solar absorbers
p0037 A82-10011
Characterization of selective solar absorber microstructures - Electron microscope studies
p0060 A82-17254

MICROWAVE ANTENNAS
Solar power satellite microwave power transmission and reception system
p0145 A82-11743
Antenna optimization and cost consideration for the Solar Power Satellite microwave system
p0145 A82-11744

MICROWAVE CIRCUITS
International Microwave Symposium, Los Angeles, CA, June 15-19, 1981, Proceedings
p0146 A82-17976

MICROWAVE EQUIPMENT
International Microwave Symposium, Los Angeles, CA, June 15-19, 1981, Proceedings
p0146 A82-17976
The adapting of the crossed-field directional amplifier to the requirements of the SPS
p0148 N82-12554

MICROWAVE TRANSMISSION
Solar power satellite microwave power transmission and reception system
p0145 A82-11743
Microwave power transmission by satellites
p0145 A82-12503
Mechanical and nonlinear effects in microwave power transmission
p0145 A82-12504
Space chamber experiments of ohmic heating by high power microwave from the Solar Power Satellite
p0145 A82-16991
International Microwave Symposium, Los Angeles, CA, June 15-19, 1981, Proceedings
p0146 A82-17976
Status of the microwave power transmission components for the solar power satellite
p0146 A82-17982
Investigation of direct solar-to-microwave energy conversion techniques
[NASA-CR-161883] p0067 N82-11544
Workshop on Microwave Power Transmission and Reception. Workshop paper summaries
[NASA-TM-84064] p0146 N82-12538
System performance conclusions
p0146 N82-12539
SPS large array simulation
p0071 N82-12540
An active alignment scheme for the MPTS array
p0147 N82-12541
Ionospheric power beam studies
p0147 N82-12542
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal
p0147 N82-12543
Design and breadboard evaluation of the SPS reference phase control system concept
p0072 N82-12545
Coherent multiple tone technique for ground based SPS phase control
p0147 N82-12546
An interferometer-based phase control system
p0147 N82-12547
A sonic satellite power system microwave power transmission simulator
p0147 N82-12548
SPS phase control studies
p0147 N82-12549
SPS fiber optic link assessment
p0147 N82-12550
Ionospheric effects in active retrodirective array and mitigating system design
p0147 N82-12551
High efficiency SPS klystron design
p0148 N82-12552
Analytic investigation of efficiency and performance limits in klystron amplifiers using multidimensional computer programs; multi-stage depressed collectors; and thermionic cathode life studies
p0148 N82-12553
The adapting of the crossed-field directional amplifier to the requirements of the SPS
p0148 N82-12554
SPS antenna element evaluation
p0148 N82-12555
The Resonant Cavity Radiator (RCR)
p0148 N82-12556
Evaluation of thick wall wave guide element
p0148 N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS
p0148 N82-12558
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays
p0148 N82-12559

The history of the development of the rectenna
p0149 N82-12560
Rectenna system design
p0149 N82-12561
Rectenna session: Micro aspects
p0149 N82-12562
A theoretical study of microwave beam absorption by a rectenna
p0149 N82-12563
Rectenna array measurement results
p0149 N82-12564
Session on solid state: Introduction
p0149 N82-12565
Modified reference SPS with solid state transmitting antenna
p0149 N82-12566
SPS solid state antenna power combiner
p0149 N82-12567
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite
p0149 N82-12568
Effects of the Satellite Power System on low Earth orbit and geosynchronous satellites
[PB81-232019] p0150 N82-13157

MICROWAVES
Chronic exposure of a honey bee colony to 2.45 GHz continuous wave microwaves
p0003 A82-14347

MILITARY AIR FACILITIES
Geothermal-resource verification for Air Force Bases
[DE81-027482] p0112 N82-13520

MILITARY SPACECRAFT
Thermionic application for future air force space power systems
p0124 A82-11822

MILK
Ethanol production in southern tier east region of New York: Technical and economic feasibility
[PB81-226979] p0011 N82-11275

MINERAL DEPOSITS
Geology of the nahcolite deposits and associated oil shales of the Green River Formation in the Piceance Creek Basin, Colorado
p0105 N82-11683

MINERAL EXPLORATION
Planning a comprehensive program for exploration of the anthracite deposits of the Narragansett Basin of Massachusetts and Rhode Island, phase 1 and 2
[DE81-028490] p0104 N82-11519
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0118 N82-15489
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] p0160 N82-15558

MINERAL METABOLISM
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] p0110 N82-12693

MINES
Evaluation of novel underground transport systems
[DE81-030279] p0146 N82-12520

MINES (EXCAVATIONS)
Computer models to support investigations of surface subsidence and associated ground motion induced by underground coal gasification
[DE81-027131] p0015 N82-11712
Suppression of coal dust explosion by water barrier in a conveyor belt entry
[PB81-233306] p0024 N82-13489

MINING
Feasibility of a small scale pumped storage demonstration project, Hibbing, Minnesota
[DE81-028678] p0155 N82-10525
Geologic considerations in underground coal mining system design
[NASA-CR-164961] p0104 N82-11516
Energy analysis of human ecosystems in an Appalachian coal county
[DE81-025177] p0013 N82-11574
Feasibility analysis of trench strip and auger mining
[DE81-027557] p0017 N82-12521
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] p0146 N82-12525
Longwall mining of thin seams
[DE81-028042] p0116 N82-14612

MINNESOTA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604
Development of peatlands in northern Minnesota
[DE82-000873] p0112 N82-13475

MINORITY CARRIERS
Dependence of minority carrier diffusion length on illumination level and temperature in single crystal and polycrystalline Si solar cells
p0053 A82-13804
Effect of junction depth on the performance of a diffused n/+/p silicon solar cell
p0056 A82-15444
A method for experimental assessment of the shifting approximation, with application to polysilicon solar cells --- effect of constant series resistance
p0058 A82-16131

MIRRORS
Solar mirror materials - Their properties and uses in solar concentrating collectors
p0037 A82-10012
The effect of soiling on solar mirrors and techniques used to maintain high reflectivity
p0037 A82-10013
Fundamental limits to the spectral selectivity of composite materials --- for absorbing solar radiation
p0038 A82-10015
Composite film selective-absorbers --- for solar radiation collection
p0038 A82-10016
Investigation of abrasive action of atmospheric particles on the reflectance of mirrors
p0040 A82-10388
Mathematical simulation model for the operation of the optical system of a solar power station
p0053 A82-13718
Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209
Secondary and compound concentrators for parabolic dish solar thermal power systems
[NASA-CR-164960] p0068 N82-11550
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] p0081 N82-15551

MIS (SEMICONDUCTORS)
Temperature dependence of the short-circuit current in MIS solar cells
p0052 A82-12825
A pinhole model for metal-insulator-semiconductor solar cells
p0056 A82-15442
Effects of double-exponential current-voltage characteristics on the performance of solar cells
p0058 A82-16472

MISSILE SILOS
Configuration selection study for isolated loads using parabolic dish modules
[AIAA PAPER 81-2549] p0061 A82-10223

MISSOURI
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

MISSOURI RIVER (US)
Synthetic fuel development for the Upper Missouri River Basin. Section 13: Water assessment report
[PB81-224537] p0011 N82-11276

MOBILITY
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] p0081 N82-15544

MODULATORS
Solar energy modulator
[NASA-CASE-NPO-15388-1] p0063 N82-10496

MOLECULAR BEAM EPITAXY
A new low temperature III-V multilayer growth technique - Vacuum metalorganic chemical vapor deposition --- of GaAs thin films
p0053 A82-13803

MOLECULAR STRUCTURE
Soot formation in synfuels
[DE81-030273] p0099 N82-11164
MOLTEN SALT ELECTROLYTES
Rechargeable molten-salt cells
[DE81-027091] p0158 N82-11595
MOLTEN SALTS
Development of a solar thermal central heat receiver using molten salt
[ASME PAPER 81-SOL-2] p0041 A82-10970
Molten salt thermal energy storage subsystem for Solar Thermal Central Receiver plants
p0047 A82-11780
Molten-salt coal-gasification process development unit, phase 2
[DE81-023585] p0094 N82-10251
MOLYBDENUM
Sputter-deposited Al2O3/Mo/Al2O3 selective absorber coatings
p0060 A82-17253
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030857] p0108 N82-12259
MOLYBDENUM DISULFIDES
Investigation of the performance of an MoS2/I-/I2/C electrochemical solar cell
p0053 A82-13805
MOLYBDENUM SULFIDES
Photoelectrochemical cells using polycrystalline and thin film MoS2 electrodes
p0057 A82-16053
MOMENT DISTRIBUTION
An indoor blade test facility for determining the basic aerodynamic properties of Darrieus wind turbine airfoils with test results for an NACA 0015 and a modified section
p0136 N82-10005
MONITORS
Microprocessor applications for the monitoring and control of gas supplies
[ERS-E-276] p0097 N82-10735
MONTANA
Feasibility and economic study of medium-Btu coal gas blended with high-Btu by-product gas as an industrial energy source at Billings, Montana
[DE81-030622] p0107 N82-12254
Environmental effects of pollutants from coal combustion. 2: The Colstrip, Montana Power Plant
[PB81-234114] p0026 N82-13573
MOROCCO
Market assessment of photovoltaic power systems for agricultural applications in Morocco
[NASA-CR-165477] p0077 N82-14627
MX MISSILE
Configuration selection study for isolated loads using parabolic dish modules
[AIAA PAPER 81-2549] p0061 A82-18223

N

N-TYPE SEMICONDUCTORS
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] p0081 N82-15569
NAPHTHENES
Thermolysis of naphthols
[DE81-029684] p0116 N82-15152
NASA PROGRAMS
Advances in space power research and technology at the National Aeronautics and Space Administration
p0122 A82-11755
Lewis Research Center's coal-fired, pressurized, fluidized-bed reactor test facility
[NASA-TM-81616] p0103 N82-11397
NATURAL GAS
Microprocessor applications for the monitoring and control of gas supplies
[ERS-E-276] p0097 N82-10735
Brayton/Rankine 10-ton gas-fired space conditioning system, phase 2
[PB81-223372] p0139 N82-11478
Petroleum geology and resource assessment of the middle Caspian Basin, USSR, with special emphasis on the Uzen field
[DE81-029951] p0104 N82-11518
Environmental research plan for gas supply technologies. Volume 1: Executive summary
[PB81-222309] p0015 N82-11657
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] p0020 N82-12641
Natural gas plan needed to provide greater protection for high-priority and critical uses
[PB81-228488] p0023 N82-13255
Development of a metal hydride process for hydrogen recovery from supplemented natural gas
[DE81-022685] p0006 N82-14382
International energy indicators
[DE81-028117] p0028 N82-14653
NATURAL GAS EXPLORATION
Sulfur pollution control. Phase 1: The disposal program (sections 5 through 7)
[PB81-222804] p0015 N82-11655
Evaluation of Devonian shale potential in eastern Kentucky/Tennessee
[DE82-001164] p0116 N82-14595
NETWORK ANALYSIS
Calculation of the top loss coefficient by the network method and applications to solar collectors
p0056 A82-15653
NEVADA
Low-to-moderate temperature geothermal resource assessment for Nevada, area specific studies
[DE81-030487] p0096 N82-10475
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] p0109 N82-12516
NEW MEXICO
Schlumberger resistivity study of the Jemez Springs region of northwestern New Mexico
[DE81-025302] p0119 N82-15661
NEW YORK
Ethanol production in southern tier east region of New York: Technical and economic feasibility
[PB81-226979] p0011 N82-11275
NEWS MEDIA
Progress report to the Department of Energy in support of basic energy and policy research
[DE81-025882] p0028 N82-14648
NICKEL ALLOYS
Workshop proceedings: U-bend tube cracking in steam generators
[DE81-903765] p0142 N82-13515
NICKEL COATINGS
Characterization of selective solar absorber microstructures - Electron microscope studies
p0060 A82-17254
NICKEL COMPOUNDS
Nickel sulphide-lead sulphide and nickel sulphide-cadmium sulphide selective coatings for solar thermal conversion
p0059 A82-16745
NICKEL HYDROGEN BATTERIES
The nickel-hydrogen battery system - An historical overview
p0153 A82-11735
NICKEL ZINC BATTERIES
Near-term batteries for electric vehicles
[DE81-023543] p0157 N82-10556
Investigation of the zinc electrode reaction --- nickel zinc batteries
[DE81-030221] p0157 N82-11368
Development of battery separator composites
[NASA-CR-165508] p0157 N82-11547
NICKEL-IRON BATTERIES
Near-term batteries for electric vehicles
[DE81-023543] p0157 N82-10556
NIGERIA
Oil and gas industry and environmental pollution: Application of systems reliability analysis for the evaluation of the status of environmental pollution control in the Nigerian petroleum industry
p0008 N82-10583
NITRATES
Development of a solar thermal central heat receiver using molten salt
[ASME PAPER 81-SOL-2] p0041 A82-10970

NITRIC OXIDE
Fundamentals of nitric oxide formation in fossil-fuel combustion
[DE81-030329] p0033 N82-15608

NITRIDES
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts
[DE81-030857] p0108 N82-12259

NITROGEN
Characterization of diesel emissions as a function of fuel variables
[PB81-244048] p0118 N82-15233

NITROGEN OXIDES
Kinetics of NO/ sub x formation during early stages of pulverized-coal combustion
[DE81-029071] p0014 N82-11641
Control of utility boiler and gas turbine pollutant emissions by combustion modification, phase 2
[PB81-222267] p0015 N82-11654
Fuel nitrogen conversion during fuel rich combustion of pulverized coal and char
p0105 N82-12156
Low NO sub x heavy fuel combustor concept program
[NASA-CR-165512] p0140 N82-12572
Testing and evaluation of MHD materials and substructures
[DE81-024331] p0143 N82-13926
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] p0033 N82-15607

NITROSYL CHLORIDES
Brayton cycle using dissociating nitrosyl chloride
p0126 A82-11852

NOISE REDUCTION
Establishment of noise acceptance criteria for wind turbines
p0125 A82-11825
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
[DE81-029833] p0022 N82-13014

NONEQUILIBRIUM THERMODYNAMICS
Is geothermal simulation a catastrophe?
[DE81-026750] p0105 N82-11588

NONLINEAR EQUATIONS
Nonlinear development of magnetic reconnection in the tearing-type and the Petschek-type field geometries
p0132 A82-17015

NONLINEARITY
Mechanical and nonlinear effects in microwave power transmission
p0145 A82-12504

NONUNIFORM FLOW
Effect of inhomogeneous flow distribution in a system of heat-generating solar collectors
p0044 A82-11423

NORTH CAROLINA
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] p0109 N82-12524

NORTH DAKOTA
Great Plains gasification project, Mercer County, North Dakota; water assessment report section 13(c)
[PB81-216111] p0013 N82-11524
Great Plains gasification project, Mercer County, North Dakota; water assessment report
[PB81-216129] p0013 N82-11525
Status of the Great Plains coal gasification plant
[ESD-81-64] p0107 N82-12242
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

NORTHERN HEMISPHERE
The annual variation of atmospheric CO2 concentration observed in the Northern Hemisphere
p0002 A82-12156

NORWAY
Plan for technological research and development related to the petroleum activities on the Norwegian Continental Shelf. 1981-1985: Appendixes: 1. Technical challenges. 2. Research requirements. 3. High priority programs
[DE81-904014] p0104 N82-11520

NOZZLE FLOW
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386

NUCLEAR ELECTRIC POWER GENERATION
Nuclear electric power for space systems - Technology background and flight systems program
p0123 A82-11756
International energy indicators
[DE81-028117] p0028 N82-14453
Failure mode analysis using state variables derived from fault trees with application
[DE81-030239] p0144 N82-15454

NUCLEAR ELECTRIC PROPULSION
Heat pipes for NEP spacecraft radiators
p0122 A82-11741
Advanced high temperature thermoelectrics for space power
p0125 A82-11823

NUCLEAR ENERGY
Energy for the year 2000 --- Book
p0006 A82-18120

NUCLEAR FUELS
Application of different KFA-models in the framework of the energy research programme of the European Communities
[EUR-6758-EN] p0019 N82-12597
Space nuclear safety and fuels program
p0111 N82-12921
Value tree analysis of energy supply alternatives
[AD-A105629] p0029 N82-14875

NUCLEAR FUSION
Fusion as a source of synthetic fuels
[BNL-29281] p0086 N82-11257
Technology of controlled nuclear fusion
[DE81-027361] p0144 N82-15893

NUCLEAR HEAT
Application of HTGR process heat to oil shale retorting
p0090 A82-11851

NUCLEAR POWER PLANTS
Low-level radioactive waste: An introductory overview
[DE81-026334] p0022 N82-12924
The nuclear controversy: Unequal competition in public policy-making
[EPG-035] p0027 N82-14626
Ecological effects assessment: Requirements vs state-of-the-art
[DE81-028092] p0032 N82-15598

NUCLEAR POWER REACTORS
Applications of power beaming from space-based nuclear power stations
p0145 A82-11746
Low-level radioactive waste: An introductory overview
[DE81-026334] p0022 N82-12924

NUCLEAR REACTORS
Thermionic application for future air force space power systems
p0124 A82-11822

NUMERICAL ANALYSIS
The effect of variable fluid properties on scale modeling --- of solar central receivers
p0049 A82-12269
Computational analysis of diffuser-augmented wind turbines
p0132 A82-16743
Theoretical and numerical resolution of a mathematical model of the release of solar energy from storage
p0061 A82-18232

NUMERICAL CONTROL
Optical diagnostic techniques for coal-fired MHD applications
[AIAA PAPER 82-0377] p0135 A82-17913
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] p0159 N82-12445
Vertical-axis wind-turbine control strategy
[DE81-031932] p0141 N82-12591

NUMERICAL FLOW VISUALIZATION
A numerical model for the flow within the tower of a tornado-type wind energy system
p0131 A82-14844

O

OCCUPATION
Education and training implications of biomass energy system use
[DE81-029956] p0028 N82-14664

OCEAN BOTTOM
Maritime support for ocean-resources development
[AD-A104730] p0111 N82-12735

OCEAN CURRENTS
Turbines in the ocean
p0132 A82-16844
Ocean energy-waves, currents, and tides
[DE81-025708] p0105 N82-11611
Oceans and ocean currents: Their influence on climate
[DE81-027263] p0016 N82-11731

OCEAN DATA ACQUISITIONS SYSTEMS
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] p0118 N82-15508

OCEAN DYNAMICS
The Seasat commercial demonstration program
p0115 N82-14561

OCEAN TEMPERATURE
Experimental demonstration of the feasibility of the Mist Flow Ocean Thermal Energy Process
[AIAA PAPER 81-2596] p0136 A82-18220

OCEAN THERMAL ENERGY CONVERSION
Small-scale uses and costs of hydrogen derived from OTEC ammonia
p0084 A82-11792
Review of electrochemical energy conversion and storage for ocean thermal and wind energy systems
p0126 A82-11832
Proposed 12.5 MWe shelf-mounted OTEC pilot plant for power, water and mariculture at St. Croix
[AIAA PAPER 81-2546] p0127 A82-14011
Alternative ocean energy products and hybrid geothermal-OTEC /GEOTEC/ plants
[AIAA PAPER 81-2547] p0128 A82-14012
Proposed 10 MWe OTEC pilot plant for the Commonwealth of the Northern Mariana Islands
[AIAA PAPER 81-2561] p0128 A82-14020
Florida's proposed OTEC pilot plant for Key West
[AIAA PAPER 81-2563] p0003 A82-14021
An estimate of OTEC costs, market potential and proof-of-concept vessel financing
[AIAA PAPER 81-2567] p0003 A82-14024
OTEC ocean system development
[AIAA PAPER 81-2590] p0130 A82-14038
Turboexpanders for OTEC power plants
[AIAA PAPER 81-2592] p0003 A82-14040
Experimental demonstration of the feasibility of the Mist Flow Ocean Thermal Energy Process
[AIAA PAPER 81-2596] p0136 A82-18220
Overview and FY 1981 progress on open-cycle OTEC power systems
[DE81-029277] p0144 N82-15580

OCEANOGRAPHIC PARAMETERS
Oceans and ocean currents: Their influence on climate
[DE81-027263] p0016 N82-11731

OCEANOGRAPHY
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0027 N82-14557

OFFSHORE ENERGY SOURCES
Waves of energy
p0121 A82-10450
Alternative ocean energy products and hybrid geothermal-OTEC /GEOTEC/ plants
[AIAA PAPER 81-2547] p0128 A82-14012
Turbines in the ocean
p0132 A82-16844
International Symposium on Wave and Tidal Energy, 2nd, St. John's College, Cambridge, England, September 23-25, 1981, Proceedings
p0135 A82-18124
Petroleum geology and resource assessment of the middle Caspian Basin, USSR, with special emphasis on the Uzen field
[DE81-029951] p0104 N82-11518
Plan for technological research and development related to the petroleum activities on the Norwegian Continental Shelf. 1981-1985: Appendixes: 1. Technical challenges. 2. Research requirements. 3. High priority programs
[DE81-904014] p0104 N82-11520
Oceans and ocean currents: Their influence on climate
[DE81-027263] p0016 N82-11731
Environmental assessment of the Alaskan Continental Shelf: Annual reports of principal investigators for the year ending March 1980. Volume 5: Hazards
[PB81-225732] p0026 N82-13607
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0027 N82-14557
The Seasat commercial demonstration program
p0115 N82-14561

OFFSHORE REACTOR SITES
Alternate hybrid power sources for remote site applications
[AD-A099471] p0024 N82-13512

OHIO
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

OIL EXPLORATION
Development of organic geochemical and isotope techniques for hydrocarbon exploration
[BMFT-FB-T-80-076] p0097 N82-10482
Plan for technological research and development related to the petroleum activities on the Norwegian Continental Shelf. 1981-1985: Appendixes: 1. Technical challenges. 2. Research requirements. 3. High priority programs
[DE81-904014] p0104 N82-11520
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] p0110 N82-12693
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0027 N82-14557
Bibliography of publications dealing with tar sands
[DE81-026146] p0115 N82-14594
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0118 N82-15489

OIL FIELDS
Oil and gas industry and environmental pollution: Application of systems reliability analysis for the evaluation of the status of environmental pollution control in the Nigerian petroleum industry
p0008 N82-10583
Petroleum geology and resource assessment of the middle Caspian Basin, USSR, with special emphasis on the Uzen field
[DE81-029951] p0104 N82-11518

OIL POLLUTION
Pollution of the soil by aviation gasoline
[FHL-1979-41] p0032 N82-15596

OIL RECOVERY
Tertiary oil recovery processes research at the University of Texas
[DE81-025222] p0096 N82-10477
Ion exchange characteristics of enhanced oil recovery systems (miscibility studies)
[DE81-769734] p0096 N82-10478
Oil and gas industry and environmental pollution: Application of systems reliability analysis for the evaluation of the status of environmental pollution control in the Nigerian petroleum industry
p0008 N82-10583
Algorithm for computing in-situ combustion oil recovery performance
[DE81-030340] p0098 N82-11153
Microemulsions, emulsions and related systems: Energy applications
p0113 N82-13545
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522

Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523
Bibliography of publications dealing with tar sands
[DE81-026146] p0115 N82-14594
Progress report to the Department of Energy in support of basic energy and policy research
[DE81-025882] p0028 N82-14648
Relational methodology for integrating and analyzing field test and research data describing enhanced oil recovery
[DE81-030441] p0118 N82-15508
Improved polymers for enhanced oil recovery synthesis and rheology
[DE81-030194] p0118 N82-15509
Potential environmental problems of enhanced oil and gas recovery techniques
[PB81-240186] p0034 N82-15637

OIL SLICES
Oil and gas industry and environmental pollution: Application of systems reliability analysis for the evaluation of the status of environmental pollution control in the Nigerian petroleum industry
p0008 N82-10583
Oil spill identification by chemical analysis
p0115 N82-14583

OPEN CIRCUIT VOLTAGE
Numerical simulation of solar cell open circuit voltage decay
p0041 A82-10658
Investigations of the OCVD transients in solar cells --- Open Circuit Voltage Decay
p0043 A82-11334
Multijunction high voltage concentrator solar cells
p0047 A82-11796
Current-voltage characteristics of semiconductor-electrolyte junction solar cells
p0055 A82-15112
Theory of back surface field silicon solar cells
p0056 A82-15447
Influence of the junction area to edge area ratio on the open-circuit voltage of silicon solar cells
p0058 A82-16133
Effects of double-exponential current-voltage characteristics on the performance of solar cells
p0058 A82-16472

OPERATIONAL HAZARDS
Operations of small wind turbines on a distribution system
p0133 A82-17633

OPERATIONAL PROBLEMS
Experiences with a Grumman windstream 25 --- horizontal axis wind turbine
p0134 A82-17638
Low-Btu gasification of coal for electric power generation, phase 1, 2, and 3
[DE81-029482] p0112 N82-13248

OPERATIONS RESEARCH
Measures of effectiveness of transportation systems management
[PB81-233684] p0026 N82-13984

OPTICAL MEASUREMENT
Optical diagnostic techniques for coal-fired MHD applications
[AIAA PAPER 82-0377] p0135 A82-17913

OPTICAL MEASURING INSTRUMENTS
An integrating sphere based on absolute method for measuring solar absorptance
p0058 A82-16247
Soot formation in synfuels
[DE81-030273] p0099 N82-11164

OPTICAL PROPERTIES
The optical properties-microstructure relationship in particulate media - Optical tailoring of solar absorbers
p0037 A82-10011
Optical properties of selectively absorbing chromium films deposited at oblique angle of incidence
p0040 A82-10467
Geometrical optical performance studies of a composite parabolic trough with a fin receiver
p0043 A82-11390
Analysis of the optical characteristics of solar collectors
p0052 A82-13715
Model based studies of some optical and electronic properties of narrow and wide gap materials
p0062 A82-18471

OPTICAL PUMPING
A solar simulator-pumped gas laser for the direct conversion of solar energy
p0044 A82-11710
Investigation of direct solar-to-microwave energy conversion techniques
[NASA-CR-161883] p0067 N82-11549

OPTICAL REFLECTION
Geometrical optical performance studies of a composite parabolic trough with a fin receiver
p0043 A82-11390
Solar concentrator panel and gore testing in the JPL 25-foot space simulator
[AIAA PAPER 81-2534] p0054 A82-14005
Aplanatic double reflection system for thermophotovoltaic applications - Design
p0060 A82-17293

OPTIMAL CONTROL
Performance analysis and simulation of the SPS reference phase control system
p0071 N82-12544
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] p0021 N82-12842

OPTIMIZATION
Antenna optimization and cost consideration for the Solar Power Satellite microwave system
p0145 A82-11744
Solar data base management system
[DE81-023122] p0066 N82-10952
An optimization model for energy generation and distribution in a dynamic facility
p0011 N82-11310
Modeling energy-conservation potentials of community energy-system technologies
[DE81-026059] p0013 N82-11589

OPTIONS
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] p0035 N82-16013

ORDER-DISORDER TRANSFORMATIONS
Introduction to the role of crystal defects in solar materials
p0037 A82-10009

ORGANIC COMPOUNDS
Evaluation of organic acids as fuel cell electrolytes
p0127 A82-12938
Insoluble sulfide positive electrodes for organic electrolyte lithium secondary batteries
p0155 A82-15727

ORGANIC WASTES (FUEL CONVERSION)
Methane production from alkaline food waste
p0092 N82-10115
Enhancement of methane gas production using an industrial waste in anaerobic digestion --- effects of chrome shavings from leather tanning
[DE81-023819] p0095 N82-10267
Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] p0110 N82-12596
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] p0110 N82-12620
Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] p0019 N82-12621
Costs for alternative grain-residue-collection systems
[DE81-029072] p0110 N82-12633
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030822] p0020 N82-12661
Biomass energy systems: Descriptions and employment requirements for typical operations
[DE82-000236] p0113 N82-13538

ORTHOTROPIC PLATES
Application of orthotropic plate theory to windmill blade design
p0121 A82-10978

OSCILLATING FLOW
Experimental and analytical investigation of a fluidic power generator
[JPL-PUB-81-100] p0142 N82-13386
OTTO CYCLE
Electric and hybrid vehicle environmental control subsystem study
[NASA-CR-164996] p0020 N82-12658
OUTGASSING
Outgassing of two synthetic fuels
[AD-A104580] p0100 N82-11231
OVERPRESSURE
Soviet UCG experience specifically related to field experiments in the United States
[DE81-028642] p0111 N82-13244
OVERVOLTAGE
Distributed photovoltaic systems: Utility interface issues and their present status
[NASA-CR-165019] p0076 N82-13492
OXIDATION
Peat biogasification development program
[DE81-028299] p0101 N82-11243
Vapor-phase cracking and wet oxidation as potential pollutant control techniques for coal gasification
[PB81-219594] p0015 N82-11661
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] p0106 N82-12199
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] p0021 N82-12674
Investigation of the in-situ oxidation of methanol in fuel cells
[AD-A105947] p0143 N82-14642
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] p0081 N82-15569
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] p0033 N82-15607
OXIDATION RESISTANCE
Oxidation of electrodeposited black chrome selective solar absorber films
p0060 A82-17255
OXIDATION-REDUCTION REACTIONS
Solar chemistry of metal complexes --- hydrogen production
p0058 A82-16124
Treatment of biomass-gasification wastewaters by wet-air oxidation
[DE82-000935] p0025 N82-13567
OXIDE FILMS
The contoured-oxide monolithic series-array solar battery
p0042 A82-11190
V2O5-Si photovoltaic cells
p0051 A82-12824
Oxide optimization at the p-Si/aqueous electrolyte interface
p0052 A82-13199
Oxidation of electrodeposited black chrome selective solar absorber films
p0060 A82-17255
OXIDES
MHD oxidant intermediate temperature ceramic heater study
[NASA-CR-165453] p0144 N82-15527
OXIDES PRODUCTION
Solar hydrogen system design considerations
p0084 A82-11788
Load-change testing of a large commercial oxygen plant
[EPRI-EP-1824] p0096 N82-10275

P

P-I-N JUNCTIONS
Stability of a-i-p amorphous silicon solar cells
p0043 A82-11343
A comparison of p-i-n and Schottky barrier hydrogenated amorphous silicon, a-Si:H, solar cells
p0060 A82-17649
Field nonuniformity due to photogenerated carriers in a p-i-n solar cell
p0060 A82-17650
P-N JUNCTIONS
Laser bonded n-GaAs/p-GaSb heterojunction intercell Ohmic contact
p0041 A82-10776
Effect of junction depth on the performance of a diffused n/+/p silicon solar cell
p0056 A82-15444
n-/indium tin oxide//p-InP solar cells
p0058 A82-16471
Electrical properties of infrared photovoltaic Cd/x/Hg/1-x/Te detectors
p0136 A82-18466
PACIFIC NORTHWEST (US)
Chemical and geochemical studies off the coast of Washington
[DE81-030319] p0017 N82-12513
Wind Power: Research on network wind power over the Pacific Northwest. Executive summary
[DE81-029360] p0142 N82-13519
PANELS
Solar concentrator panel and gore testing in the JPL 25-foot space simulator
[AIAA PAPER 81-2534] p0054 A82-14005
PARABOLIC BODIES
Frequency response analysis of fluid control systems for parabolic-trough solar collectors
[DE81-029293] p0064 N82-10513
PARABOLIC REFLECTORS
AAI Corporation receiver design experience in concentrating solar collectors
[ASME PAPER 81-SOL-1] p0041 A82-10969
Design and testing of a uniformly illuminating nontracking concentrator
p0042 A82-11209
Focal plane flux distributions produced by solar concentrating reflectors
p0043 A82-11211
Geometrical optical performance studies of a composite parabolic trough with a fin receiver
p0043 A82-11390
Ground-mounted thermal storage for the parabolic dish solar collector/Stirling engine system
p0047 A82-11781
Secondary concentrators for parabolic dish solar thermal power systems
p0048 A82-11798
The effect of concentrator field layout on the EE-1 small community solar power system
p0048 A82-11799
Development of a solar receiver for an organic Rankine cycle engine
p0048 A82-11800
Control system development for a 1 MW/e/ solar thermal power plant
p0048 A82-11801
Dish concentrators for solar thermal energy - Status and technology development
[AIAA PAPER 81-2530] p0053 A82-14001
Development, solar test, and evaluation of a high-temperature air receiver for point-focusing parabolic dish applications
[AIAA PAPER 81-2532] p0053 A82-14003
Solar energy system design: A simple method for sizing the collector field and thermal storage
[DE81-028852] p0065 N82-10541
Design, cost and performance comparisons of several solar thermal systems for process heat. Volume 1: Executive summary
[DE81-029881] p0069 N82-11576
Near-term improvements in parabolic troughs: An economic and performance assessment
[DE82-001158] p0073 N82-12615
PARABOLOID MIRRORS
Experimental investigation of parabolic-cylinder solar concentration with tubular heat receiver
p0040 A82-10389
Nonimaging concentrators for photovoltaic arrays in space
p0046 A82-11761
Theoretical analysis of the performance of a gravity-controlled solar concentrator
p0050 A82-12812
Use of ceramics in point-focus solar receivers
[AIAA PAPER 81-2552] p0054 A82-14015

Thermal deformation of concentrators in an antisymmetric temperature field p0062 A82-18698

PARAMETER IDENTIFICATION
Analysis of power, mass, and size parameters of solar vapor-turbine two-circuit systems with organic working bodies p0044 A82-11421
The universal plane method for calculating the dimensions of heliostats p0062 A82-18697

PARAMETERIZATION
Parametric sensitivity study for solar-assisted heat-pump systems
[DE81-030309] p0067 N82-11407

PARTICLE PRECIPITATION
The effect of soiling on solar mirrors and techniques used to maintain high reflectivity p0037 A82-10013

PARTICLE SIZE DISTRIBUTION
Pulverized-fuel combustion: Modeling and scaleup methodologies
[DE81-026546] p0093 N82-10158
Pulverized-coal firing of aluminum melting furnaces
[DOE/CS-40037/T2] p0095 N82-10262
Catalytic effect of iron in hydrogasification of coal
[DE81-023928] p0113 N82-14323

PARTICLES
Separation of particles from coal derived liquids via surface charge properties
[DE81-029088] p0092 N82-10141
Study of the formation of submicron particulates generated by coal combustion
[DE81-027447] p0008 N82-10586
Control of utility boiler and gas turbine pollutant emissions by combustion modification, phase 2
[PB81-222267] p0015 N82-11654
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] p0119 N82-15604
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] p0033 N82-15609

PARTICULATE SAMPLING
Informational report on the measurement and characterization of diesel exhaust emissions
[PB81-221251] p0009 N82-11175
Carcinogenic effects of coal-conversion materials
[DE81-028108] p0029 N82-14803

PAVEMENTS
Construction of a recycled Portland cement concrete pavement --- Connecticut expressway
[PB81-233553] p0023 N82-13267

PEAT
An overview of peat gasification p0089 A82-11848
Peat biogasification development program
[DE81-028299] p0101 N82-11243
Peat resource evaluation: State of Maine
[DE82-000227] p0109 N82-12523
Peat deposits of Dismal Swamp pocosins: Camden, Currituck, Gates, Pasquotank, and Perquimans Counties, North Carolina
[DE81-029642] p0109 N82-12524
Development of peatlands in northern Minnesota
[DE82-000873] p0112 N82-13475

PERFORMANCE PREDICTION
Modeling and testing a salt gradient solar pond in northeast Ohio p0043 A82-11210
Cost and performance projections for SPS photovoltaic blankets p0045 A82-11741
Heat pipes for MEP spacecraft radiators p0122 A82-11748
Overview of DOE's large stationary Stirling engine development program p0123 A82-11805
Theoretical analysis of the performance of a gravity-controlled solar concentrator p0050 A82-12812
A method for preliminary evaluation and sizing of solar thermal cogeneration system applications
[AIAA PAPER 81-2551] p0054 A82-14014
Methodology for the evaluation of aerodynamic performance and rotor optimization under constant RPMoperation
[AIAA PAPER 81-2560] p0128 A82-14019
Up- and down-wind rotor half interference model for VAWT --- Vertical Axis Wind Turbines
[AIAA PAPER 81-2579] p0129 A82-14031
An analytical model for high-low-emitter /HLE/ solar cells in concentrated sunlight p0055 A82-15041
Wind-energy recovery by a static Scherbius induction generator p0131 A82-15650
OASYS: A simulation tool for nonconventional energy applications analysis. Theoretical and operational description with user documentation
[DE81-029701] p0007 N82-10514
Tennessee Valley Authority atmospheric fluidized-bed combustor simulation
[DE81-030262] p0098 N82-11151
Algorithm for computing in-situ combustion oil recovery performance
[DE81-030340] p0098 N82-11153
The effects of impurities on the performance of silicon solar cells
[NASA-CR-164945] p0067 N82-11548
Jet impingement heat transfer enhancement for the GPU-3 Stirling engine
[NASA-TM-82727] p0140 N82-11993
Optimization of solar heating and cooling systems
[NP-1903997] p0072 N82-12599
Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] p0072 N82-12600
Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] p0074 N82-12625
Application of a gravity-driven wickless heat pipe for ice production in a cold energy storage system p0159 N82-13377
Performance predictions of passive solar commercial buildings
[DE81-027979] p0079 N82-15247

PERFORMANCE TESTS
Modeling and testing a salt gradient solar pond in northeast Ohio p0043 A82-11210
Performance analysis of d.c.-motor-photovoltaic converter system. II - Series and shunt excited motors p0043 A82-11213
An experimental study of SO3 dissociation as a mechanism for converting and transporting solar energy p0043 A82-11214
Development of space reactor core heat pipes p0122 A82-11747
Engineering development testing of the GPHS-RTG converter --- General Purpose Heat Source-Radioisotope Thermoelectric Generator for Galileo orbiter power supply p0122 A82-11752
Development free-piston Stirling test-bed engine p0123 A82-11808
The effect of shielding on the aerodynamic performance of Savonius wind turbines p0125 A82-11826
Performance testing of a Savonius windmill rotor in shear flows p0125 A82-11827
Progress in large area photovoltaic devices based on amorphous silicon alloys p0049 A82-11855
Variable speed wind turbine control system p0127 A82-11859
Investigation of the performance of an MoS2/I-/I2/C electrochemical solar cell p0053 A82-13805
Development, solar test, and evaluation of a high-temperature air receiver for point-focusing parabolic dish applications
[AIAA PAPER 81-2532] p0053 A82-14003
Wind turbine assisted diesel generator systems
[AIAA PAPER 81-2559] p0128 A82-14018
Alcoa vertical axis wind turbines p0133 A82-17628
Development of high-performance, high-reliability windpower generators p0134 A82-17640

Controlled velocity testing of small wind energy conversion systems - An evaluation of a technique
p0134 A82-17642

First results from the UMass wind tunnel test program --- for windpowered generator optimization
p0134 A82-17643

Performance testing and rating standards for Wind Energy Conversion Systems
p0135 A82-17646

The El Paso electric 20-kilowatt photovoltaic system [AIAA PAPER 82-0064]
p0060 A82-17761

The Lea county electric 100-kilowatt grid-connected photovoltaic system [AIAA PAPER 82-0067]
p0061 A82-17764

Performance of a small low speed Darrieus type rotor
p0136 A82-18328

Performance evaluation of the solar kinetics T-700 line concentrating solar collector [NASA-CR-161856]
p0063 N82-10502

Performance testing of the TOLTEC TI-410 concentrating solar collector [DE81-029994]
p0071 N82-11617

Evaluation of the micro-carburetor [NASA-CR-164958]
p0016 N82-11994

Rectenna array measurement results
p0149 N82-12564

Performance analysis of 11 Denver Metro passive homes [DE81-025473]
p0074 N82-12626

Passive/hybrid solar components: An approach to standard thermal test methods [PB81-227886]
p0077 N82-13549

PERIODIC VARIATIONS

Network wind power over the Pacific northwest. Appendix 1: Wind statistics summaries for the wind power data stations [DE81-029291]
p0112 N82-13518

PERMEABILITY

Formation evaluation in liquid-dominated geothermal reservoirs [DOE/ET-28384/T1]
p0109 N82-12514

PETROLEUM PRODUCTS

Energy expenditure and dietary change [PB81-218471]
p0009 N82-10717

Models for forecasting energy use in the US farm sector [DE81-904220]
p0018 N82-12580

PHASE CHANGE MATERIALS

Performance of a cylindrical phase change thermal energy storage unit [AIAA PAPER 82-0076]
p0155 A82-17770

PHASE CONTROL

Performance analysis and simulation of the SPS reference phase control system
p0071 N82-12544

Design and breadboard evaluation of the SPS reference phase control system concept
p0072 N82-12545

Coherent multiple tone technique for ground based SPS phase control
p0147 N82-12546

An interferometer-based phase control system
p0147 N82-12547

A sonic satellite power system microwave power transmission simulator
p0147 N82-12548

SPS phase control studies
p0147 N82-12549

SPS fiber optic link assessment
p0147 N82-12550

PHASE TRANSFORMATIONS

Performance of a cylindrical phase change thermal energy storage unit [AIAA PAPER 82-0076]
p0155 A82-17770

Tertiary oil recovery processes research at the University of Texas [DE81-025222]
p0096 N82-10477

Liquid natural gas rapid phase transitions [PB81-244774]
p0118 N82-15232

PHENOLS

Thermolysis of naphthols [DE81-029684]
p0116 N82-15152

PHILOSOPHY

The nuclear controversy: Unequal competition in public policy-making [ERG-035]
p0027 N82-14626

PHOSPHINES

Impurity effects in a-Si:H solar cells [DE81-025069]
p0069 N82-11575

PHOSPHORIC ACID FUEL CELLS

The electric utility 4.5 MW fuel cell power plant - An urban demonstration
p0131 A82-15070

Fundamental investigations on fuel cells for transportation applications
p0137 N82-10493

Design considerations for vehicular fuel cell power plants [DE81-769737]
p0138 N82-10961

PHOTOACOUSTIC SPECTROSCOPY

Photoacoustic figure of merit for photothermal energy conversion efficiency
p0121 A82-10192

PHOTOCHEMICAL REACTIONS

Solar chemistry of metal complexes --- hydrogen production
p0058 A82-16124

Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry [DE81-027965]
p0023 N82-13192

PHOTOCONDUCTIVITY

A comparison of p-i-n and Schottky barrier hydrogenated amorphous silicon, a-Si:H, solar cells
p0070 A82-17649

PHOTODECOMPOSITION

Photocorrosion of strontium titanate photoanodes
p0057 A82-16056

PHOTOELECTRIC CELLS

Some characteristics of silicon photocells fabricated by planar technology
p0039 A82-10386

Electrical characteristics of high-voltage germanium photoconverters under high illumination intensities
p0040 A82-10391

Investigation of the possibility of using inexpensive concentrating systems in the modules of a photoelectric station
p0052 A82-13713

Production and certain properties of photoelectric cells based on silicon epitaxial structures
p0053 A82-13716

Amorphous boron-silicon-hydrogen alloys for thin-film heterojunction solar cells [DE81-027254]
p0068 N82-11558

PHOTOELECTRIC EMISSION

A practical method of analysis of the current-voltage characteristics of solar cells
p0051 A82-12823

PHOTOELECTRIC GENERATORS

Electrical characteristics of high-voltage germanium photoconverters under high illumination intensities
p0040 A82-10391

PHOTOELECTRICITY

Solar photovoltaic system engineering perspectives [DE81-023179]
p0066 N82-10570

PHOTOELECTROCHEMICAL DEVICES

Photoelectrochemical behaviour of CdS/NaI.3.3NH3 /liquid sodium iodide ammoniate/ junctions - Utilization in solar energy conversion
p0051 A82-12822

Investigation of the performance of an MoS2/I-/I2/C electrochemical solar cell
p0053 A82-13805

Sputtered thin film electrodes for photoelectrochemical cells
p0055 A82-15111

Current-voltage characteristics of semiconductor-electrolyte junction solar cells
p0055 A82-15112

Photoelectrochemical cells using polycrystalline and thin film MoS2 electrodes
p0057 A82-16053

The use of semiconducting oxide ceramics in solar energy conversion
p0059 A82-17099

Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer [DE81-030312]
p0081 N82-15569

PHOTOELECTROCHEMISTRY

Photoanode on the base of pheophytin-sensitized reactions
p0059 A82-16742

PHOTOIONIZATION
Infrared quenching of photocapacitance in Cu/x/S/CdS solar cells p0042 A82-11187
Photoanode on the base of pheophytin-sensitized reactions p0059 A82-16742

PHOTOLYSIS
Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry [DE81-027965] p0023 N82-13192

PHOTOOXIDATION
Photoanode on the base of pheophytin-sensitized reactions p0059 A82-16742

PHOTOSYNTHESIS
Response of the oceans to increasing atmospheric carbon dioxide [DE81-028178] p0025 N82-13558
Progress report to the Department of Energy in support of basic energy and policy research [DE81-025882] p0028 N82-14648

PHOTOTHERMAL CONVERSION
The optical properties-microstructure relationship in particulate media - Optical tailoring of solar absorbers p0037 A82-10011
The application of reversible chemical reactions to solar thermal energy systems p0038 A82-10020
Materials science issues encountered during the development of thermochemical concepts --- in screening of reactions for solar energy applications p0038 A82-10021
Photoacoustic figure of merit for photothermal energy conversion efficiency p0121 A82-10192
Optical properties of selectively absorbing chromium films deposited at oblique angle of incidence p0040 A82-10467
Spectrally selective copper sulphide coatings p0040 A82-10468
Development of a solar thermal central heat receiver using molten salt [ASME PAPER 81-SCL-2] p0041 A82-10970
Conceptual design of an advanced water/steam receiver for a solar thermal central power system [ASME PAPER 81-SCL-5] p0042 A82-10973
An evaluation of alternate system configurations for solar repowering electric power plants p0048 A82-11803
High-temperature solar central receivers p0052 A82-12949
Nickel sulphide-lead sulphide and nickel sulphide-cadmium sulphide selective coatings for solar thermal conversion p0059 A82-16745
Electric utility modeling extensions to evaluate solar plants p0061 A82-18025
A simplified model of the thermohydraulic behaviour of a linear collector network for the conversion of the solar energy p0062 A82-18816

PHOTOVOLTAIC CELLS
Introduction to photovoltaics - Physics, materials and technology p0038 A82-10022
Research and device problems in photovoltaics p0039 A82-10023
AAI Corporation receiver design experience in concentrating solar collectors [ASME PAPER 81-SCL-1] p0041 A82-10969
Design and testing of a uniformly illuminating nontracking concentrator p0042 A82-11209
Performance analysis of d.c.-motor-photovoltaic converter system. II - Series and shunt excited motors p0043 A82-11213
Cost and performance projections for SPS photovoltaic blankets p0045 A82-11741
Nonimaging concentrators for photovoltaic arrays in space p0046 A82-11761
Solar cell development for the Power Extension Package p0046 A82-11763
NASA preprototype redox storage system for u photovoltaic stand-alone application p0153 A82-11774
Photovoltaic system studies and developments p0049 A82-11804
Progress in large area photovoltaic devices based on amorphous silicon alloys p0049 A82-11855
Photovoltaics, the solar electric solution p0050 A82-12532
V2O5-Si photovoltaic cells p0051 A82-12824
Gallium-arsenic-antimony heterojunction photocells p0055 A82-14667
Silicon and gallium arsenide photovoltaic cells - Models for the functioning, experimentation, and application to concentrating collectors --- French thesis p0055 A82-15006
Investigations on a Se-CdO photovoltaic cell p0132 A82-16052
Low cost silicon-on-ceramic photovoltaic solar cells p0059 A82-17098
The El Paso electric 20-kilowatt photovoltaic system [AIAA PAPER 82-0064] p0060 A82-17761
The Mt. Laguna photovoltaic project [AIAA PAPER 82-0065] p0061 A82-17762
A photovoltaic system with energy storage - Natural Bridges National Monument 100-kW system [AIAA PAPER 82-0066] p0155 A82-17763
The Lea county electric 100-kilowatt grid-connected photovoltaic system [AIAA PAPER 82-0067] p0061 A82-17764
Performance of terrestrial photovoltaic modules at MIT Lincoln Laboratory experimental photovoltaic systems [DE81-029995] p0064 N82-10519
Intermediate photovoltaic-system application experiment operational performance report. Volume 1: For Lovington Square Shopping Center site, Lovington, New Mexico [DE81-028971] p0065 N82-10543
Electrochemical photovoltaic cells [DE81-769704] p0066 N82-10568
Mississippi County Community College solar photovoltaic project [DE81-030669] p0068 N82-11554
Zn3P2 as an improved semiconductor for photovoltaic solar cells [DE81-025587] p0069 N82-11577
Carlisle house: An all-solar electric residence [DOE/ET-20279/133] p0071 N82-11622
Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas [DE81-031934] p0072 N82-12602
Photovoltaic market analysis program: Background, model development, applications and extensions [DE81-029711] p0073 N82-12609
Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations [DE81-029700] p0073 N82-12610
Space applicable DOE photovoltaic technology: An update [NASA-CR-165021] p0076 N82-13491
Distributed photovoltaic systems: Utility interface issues and their present status [NASA-CR-165019] p0076 N82-13492
A Module Experimental Process System Development Unit (MEPSDU) [NASA-CR-165014] p0076 N82-13496
Intermediate photovoltaic system application experiment operational performance report. Volume 2 for Beverly High School, Beverly, Mass. [DE82-000811] p0077 N82-13532
Photovoltaic systems performance experience [DE81-025725] p0079 N82-14656
Solar Photovoltaic Residential Project. Project Integration Meeting, Agenda and Abstracts [DE81-028433] p0079 N82-14657
Solar power systems smaller than 500 W for military use [PEL-1980-06] p0080 N82-15534

PHOTOVOLTAIC CONVERSION
Introduction to basic aspects of plasma-deposited amorphous semiconductor alloys in photovoltaic conversion p0039 A82-10026
Present state of research on selective coatings for solar-energy converters p0039 A82-10387
A spacecraft thermophotovoltaic power source with thermal storage p0044 A82-11711
Thin cells - Their present status and future areas of development p0046 A82-11764
Power management of multi-hundred kilowatt spacecraft power systems p0046 A82-11769
Advances in photovoltaics R&D - An overview p0047 A82-11793
The development of high efficiency cascade solar cells - An overview p0047 A82-11794
Research activities of solar cells in ROC p0047 A82-11795
'Thin foil cells - A challenge for space array designers' p0049 A82-11842
Semiconductor converters/inverters for photovoltaic power supply p0126 A82-11857
A thermoelectric refrigerator powered by photovoltaic solar collectors p0049 A82-11858
Luminescent solar concentrators. II - Experimental and theoretical analysis of their possible efficiencies p0052 A82-13285
A study of the purification process during the elaboration by electron bombardment of polysilicon ribbons designed for photovoltaic conversion p0057 A82-16054
Influence of the junction area to edge area ratio on the open-circuit voltage of silicon solar cells p0058 A82-16133
Aplanatic double reflection system for thermophotovoltaic applications - Design p0060 A82-17293
Startup experience with a concentrating photovoltaic power system [AIAA PAPER 82-0068] p0061 A82-17765
Status of the microwave power transmission components for the solar power satellite p0146 A82-17982
Electric utility modeling extensions to evaluate solar plants p0061 A82-18025
Electrical properties of infrared photovoltaic Cd/x/Hg/1-x/Te detectors p0136 A82-18466
Market assessment of photovoltaic power systems for agricultural applications in Mexico [NASA-CR-165441] p0007 N82-10506
OESYS: A simulation tool for nonconventional energy applications analysis. Theoretical and operational description with user documentation [DE81-029701] p0007 N82-10514
Technical and economic assessment of solar thermophotovoltaic conversion [DE81-803762] p0064 N82-10515
Investigation of photovoltaic mechanisms in polycrystalline thin-film solar cells [DE81-027272] p0065 N82-10539
Study of photovoltaic cost elements. Volume 1: Executive report. Volume 2: Project background [DE81-030982] p0069 N82-11566
Study of photovoltaic cost elements. Volume 3: Sandia National Laboratories photovoltaic systems design catalog [DE81-030986] p0069 N82-11567
Study of photovoltaic cost elements. Volume 4: Installation cost model for residential PV systems: Users manual [DE81-031921] p0069 N82-11568
Study of photovoltaic cost elements. Volume 5: Installation cost model for intermediate PV systems: Users manual [DE81-030981] p0069 N82-11569
Photovoltaic mechanisms in polycrystalline thin film silicon solar cells [DE81-030370] p0072 N82-12608
Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles p0075 N82-12640
Data report for the Northeast residential experiment station, June 1981 --- photovoltaic systems [DE82-000068] p0077 N82-13533
Market assessment of photovoltaic power systems for agricultural applications in Morocco [NASA-CR-165477] p0077 N82-14627
Study of multi-megawatt technology needs for photovoltaic space power systems. Volume 1: Executive summary [NASA-CR-165323-VOL-1] p0078 N82-14636
Study of multi-megawatt technology needs for photovoltaic space power systems, volume 2 [NASA-CR-165323-VOL-2] p0078 N82-14637
Photovoltaic systems performance experience [DE81-025725] p0079 N82-14656
PHOTOVOLTAIC EFFECT
Testing and evaluation of a solar photovoltaic flywheel energy storage system [DOE/ET-20279/130] p0065 N82-10558
Solar photovoltaic system engineering perspectives [DE81-023179] p0066 N82-10570
National photovoltaic program in amorphous materials [DE81-025906] p0070 N82-11609
Solar Photovoltaic Residential Project. Project Integration Meeting, Agenda and Abstracts [DE81-028433] p0079 N82-14657
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries [PB81-231011] p0032 N82-15592
PHTHALOCYANIN
Low frequency capacitance characterizations on indium/x-phase of metal free phthalocyanine solar cells p0053 A82-13806
PHYSICS
Dimensions, volume 65, number 3 [PB81-235053] p0161 N82-15436
PILOT PLANTS
Proposed 12.5 MWe shelf-mounted OTEC pilot plant for power, water and mariculture at St. Croix [AIAA PAPER 81-2546] p0127 A82-14011
Proposed 10 MWe OTEC pilot plant for the Commonwealth of the Northern Mariana Islands [AIAA PAPER 81-2561] p0128 A82-14020
Florida's proposed OTEC pilot plant for Key West [AIAA PAPER 81-2563] p0003 A82-14021
Large wind turbine generator performance assessment, technology status report no. 3 [DE81-903763] p0137 N82-10524
Advanced system experimental facility: Solid waste to methane gas. Background and process description [DE81-030198] p0101 N82-11244
Solvent-Refined Coal-1 Demonstration Project. Final environmental impact statement, Volume 1 of 2 --- coal liquefaction plant at Newman, Kentucky [DE81-025983] p0010 N82-11252
Surface coal gasification [DE81-030183] p0102 N82-11253
Coal liquefaction demonstration plant near Morgantown, West Virginia; water assessment report section 13(b) [PB81-216095] p0103 N82-11269
Coal liquefaction demonstration plant near Morgantown, West Virginia: Water assessment report [PB81-216103] p0011 N82-11270
Industrial application of fluidized-bed combustion [DE81-030272] p0105 N82-12182
Solvent-Refined Coal (SRC) process [DE81-031937] p0106 N82-12197
Fixed-bed gasification [DE82-000432] p0108 N82-12261
Controlled-flash pyrolysis [DE82-000284] p0111 N82-13196
Low-Btu gasification of coal for electric power generation, phase 1, 2, and 3 [DE81-029402] p0112 N82-13248

Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] p0117 N82-15221
Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] p0117 N82-15222
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] p0080 N82-15530
Moorhead district heating, phase 2
[DE81-029689] p0031 N82-15556
Parallel evaluation of air-and oxygen-activated sludge
[PB81-246712] p0034 N82-15633

PINHOLES
A pinhole model for metal-insulator-semiconductor solar cells
p0056 A82-15442

PIPE FLOW
Controlled Retracting Injection Point (CRIP) system: A modified-stream method for in situ coal gasification
[DE81-026477] p0102 N82-11248
Cool-down flow-rate limits imposed by thermal stresses in LNG pipelines
[DE81-028731] p0150 N82-14484

PIPELINES
Cool-down flow-rate limits imposed by thermal stresses in LNG pipelines
[DE81-028731] p0150 N82-14484
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-130] p0150 N82-15134
Systems analysis of hydrogen/natural gas supplementation and separation
[DE81-021383] p0087 N82-15220

PIPES (TUBES)
Corrosion testing of carbon steel in aereated geothermal brine
[DE81-028653] p0093 N82-10201
Integrated function nonimaging concentrating collector tubes for solar thermal energy
[DE81-029677] p0064 N82-10521

PISTON ENGINES
Development free-piston Stirling test-bed engine
p0123 A82-11808
Modelling of the jet-stream Fluidyne
p0124 A82-11812

PITTING
Corrosion testing of carbon steel in aereated geothermal brine
[DE81-028653] p0093 N82-10201

PLANT DESIGN
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 1: Executive summary
[DE81-029440] p0155 N82-10527
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 2: Project design criteria: UPH
[DE81-028107] p0156 N82-10528
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 3: Project design criteria: CAES
[DE81-028197] p0156 N82-10546
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 12: Plant design, CAES
[DE81-028110] p0157 N82-10574
Alternative fuel for the steel industry of Northern Indiana: A prefeasibility study of a central coal gasification project
[DE81-029314] p0010 N82-11233
Feasibility and economic study of medium-BTU coal gas blended with high-BTU by product gas as an industrial energy source at Billings, Montana
[DE81-025166] p0101 N82-11237
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 8: Design approaches: UPH
[DE81-030673] p0158 N82-11620
Development, testing, and evaluation of MHD materials and component designs. Volume 1: Executive summary
[DE81-026203] p0139 N82-11947
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] p0140 N82-12446
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Conceptual Design Engineering Report (CDER). Volume 1: Executive summary
[NASA-CR-165452-VOL-1] p0140 N82-12570
Investigation and research of specific combustion-turbine and combined-cycle field problems
[DE81-904231] p0141 N82-12592
Low/medium Btu coal gasification assessment program for potential users in New Jersey: Executive summary
[DE81-025475] p0111 N82-13247
Low-Btu gasification of coal for electric power generation, phase 1, 2, and 3
[DE81-029482] p0112 N82-13248
Residual-energy-application program: EAST facility requirements document, volume 1
[DE81-027536] p0142 N82-13526
Feasibility study for an alcohol-fuels plant for Buffalo, New York
[DE82-000032] p0114 N82-14377

PLANT STRESS
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0030 N82-15488

PLANTS (BOTANY)
Geothermal environmental assessment: Behavior of selected geothermal brine contaminants in plants and soils
[PB81-222333] p0015 N82-11671
Biogeochemical evidence for subsurface hydrocarbon occurrence, recluse oil field, Wyoming: Preliminary results
[USGS-CIRC-837] p0110 N82-12693

PLASMA CHEMISTRY
Introduction to basic aspects of plasma-deposited amorphous semiconductor alloys in photovoltaic conversion
p0039 A82-10026

PLASMA CONDUCTIVITY
Study of the electric conductivity of plasma from fuel combustion products containing a weakly ionizing impurity
p0091 A82-12888

PLASMA CONTROL
Nonlinear development of magnetic reconnection in the tearing-type and the Petschek-type field geometries
p0132 A82-17015
Technology of controlled nuclear fusion
[DE81-027361] p0144 N82-15893

PLASMA CURRENTS
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design --- Engineering Test Facility
[AIAA PAPER 82-0325] p0135 A82-17889

PLASMA DYNAMICS
The plasmadynamics and ionization kinetics of thermionic energy conversion
p0137 N82-10094

PLASMA ELECTRODES
Impact of uniform electrode current distribution on ETF --- Engineering Test Facility MHD generator
[AIAA PAPER 82-0423] p0135 A82-17941

PLASMA EQUILIBRIUM
The tilting mode in field-reversed configurations --- stability of toroidal plasma equilibria
p0121 A82-11131

PLASMA GENERATORS
High pressure MHD coal combustors investigation, phase 2
[DE81-027238] p0138 N82-10888
RF-driven Tokamak reactor with sub-ignited, thermally stable operation
[DE81-029437] p0139 N82-11935

PLASMA HEATING
RF-driven Tokamak reactor with sub-ignited, thermally stable operation
[DE81-029437] p0139 N82-11935

PLASMA JETS
Introduction to basic aspects of plasma-deposited amorphous semiconductor alloys in photovoltaic conversion
p0039 A82-10026

PLASMA WAVES
Ionization waves in an argon discharge in a longitudinal gas flow
p0127 A82-12666
PLASMA-ELECTROMAGNETIC INTERACTION
Space chamber experiments of ohmic heating by high power microwave from the Solar Power Satellite
p0145 A82-16991
PLASTIC COATINGS
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[BMFT-FB-T-81-138] p0150 N82-15134
PLASTIC PROPERTIES
H-Coal product physical properties measurement
[DE81-029095] p0111 N82-13245
PLATE THEORY
Application of orthotropic plate theory to windmill blade design
p0121 A82-10978
PLUMES
Model calculations of the chemical processes occurring in the plume of a coal-fired power plant
p0005 A82-16342
Environmental effects of pollutants from coal combustion. 2: The Colstrip, Montana Power Plant
[PB81-234114] p0026 N82-13573
PLUTONIUM
Plutonium thermochemical solar cell
p0043 A82-11215
PLUTONIUM ISOTOPES
Space nuclear safety and fuels program
p0111 N82-12921
PLUTONIUM OXIDES
Space nuclear safety and fuels program
p0111 N82-12921
PNEUMATIC EQUIPMENT
Coal and limestone feed testing for atmospheric fluidized bed combustion
[DE81-030629] p0117 N82-15222
POINT SOURCES
Selected studies of four high-temperature air-pollution sources
p0015 N82-11680
POINTING CONTROL SYSTEMS
Simple tracking strategies for solar concentrations
p0042 A82-11207
POLITICS
Building a consensus about energy technologies
[DE82-000501] p0024 N82-13536
POLLUTION CONTROL
An overview of fluidized-bed combustion /FBC/ design practice
p0090 A82-11850
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] p0006 N82-10254
Oil and gas industry and environmental pollution: Application of systems reliability analysis for the evaluation of the status of environmental pollution control in the Nigerian petroleum industry
p0008 N82-10583
Environmental compliance program handbook
[DE81-030226] p0008 N82-10585
Study of the formation of submicron particulates generated by coal combustion
[DE81-027447] p0008 N82-10586
Coal gasifier parameters influencing environmental pollutant production
[PB81-221301] p0011 N82-11273
An evaluation of three-way control single and dual bed catalysts as applied to heavy-duty gasoline engines
[PB81-224982] p0012 N82-11477
Intergrated assessment for energy-related environmental standards: A summary of issues and findings
[DE81-028552] p0014 N82-11646
Sulfur pollution control. Phase 1: The disposal program
[PB81-222612] p0014 N82-11652
Control of utility boiler and gas turbine pollutant emissions by combustion modification, phase 2
[PB81-222267] p0015 N82-11654
Sulfur pollution control. Phase 1: The disposal program (sections 5 through 7)
[PB81-222804] p0015 N82-11655
Vapor-phase cracking and wet oxidation as potential pollutant control techniques for coal gasification
[PB81-219594] p0015 N82-11661
EPA utility FGD (Flue Gas Desulfurization) survey
[PB81-225773] p0015 N82-11679
FGDIS primer: Major equipment/component classifications, problem/solution access codes, and definitions related to FGD systems as contained in the Flue Gas Desulfurization Information System (FGDIS)
[PB81-225948] p0016 N82-11985
Fixed-bed gasification
[DE82-000432] p0100 N82-12261
Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-028930] p0021 N82-12675
Sulfur in the air in the capital (Helsinki) metropolitan area: ITASAT-project
[RR-614.71] p0025 N82-13553
Environmental hazard rankings of pollutants generated in coal gasification processes
[PB81-231698] p0026 N82-13576
Sampling and analysis of potential geothermal sites
[PB81-240061] p0119 N82-15593
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] p0033 N82-15607
Real time coarse particle mass measurements in a high temperature and pressure coal gasifier process treatment
[DE81-030036] p0033 N82-15609
Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] p0034 N82-15623
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] p0035 N82-15651
POLLUTION MONITORING
Fingerprinting pollutant discharges from synfuels plants
p0001 A82-10697
Rate coefficients of combustion/fuel conversion reactions by high-temperature photochemistry
[DE81-027965] p0023 N82-13192
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0030 N82-15488
POLLUTION TRANSPORT
Chemical and geochemical studies off the coast of Washington
[DE81-030319] p0017 N82-12513
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] p0032 N82-15602
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] p0033 N82-15610
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] p0033 N82-15613
POLYCRYSTALS
Advances in photovoltaics R&D - An overview
p0047 A82-11793
Grain size dependence of the photovoltaic properties of solar grade polysilicon
p0057 A82-16051
Photoelectrochemical cells using polycrystalline and thin film MoS2 electrodes
p0057 A82-16053
A study of the purification process during the elaboration by electron bombardment of polysilicon ribbons designed for photovoltaic conversion
p0057 A82-16054

High efficiency inversion layer solar cells on polycrystalline silicon by the application of silicon nitride
p0058 A82-16127
A method for experimental assessment of the shifting approximation, with application to polysilicon solar cells --- effect of constant series resistance
p0058 A82-16131
Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 A82-10490
Investigation of photovoltaic mechanisms in polycrystalline thin-film solar cells
[DE81-027272] p0065 N82-10539
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] p0081 N82-15569

POLYMERS
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523

POLYNUCLEAR ORGANIC COMPOUNDS
Identification and toxicity of fractionated-shale-oil components
[DE81-028460] p0021 N82-12766

POROUS MATERIALS
Mechanically stable hydride composites designed for rapid cycling
p0084 A82-16347

POTASSIUM
Mass spectrometric studies of MHD slag thermochemistry
[PB81-221434] p0138 N82-11173
Laboratory study for removal of organic sulfur from coal
[DE81-025132] p0010 N82-11239

POTASSIUM HYDROXIDES
Fundamental investigations on fuel cells for transportation applications
p0137 N82-10493

POTATOES
Methane production from alkaline food waste
p0092 N82-10115

POWDER (PARTICLES)
Elemental composition of atmospheric fine-particles emitted from coal burned in a modern electric power plant equipped with a flue-gas desulfurization system
[DE81-030073] p0033 N82-15610
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] p0033 N82-15613

POWER CONDITIONING
High power solar array switching regulation
p0045 A82-11736
Series vs. shunt regulators for power control in satellite power systems
p0045 A82-11738
Satellite power systems /SPS/ energy conversion and power management
p0045 A82-11742
Advances in space power research and technology at the National Aeronautics and Space Administration
p0122 A82-11755
Power management of multi-hundred kilowatt spacecraft power systems
p0046 A82-11769
The evaluation of four solar-array-powered multi-kW power conditioners for Space Shuttle Orbiter application
p0046 A82-11772
Control of new energy sources in an electric utility system
p0154 A82-13082
Workshop on Microwave Power Transmission and Reception. Workshop paper summaries
[NASA-TM-84064] p0146 N82-12538
Satellite power system: Concept development and evaluation program. Volume 4: Energy conversion and power management
[NASA-TM-58237-VOL-4] p0078 N82-14634

POWER EFFICIENCY
Introduction to photovoltaics - Physics, materials and technology
p0038 A82-10022
Analysis of power, mass, and size parameters of solar vapor-turbine two-circuit systems with organic working bodies
p0044 A82-11421
Small sodium sulfur battery for solar and wind energy systems
p0047 A82-11770
Design considerations for a 1500 M head 300-600 MW double stage reversible pump/turbine with regulation
p0154 A82-11782
Characteristics of CVD silicon carbide thermionic converters
p0124 A82-11821
Increasing power and efficiency by dynamic suppression of ionization instability in a plasma
p0127 A82-12097
A design for an MHD power plant as a prime mover for a Naval Vessel
[AIAA PAPER 81-2575] p0129 A82-14032
Problems and potential for MHD retrofit of existing coal-fired plants
[AIAA PAPER 81-2586] p0130 A82-14036
On the efficiency of thermal engines with power output - Harmonically driven engines
p0131 A82-14409
Energy potential and early operational experience for large wind turbines
p0132 A82-17627
Evaluation of wind turbine generator operational hysteresis using 'Method of Bins'
p0133 A82-17636
Liquid-metal MHD for solar and coal
[DE81-023545] p0137 N82-10553
Intermediate photovoltaic system application experiment operational performance report. Volume 2 for Beverly High School, Beverly, Mass.
[DE82-000811] p0077 N82-13532
Comparative analyses of space-to-space central power stations
[NASA-TP-1955] p0150 N82-14202

POWER LINES
Cryogenic testing of 100-m superconducting power transmission test facility
[DE81-028331] p0150 N82-13517
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] p0150 N82-15338

POWER SUPPLIES
Alternate hybrid power sources for remote site applications
[AD-A099471] p0024 N82-13512

POWER SUPPLY CIRCUITS
Loading schemes for a 50 MW/th/ diagonally connected MHD generator
[AIAA PAPER 82-0395] p0135 A82-17923

PRECIPITATION (CHEMISTRY)
Aluminum recovery from fly ash and shale-retort wastes
[DE81-027675] p0099 N82-11154

PREDICTION ANALYSIS TECHNIQUES
Projecting regional potentials for cost-effective energy conservation and renewable resource applications: A feasibility study
[DOE/CS-10045/T3] p0027 N82-14645
Regional load-curve models: Scenario and forecast using the DRI model
[DE81-904192] p0033 N82-15605

PRESIDENTIAL REPORTS
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] p0035 N82-16022

PRESSURE VESSEL DESIGN
Novel design of pressure vessels and thermal shields in coal gasifiers
[DE81-025828] p0104 N82-11474

PRESSURE VESSELS
Novel design of pressure vessels and thermal shields in coal gasifiers
[DE81-025828] p0104 N82-11474

PRESSURIZING
Relaxation of geothermal-reservoir stresses induced by heat production
[DE81-032024] p0105 N82-11715

PRETREATMENT
Partial acid hydrolysis pretreatment for enzymatic hydrolysis of cellulose: A process development study of ethanol production
p0107 N82-12236
PROBLEM SOLVING
Case studies in the application of air quality modelling in environmental decision making: Summary and recommendations
[PB81-213233] p0009 N82-10605
Soviet UCG experience specifically related to field experiments in the United States
[DE81-028642] p0111 N82-13244
PROCESS CONTROL (INDUSTRY)
High-mass-flux coal gasifier
[DE81-029807] p0094 N82-10257
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626
PROCESS HEAT
Application of HTGR process heat to oil shale retorting
p0090 A82-11851
Design, cost and performance comparisons of several solar thermal systems for process heat. Volume 1: Executive summary
[DE81-029881] p0069 N82-11576
Residual-energy-applications program: EAST-facility requirements document
[DE81-027489] p0014 N82-11616
Guidebook for solar process-heat applications
[DE81-027977] p0072 N82-12598
Comparative economics of solar thermal central receivers
[DE81-029623] p0072 N82-12601
Status of solar energy research and development in Australia
[NP-1903916] p0073 N82-12611
Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029611] p0073 N82-12618
Fuels and chemicals made from solar energy
[DE81-025018] p0077 N82-14384
SERI Solar-Energy-Storage Program
[DE81-029476] p0082 N82-15576
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] p0119 N82-15604
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626
PRODUCT DEVELOPMENT
Florida's proposed OTEC pilot plant for Key West
[AIAA PAPER 81-2563] p0003 A82-14021
DOE solar-assisted heat-pump program: Its evolution and its potential
[DE81-026055] p0067 N82-11413
Solar cell development for the power extension package
[NASA-TM-82685] p0068 N82-11551
High efficient collector for small solar-powered facilities
[DRFT-FB-T-81-156] p0080 N82-15538
PRODUCTION COSTS
Agricultural policies and biomass fuels
p0001 A82-11542
Small-scale uses and costs of hydrogen derived from OTEC ammonia
p0084 A82-11792
Assessment of potential future markets for the production of hydrogen from water
[DRFT-FB-T-81-012] p0086 N82-12266
PRODUCTION ENGINEERING
Effects of processing parameters on thick film inks used for solar cell front metallization
p0058 A82-16474
Soviet UCG experience specifically related to field experiments in the United States
[DE81-028642] p0111 N82-13244
A Module Experimental Process System Development Unit (MEPSDU)
[NASA-CR-165014] p0076 N82-13496
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523
Potential contribution of currently operating nuclear-fueled electric-generating units to reducing US oil consumption
[DE81-030497] p0031 N82-15553
PROJECT MANAGEMENT
Application of large and small wind turbine generators - A utility perspective
p0133 A82-17629
Overview of the Wind Energy Application Network for Hawaii
p0133 A82-17634
Quarterly report of solar federal buildings program in the MASEC region
[DE81-027968] p0062 N82-10276
Project impact analysis as an optimal control problem --- irrigation and hydroelectric power project
[DE81-028465] p0021 N82-12842
Natural gas plan needed to provide greater protection for high-priority and critical uses
[PB81-228488] p0023 N82-13255
PROJECT PLANNING
Project demonstration of wind-turbine electricity: Interconnecting a northern Michigan fruit farm with a major utility
[DE81-030950] p0138 N82-11380
DOE solar-assisted heat-pump program: Its evolution and its potential
[DE81-026055] p0067 N82-11413
Planning a comprehensive program for exploration of the anthracite deposits of the Narragansett Basin of Massachusetts and Rhode Island, phase 1 and 2
[DE81-028490] p0104 N82-11519
Great Plains gasification project, Mercer County, North Dakota; water assessment report section 13(c)
[PB81-216111] p0013 N82-11524
Great Plains gasification project, Mercer County, North Dakota; water assessment report
[PB81-216129] p0013 N82-11525
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] p0107 N82-12250
LLNL 1981: Technical horizons
[DE81-028265] p0026 N82-14048
Analysis of the energy impacts of the DOE Appropriate Energy Technology Small Grants Program: Method and results
[DE81-029844] p0028 N82-14651
Application of an LP model to strategic planning of multinational cooperative RD and D programs
[DE81-029325] p0035 N82-16014
PROJECTS
Department of Energy projects
[DE82-000038] p0018 N82-12579
PROPULSION SYSTEM PERFORMANCE
Assessment of flywheel system benefits in selected vehicle applications
[DE81-025976] p0158 N82-11997
PROPULSIVE EFFICIENCY
Assessment of I.C. engines as drivers for heat actuated heat pumps
[DE81-024086] p0139 N82-11421
PROTECTIVE COATINGS
Characteristics of CVD silicon carbide thermionic converters
p0124 A82-11821
Lightning protection for composite rotor blades --- of windpowered turbines
p0133 A82-17631
Selection and testing of suitable coating systems for steel pipes used for long distance heat transfer
[DRFT-FB-T-81-138] p0150 N82-15134
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] p0081 N82-15569
PROTON IRRADIATION
Effects of low temperature periodic annealing on the deep-level defects in 200 keV proton irradiated AlGaAs-GaAs solar cells
p0061 A82-18287

PROTOTYPES
Development of a prototype of a 10 kW small solar power plant --- technology for developing nations
[SERI-PR-2-01-101] p0080 N82-15532
PSYCHOACOUSTICS
Establishment of noise acceptance criteria for wind turbines
p0125 A82-11825
PULSE CHARGING
Effect of positive pulse charge waveforms on the energy efficiency of lead-acid traction cells
[NASA-TM-82709] p0155 N82-10503
PULSE GENERATORS
Techniques and applications of pulsed power technology
p0153 A82-11722
Pulsed Power Research colloquium
[AD-A105770] p0150 N82-14638
PURIFICATION
A study of the purification process during the elaboration by electron bombardment of polysilicon ribbons designed for photovoltaic conversion
p0057 A82-16054
PYROELECTRICITY
Regenerative pyroelectric heat engine
p0126 A82-11833
PYROLYSIS
Production of synthetic crude oil from coal using the TOSCOAL pyrolysis process
p0090 A82-11849
Application of HTGR process heat to oil shale retorting
p0090 A82-11851
Synthetic-fuel combustion; pollutant formation. Soot-initiation mechanisms in burning aromatics
[DE81-029480] p0093 N82-10155
Kinetics and catalysis of producing synthetic gases from biomass
[PB81-217614] p0095 N82-10272
Surface coal gasification
[DE81-030183] p0102 N82-11253
Pyrolysis of coal-drived fuels using the laser-powered homogeneous pyrolysis technique
[DE82-000251] p0106 N82-12196
Controlled-flash pyrolysis
[DE82-000284] p0111 N82-13196
Solar-central-receiver fuels and chemicals
[DE82-000941] p0077 N82-13530
Pyrolytic characterization of the organic matter in selected coals and in the Devonian shales of southern West Virginia
p0113 N82-13578

Q

QUALITY CONTROL
Standards application and development plan for solar thermal technologies
[DE81-030310] p0065 N82-10534
QUANTITATIVE ANALYSIS
Vaporization and chemical transport under coal gasification conditions
[PB81-245839] p0117 N82-15165
QUANTUM EFFICIENCY
Carrier-collection efficiencies in amorphous hydrogenated silicon Schottky-barrier solar cells
p0042 A82-11185
The development of high efficiency cascade solar cells - An overview
p0047 A82-11794
ZnO - p-InP heterojunction solar cells
p0051 A82-12821
Thin-film gallium arsenide homojunction solar cells
p0052 A82-13200
QUENCHING (ATOMIC PHYSICS)
Infrared quenching of photocapacitance in Cu/x/S/CdS solar cells
p0042 A82-11187
QUINOLINE
Enthalpy measurement of coal-derived liquids
[DE81-029481] p0097 N82-10939

R

RADIANT FLUX DENSITY
Ionospheric power beam studies
p0147 N82-12542
RADIANT HEATING
High thermal power density heat transfer --- thermionic converters
[NASA-CASE-LEW-12950-1] p0139 N82-11399
Magnetohydrodynamic research program of the MHD Energy center at Mississippi State University and structural features of MHD radiant boilers
[DE81-029901] p0139 N82-11934
RADIATION CHEMISTRY
Solar chemistry of metal complexes --- hydrogen production
p0058 A82-16124
RADIATION DAMAGE
Solar cell development for the power extension package
[NASA-TM-82685] p0068 N82-11551
RADIATION DISTRIBUTION
Focal plane flux distributions produced by solar concentrating reflectors
p0043 A82-11211
RADIATION EFFECTS
Chronic exposure of a honey bee colony to 2.45 GHz continuous wave microwaves
p0003 A82-14347
RADIATION HARDENING
GaAs solar cells for space application
p0046 A82-11766
RADIATION HAZARDS
Environmental and radiological safety studies: Interaction of (238) PuO2 heat sources with terrestrial and aquatic environments
[DE81-032019] p0025 N82-13565
Comparison of potential radiological consequences from a spent-fuel repository versus natural-uranium deposits
[DE81-028232] p0029 N82-14910
RADIATION PROTECTION
Overview of the biomedical and environmental programs at the Oak Ridge National Laboratory
[DE81-027864] p0021 N82-12765
RADIATIVE HEAT TRANSFER
The emissivity of metals --- frequency and temperature dependence calculations for solar collector design
p0038 A82-10014
Correlation between results of zone method and experiment in radiative heat transfer
[ASME PAPER 81-HT-71] p0121 A82-10958
Calculation of the top loss coefficient by the network method and applications to solar collectors
p0056 A82-15653
RADIO FREQUENCY HEATING
RF-driven Tokamak reactor with sub-ignited, thermally stable operation
[DE81-029437] p0139 N82-11935
RADIO RECEPTION
Solar power satellite microwave power transmission and reception system
p0145 A82-11703
RADIOACTIVE ISOTOPES
Engineering development testing of the GPHS-RTG converter --- General Purpose Heat Source-Radioisotope Thermoelectric Generator for Galileo orbiter power supply
p0122 A82-11752
RADIOACTIVE WASTES
Low-level radioactive waste: An introductory overview
[DE81-026334] p0022 N82-12924
Comparison of potential radiological consequences from a spent-fuel repository versus natural-uranium deposits
[DE81-028232] p0029 N82-14910
RADIOISOTOPE BATTERIES
Modular isotopic thermoelectric generator
p0122 A82-11753
Nuclear electric power for space systems - Technology background and flight systems program
p0123 A82-11756
RAIL TRANSPORTATION
Controlled velocity testing of small wind energy conversion systems - An evaluation of a technique
p0134 A82-17642
Evaluation of novel underground transport systems
[DE81-030279] p0146 N82-12520
Environmental impacts of energy transportation
[DE82-900316] p0025 N82-13559

RAILGUN ACCELERATORS
Possible application of electromagnetic guns to impact fusion
p0135 A82-18201

RAIN EROSION
A review of rain erosion problems for aerogenerators
p0130 A82-14356

RAIN IMPACT DAMAGE
A review of rain erosion problems for aerogenerators
p0130 A82-14356

RANKINE CYCLE
The economic implications of the exergy and thermal efficiencies of energy conversion systems
p0121 A82-11702
Development of a solar receiver for an organic Rankine cycle engine
p0048 A82-11800
Organic fluids for the practical use in energy conversion systems of solar power plants
[SERI-PR-T-81-154] p0080 N82-15537
Overview of active solar absorption/Rankine cooling program
[DE81-028041] p0082 N82-15577

RATINGS
Performance testing and rating standards for Wind Energy Conversion Systems
p0135 A82-17646

REACTION KINETICS
Hydrogen generation by means of catalyzed Hg-Al hydrolysis
p0083 A82-10398
Improved efficiency in the sulfur dioxide - Iodine hydrogen cycle through the use of magnesium oxide
p0083 A82-11784
Parametric study of the cadmium thermoelectrochemical hydrogen cycle
p0083 A82-11785
The corrosion of some superalloys in contact with coal chars in coal gasifier atmospheres
p0091 A82-17974
Design of a cell for electrode kinetic investigations of fuel cell reactions
p0136 A82-18394
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[DE81-023581] p0092 N82-10144
Synthetic-fuel combustion; pollutant formation. Soot-initiation mechanisms in burning aromatics
[DE81-029480] p0093 N82-10155
Pulverized-fuel combustion: Modeling and scaleup methodologies
[DE81-026546] p0093 N82-10158
Selectivity in Fischer-Tropsch synthesis: Review and recommendations for further work
[PB81-223596] p0095 N82-10271
Kinetics and catalysis of producing synthetic gases from biomass
[PB81-217614] p0095 N82-10272
Laboratory study for removal of organic sulfur from coal
[DE81-025132] p0010 N82-11239
Kinetics of NO/ sub x formation during early stages of pulverized-coal combustion
[DE81-029071] p0014 N82-11641
Solid-solid reactions in coal conversion processes
p0107 N82-12238
Development of hydroconversion of biomass to synthetic fuels
[DE81-030954] p0108 N82-12260
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] p0021 N82-12674
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] p0033 N82-15607

REACTION PRODUCTS
Solid-solid reactions in coal conversion processes
p0107 N82-12238
Process for removing sulfur oxides from gases with direct production of a usable finished reaction product --- ammonium sulfate fertilizer
[SERI-PR-T-81-102] p0029 N82-15142

REACTOR CORES
Development of space reactor core heat pipes
p0122 A82-11747

REACTOR DESIGN
A compact, efficient thermoelectric module for a space reactor
p0122 A82-11749
Nuclear reactor closed Brayton cycle space power conversion systems
p0126 A82-11840
An overview of peat gasification
p0089 A82-11848
Possible application of electromagnetic guns to impact fusion
p0135 A82-18201
Particulate processes in pulverized-coal flames
[DE81-025153] p0093 N82-10157
H-coal process improvement study. Bench unit baseline run with preheater/reactor
[DE81-026022] p0094 N82-10260
Advanced-gasification processes
[DE81-030184] p0102 N82-11254
Engineering challenges of fusion-reactor development
[DE81-024129] p0139 N82-11907

REACTOR MATERIALS
Materials science issues encountered during the development of thermochemical concepts --- in screening of reactions for solar energy applications
p0038 A82-10021
Advanced high temperature thermoelectrics for space power
p0125 A82-11823
Technology of controlled nuclear fusion
[DE81-027361] p0144 N82-15893

REAL TIME OPERATION
Real-time coarse-particle mass measurements in a high-temperature/pressure coal-gasifier process treatment
[DE81-030039] p0119 N82-15604

RECEIVERS
Technological activities for high performance receivers --- for solar thermal power plants
[SERI-PR-T-80-133] p0066 N82-10571

RECHARGING
Rechargeable metallic hydrides for hydrogen storage
p0085 A82-17150
Rechargeable molten-salt cells
[DE81-027091] p0158 N82-11595
Energy storage systems for terrestrial solar generators --- cadmium/mercury oxide cells
[SERI-PR-T-81-082] p0080 N82-15529

RECTANGULAR PLATES
Optimization of flow passage geometry for air-heating, plate-type solar collectors
p0055 A82-14846

RECTENNAS
Design and breadboard evaluation of the SPS reference phase control system concept
p0072 N82-12545
The history of the development of the rectenna
p0149 N82-12560
Rectenna system design
p0149 N82-12561
Rectenna session: Micro aspects
p0149 N82-12562
A theoretical study of microwave beam absorption by a rectenna
p0149 N82-12563
Rectenna array measurement results
p0149 N82-12564
Session on solid state: Introduction
p0149 N82-12565
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite
p0149 N82-12568

RECTIFICATION
Thermoelectric conversions based on noise rectification
p0138 N82-10936

RECYCLING
SOL-CYCLE: A solar-assisted solvent-recycling process for asphalt-impregnation of fiber board
[DE81-903377] p0070 N82-11615
Construction of a recycled Portland cement concrete pavement --- Connecticut expressway
[PB81-233553] p0023 N82-13267

REDOX CELLS
Performance of advanced chromium electrodes for the NASA Redox Energy Storage System
[NASA-TM-82724] p0159 N82-12574

REDUCTION (CHEMISTRY)
Development of a process for recovery of valuable components from complex hydrodesulfurization catalysts especially tungsten, molybdenum, vanadium, nickel and cobalt
[BMFT-FB-T-80-186] p0016 N82-12204
Thermochemical production of liquids from biomass
[DE81-030085] p0117 N82-15226
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] p0033 N82-15607
REFINING
Sulfur pollution control. Phase 1: The disposal program (sections 5 through 7)
[PB81-222804] p0015 N82-11655
Solvent-Refined Coal (SRC) process
[DE81-031937] p0106 N82-12197
Feasibility study report for the Imperial Valley Ethanol Refinery: A 14.9-million-gallon-per-year ethanol synfuel refinery utilizing geothermal energy
[DE82-000288] p0112 N82-13252
REFLECTANCE
Investigation of abrasive action of atmospheric particles on the reflectance of mirrors
p0040 A82-10368
Efficiency of Fresnel lenses
p0043 A82-11387
Optimization of heat losses in normal and reverse flat-plate collector configurations - Analysis and performance
p0059 A82-16744
REFLECTORS
Contributions of space reflector technology to food production, local weather manipulation and energy supply, 1985-2020
p0054 A82-14445
REFRACTORY MATERIALS
Energy and ceramics --- Book
p0005 A82-17076
Materials technology for coal-conversion processes
[DE81-028474] p0100 N82-11169
REFRIGERANTS
A novel latent heat storage for solar space heating systems - Refrigerant storage
p0043 A82-11386
REFRIGERATING
Design and development of a reciprocating low-temperature freon expander
[DE81-028609] p0023 N82-13392
REFRIGERATING MACHINERY
Method for calculating the unsteady temperature conditions of the generator in a solar refrigeration system
p0056 A82-15642
Design and development of a reciprocating low-temperature freon expander
[DE81-028609] p0023 N82-13392
REFRIGERATORS
A thermoelectric refrigerator powered by photovoltaic solar collectors
p0049 A82-11858
Appliance efficiency and the solar building
[DE81-029073] p0075 N82-13265
REGENERATION (ENGINEERING)
Regenerative pyroelectric heat engine
p0126 A82-11833
Industrial applications of MHD high temperature air heater technology
[AIAA PAPER 81-2588] p0130 A82-14037
High-temperature counter-flow recuperator
[DE81-031923] p0017 N82-12424
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] p0019 N82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study
[DE81-904236] p0019 N82-12594
REGENERATIVE FUEL CELLS
Development status of a regenerative fuel cell system for orbital operation
p0153 A82-11707
REGENERATORS
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] p0030 N82-15367
REGIONAL PLANNING
National coal-market conditions for the year 2000: Regional-issue identification and analysis, high scenario
[DE81-026425] p0016 N82-11988
Projecting regional potentials for cost-effective energy conservation and renewable resource applications: A feasibility study
[DOE/CS-10045/T3] p0027 N82-14645
Energy and development in Central America. Volume 1: Regional assessment
[PB81-231540] p0032 N82-15589
REGULATIONS
Montana geothermal handbook: A guide to agencies, regulations, permits and financial aids for geothermal development
[DE81-024315] p0007 N82-10562
Environmental compliance program handbook
[DE81-030226] p0008 N82-10585
Methodology for determining the impact of environmental regulatory programs
[DE81-903429] p0009 N82-10594
Relaxing environmental standards during oil-supply disruptions: Past, present and future
[DE81-024250] p0009 N82-10601
Photovoltaic market analysis program: Background, model development, applications and extensions
[DE81-029711] p0073 N82-12609
Millions wasted trying to develop major energy information system
[AFMD-81-40] p0029 N82-14959
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] p0035 N82-15652
REINFORCED SHELLS
Optimum reinforcement shapes and paths for rotating composite shells
p0154 A82-14513
REINFORCING MATERIALS
Conceptual design of a glass-reinforced concrete solar collector
[DE81-029280] p0065 N82-10542
RELIABILITY
Project for reliability fleet testing of alcohol/gasoline blends
[DE82-000004] p0107 N82-12250
RELIABILITY ANALYSIS
Incorporation and impact of a wind energy conversion system in generation expansion planning
p0004 A82-15068
Enertech High Reliability prototype vibration analysis
p0133 A82-17635
Development of high-performance, high-reliability windpower generators
p0134 A82-17640
Photovoltaic systems performance experience
[DE81-025725] p0079 N82-14656
RELIABILITY ENGINEERING
Distributed photovoltaic systems: Utility interface issues and their present status
[NASA-CR-165019] p0076 N82-13492
REMOVAL
Separation of particles from coal derived liquids via surface charge properties
[DE81-029088] p0092 N82-10161
RESEARCH
Key contributions in MHD power generation
[DE81-028121] p0138 N82-10882
Ames Laboratory research report, 1980
[DE81-027399] p0161 N82-11012
RESEARCH AND DEVELOPMENT
Solar energy technology - A five-year update
p0044 A82-11541
Factors in the development of a major US synthetic fuels industry
p0001 A82-11543
Advances in space power research and technology at the National Aeronautics and Space Administration
p0122 A82-11755
Gallium arsenide solar cells-status and prospects for use in space
p0046 A82-11765
Advances in photovoltaics R&D - An overview
p0047 A82-11793
Research activities of solar cells in ROC
p0047 A82-11795

Overview of DOE's large stationary Stirling engine development program
p0123 A82-11805
High-temperature solar central receivers
p0052 A82-12949
Solar perspectives - Israel, solar pond innovator
p0052 A82-12950
An estimate of OTEC costs, market potential and proof-of-concept vessel financing
[AIAA PAPER 81-2567] p0003 A82-14024
OTEC ocean system development
[AIAA PAPER 81-2590] p0130 A82-14038
Renewables in the U.S. energy future - How much, how fast
p0003 A82-14404
One viewpoint concerning unit size in the development of wind turbines
p0131 A82-14845
Research opportunities in new energy-related materials
p0161 A82-15377
Cooperative program of applied energy research technology development
[DE81-028916] p0007 N82-10517
LLNL 1981: Technical horizons
[DE81-026265] p0026 N82-14048
Evaluating R and D options under uncertainty. Volume 3: An electric-utility generation-expansion planning model
[DE81-904237] p0035 N82-16013
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] p0035 N82-16022

RESEARCH FACILITIES
Dimensions, volume 65, number 3
[PB81-235053] p0161 N82-15436

RESEARCH MANAGEMENT
Environmental research plan for gas supply technologies. Volume 2: Environmental research plan
[PB81-222317] p0011 N82-11274
Pulsed Power Research colloquium
[AD-A105770] p0150 N82-14638

RESEARCH PROJECTS
Research activities of solar cells in ROC
p0047 A82-11795

RESERVOIRS
Planning an underground pumped hydro project for the Commonwealth Edison Company
p0154 A82-11847
Development of man-made geothermal reservoirs --- extracting heat from hot dry rock
[LA-UR-81-852] p0097 N82-10480
Feasibility of a small scale pumped storage demonstration project, Hibbing, Minnesota
[DE81-026678] p0155 N82-10525
Hot dry rock geothermal energy development program
[LA-UR-81-1265] p0097 N82-10560
Formation evaluation in liquid-dominated geothermal reservoirs
[DOE/ET-28384/T1] p0109 N82-12514
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] p0109 N82-12518
Reservoir stability studies
[DE81-030099] p0160 N82-15510

RESIDENTIAL ENERGY
Alternative power sources for residential air-conditioning systems
p0039 A82-10331
Net energy analysis of small wind energy conversion systems
p0121 A82-11389
A simplified method for direct calculation of the annual load fraction of solar systems for space heating
p0054 A82-14405
A solar heating system with annual storage
p0056 A82-15666
Wind energy and the Nation's rural electric systems
p0091 A82-17645
Earth shelter 2. 1979-1980 USC series
[CONF-800438] p0006 N82-10277
Solar project description for living systems single family residence, Davis, California
[DE81-029743] p0064 N82-10511
Summary of passive-solar-retrofit workshops
[DE81-028146] p0065 N82-10547

Annual cycle energy system
[DE81-024911] p0007 N82-10552
Preliminary investigation on a primary energy saving heat supply system for the residential district "Maria Lindenhof" in Dorsten, West Germany --- using river water as a heat source and systems engineering
[BMFT-FB-T-80-157] p0008 N82-10572
Sampling design for the 1980 commercial and multifamily residential building survey
[DE81-028783] p0011 N82-11320
User needs for solar decision-making tools: The homebuilding industry
[DE81-027293] p0067 N82-11325
Well-water-source heat pump field performance study
[DE81-024136] p0012 N82-11419
Solar energy system performance evaluation: Forest City Dillon, Washington, D.C., January 1980 - December 1980
[DE81-028174] p0068 N82-11560
Solar energy system performance evaluation: Montecito Pines, Santa Rosa, California, November 1979 - April 1980
[DE81-028175] p0068 N82-11561
Study of photovoltaic cost elements. Volume 4: Installation cost model for residential PV systems: Users manual
[DE81-031921] p0069 N82-11568
SOLPLAN report: An assessment of barriers and incentives to conservation and alternative-energy use in the residential sector in Wisconsin
[DOE/CS-30292/3] p0013 N82-11614
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures
[DE82-900206] p0017 N82-12278
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] p0071 N82-12279
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems
[DE82-900208] p0071 N82-12280
Comparison of residential window distributions and effects of mass and insulation
[DE81-027938] p0017 N82-12283
Assessment of the potential of coal-fueled heat engines in total and integrated energy systems
[DE82-000169] p0018 N82-12587
Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations
[DE81-029700] p0073 N82-12610
Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study
[DE81-028402] p0074 N82-12630
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] p0020 N82-12641
Ultimate in building energy analysis: DOE-2 and BLAST
[DE81-028703] p0023 N82-13263
Appliance efficiency and the solar building
[DE81-029073] p0075 N82-13265
Annual cycle energy system experimental performance and national applicability
[DE81-028570] p0024 N82-13523
Data report for the northeast residential experiment station, June 1981 --- photovoltaic systems
[DE82-000068] p0077 N82-13533
Coal-oil mixtures: An alternative fuel for the commercial markets and large residential markets
[DE81-028335] p0114 N82-14379
Biomass energy utilization in the Pacific Northwest: Impacts associated with residential use of solid fuels
[DE81-029137] p0115 N82-14383
Residential site design and energy conservation. Part 1: General report
[DE81-904010] p0027 N82-14398
Design of an energy conservation building
[NASA-TM-83175] p0027 N82-14632

Solar Photovoltaic Residential Project. Project Integration Meeting, Agenda and Abstracts
[DE81-028433] p0079 N82-14657
Potential energy savings in the residential sector of the United States
[DE81-028873] p0028 N82-14662
Technology change and energy consumption: A comparison of residential subdivisions
[DE81-030075] p0031 N82-15555
Incremental cooling load determination for passive direct gain heating systems
[DE81-029882] p0081 N82-15575

RESIDUAL STRESS
Residual stresses in darrieus vertical axis wind turbine blades
[DE81-1026144] p0136 N82-10434

RESIDUES
Costs for alternative grain-residue-collection systems
[DE81-029072] p0110 N82-12633

RESISTANCE HEATING
Baking of carbon anodes for the electrolysis of aluminum by electric resistance heating
[BMFT-FB-T-81-168] p0030 N82-15168

RESISTORS
Two-dimensional effects in power take-off region
[DE82-000091] p0141 N82-13367

RESONANT FREQUENCIES
Calculation of natural modes of vibration for rotor blades by the finite element method
[DFVLR-FB-81-07] p0136 N82-10452

RESOURCE ALLOCATION
Maritime support for ocean-resources development
[AD-A104730] p0111 N82-12735
Natural gas plan needed to provide greater protection for high-priority and critical uses
[PB81-228488] p0023 N82-13255
Role of large scale energy systems models in R&D planning
[DE81-026058] p0031 N82-15543

RESOURCES MANAGEMENT
Montana geothermal handbook: A guide to agencies, regulations, permits and financial aids for geothermal development
[DE81-024315] p0007 N82-10562
Energy analysis of human ecosystems in an Appalachian coal county
[DE81-025177] p0013 N82-11574
Urban ecosystem and resource-conserving urbanism in Third World cities
[DE81-029854] p0016 N82-11995
Development of peatlands in northern Minnesota
[DE82-000873] p0112 N82-13475

RESPIRATION
Low-Btu-gasifier emissions toxicology
[DE81-031000] p0014 N82-11651
Carcinogenic effects of coal-conversion materials
[DE81-028108] p0029 N82-14803

RETORT PROCESSING
Production of synthetic crude oil from coal using the TOSCOAL pyrolysis process
p0090 A82-11849
Application of HTGR process heat to oil shale retorting
p0090 A82-11851
Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-000482] p0106 N82-12200
Design and test of two-step solar oil shale retort
[DE82-000964] p0077 N82-13543

RETROFITTING
Problems and potential for MHD retrofit of existing coal-fired plants
[AIAA PAPER 81-2586] p0130 A82-14036
Summary of passive-solar-retrofit workshops
[DE81-028146] p0045 N82-10547
An evaluation of three-way control single and dual bed catalysts as applied to heavy-duty gasoline engines
[PB81-224982] p0012 N82-11477
EPA evaluation of the FUEL-MAX device under Section 511 of the Motor Vehicle Information and Cost Savings Act
[PB81-229866] p0012 N82-11479
EPA evaluation of the Automotive Cylinder Deactivator System (ACDS) under Section 511 of the Motor Vehicle Information and Cost Saving Act
[PB81-228256] p0013 N82-11480
Passive-solar-retrofit study for the United States Navy
[DE81-028921] p0074 N82-12629
Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study
[DE81-028402] p0074 N82-12630
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] p0081 N82-15544

REVERSE FIELD PINCH
The tilting mode in field-reversed configurations --- stability of toroidal plasma equilibria
p0121 A82-11131

REVERSE OSMOSIS
Treatment of biomass gasification wastewaters using reverse osmosis
[DE82-000698] p0025 N82-13564

RHEOLOGY
Study of gelled LNG
[DE81-023259] p0095 N82-10269
Thermophysical properties of coal liquids
[DE81-0279446] p0097 N82-10938
H-Coal product physical properties measurement
[DE81-029095] p0111 N82-13245
Improved polymers for enhanced oil recovery synthesis and rheology
[DE81-030194] p0118 N82-15509

RHODE ISLAND
Planning a comprehensive program for exploration of the anthracite deposits of the Narragansett Basin of Massachusetts and Rhode Island, phase 1 and 2
[DE81-028490] p0104 N82-11519
Exploration of coal and anthracitic carbonaceous shale resources, Narragansett Basin, Massachusetts, and Rhode Island
[DE81-030895] p0104 N82-11523

RIBBONS
A study of the purification process during the elaboration by electron bombardment of polysilicon ribbons designed for photovoltaic conversion
p0057 A82-16054

RIPPLES
Wind ripple analysis
[AIAA PAPER 81-2580] p0129 A82-14033

RIVER BASINS
Geology of the nahcolite deposits and associated oil shales of the Green River Formation in the Piceance Creek Basin, Colorado
p0105 N82-11683

RIVERS
Preliminary investigation on a primary energy saving heat supply system for the residential district "Maria Lindenhof" in Dorsten, West Germany --- using river water as a heat source and systems engineering
[BMFT-FB-T-80-157] p0008 N82-10572

ROADWAY POWERED VEHICLES
Future of electricity for automobiles: Advanced electric vehicle concepts
[DE81-028235] p0029 N82-14987

ROCK MECHANICS
Sandia program in geothermal technology development
[DE81-025394] p0119 N82-15506

ROCKETS
Solar project description for Public Service Company of New Mexico (lot 7) single family residence, Rio Rancho, New Mexico
[DE81-027853] p0063 N82-10509

ROCKS
Development of man-made geothermal reservoirs --- extracting heat from hot dry rock
[LA-UR-81-852] p0097 N82-10480
Hot dry rock geothermal prospects, 1981
[DE81-025305] p0119 N82-15559

ROLLERS
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] p0159 N82-12445

ROTARY WING AIRCRAFT
The stability of a tethered gyromill
[AIAA PAPER 81-2569] p0129 A82-14026

ROTATING BODIES
Composite flywheel balance experience
[DE81-769341] p0157 N82-10549

Rotating regenerative heat exchanger for energy recovery in chemical plants
[BNFT-FB-T-81-099] p0030 N82-15367
ROTATING GENERATORS
Applications of power beaming from space-based nuclear power stations p0145 A82-11746
Fabrication, testing, and modeling plans for a 125-kW counter-rotating-turbine wave energy converter
[DE81-023946] p0137 N82-10559
ROTOR AERODYNAMICS
The effect of shielding on the aerodynamic performance of Savonius wind turbines p0125 A82-11826
Methodology for the evaluation of aerodynamic performance and rotor optimization under constant RPMoperation
[AIAA PAPER 81-2560] p0128 A82-14019
Rotor speed control by automatic yawing of two-bladed wind turbines with passive cyclic pitch variation
[AIAA PAPER 81-2570] p0129 A82-14027
Up- and down-wind rotor half interference model for VAWT --- Vertical Axis Wind Turbines
[AIAA PAPER 81-2579] p0129 A82-14031
Aerodynamic loads and rotor performance for the Darrieus wind turbines
[AIAA PAPER 81-2582] p0130 A82-14034
An analytic model of high solidity vertical axis windmills p0131 A82-14360
First results from the UMass wind tunnel test program --- for windpowered generator optimization p0134 A82-17643
Yawing of wind turbines with blade cyclic pitch variation
[DE81-030091] p0138 N82-11045
German-Argentine experiment: Vertical-rotor wind engine p0141 N82-12648
ROTOR BLADES
Application of orthotropic plate theory to windmill blade design p0121 A82-10978
ROTOR BLADES (TURBOMACHINERY)
Methodology for the evaluation of aerodynamic performance and rotor optimization under constant RPMoperation
[AIAA PAPER 81-2560] p0128 A82-14019
Lightning protection for composite rotor blades --- of windpowered turbines p0133 A82-17631
Aluminum blade development for the Mod-0A 200-kilowatt wind turbine
[NASA-TM-82594] p0143 N82-14633
ROTOR SPEED
Performance testing of a Savonius windmill rotor in shear flows p0125 A82-11827
Rotor speed control by automatic yawing of two-bladed wind turbines with passive cyclic pitch variation
[AIAA PAPER 81-2570] p0129 A82-14027
Controlled velocity testing of small wind energy conversion systems - An evaluation of a technique p0134 A82-17642
ROTORS
Performance of a small low speed Darrieus type rotor p0136 A82-18328
RUN TIME (COMPUTERS)
Theoretical basis of the DOE-2 building energy use analysis program
[DE81-026896] p0030 N82-15242
RURAL AREAS
Wind energy and the Nation's rural electric systems p0091 A82-17645
Project demonstration of wind-turbine electricity: Interconnecting a northern Michigan fruit farm with a major utility
[DE81-030950] p0138 N82-11380
RUTHENIUM
Transportation fuels from synthetic gas
[DE81-029614] p0102 N82-11258
RUTILE
The use of semiconducting oxide ceramics in solar energy conversion p0059 A82-17099

S

SAFETY
Space nuclear safety and fuels program p0111 N82-12921
SAFETY DEVICES
Operations of small wind turbines on a distribution system p0133 A82-17633
SAFETY FACTORS
Aspects concerning the safety of hydrogen p0085 A82-17132
Experiences with a Grumman windstream 25 --- horizontal axis wind turbine p0134 A82-17638
SAFETY MANAGEMENT
Safety and technical optimization of belt transfer points with special consideration for the suppression of noxious and explosive dusts --- in coal plants
[BMFT-FB-HA-80-048] p0096 N82-10279
Fire-protection research for energy technology: Fy 80 year end report
[DE82-000970] p0161 N82-14649
SALTS
Thermal storage in salt-hydrates p0153 A82-10018
SAMPLING
Techniques for geothermal liquid sampling and analysis
[DE81-030151] p0098 N82-11149
Sampling design for the 1980 commercial and multifamily residential building survey
[DE81-028783] p0011 N82-11320
SATELLITE NETWORKS
Solar power satellite system energy balance p0050 A82-12509
Effects of the Satellite Power System on low Earth orbit and geosynchronous satellites
[PB81-232019] p0150 N82-13157
SATELLITE POWER TRANSMISSION (TO EARTH)
Solar power satellite microwave power transmission and reception system p0145 A82-11743
Antenna optimization and cost consideration for the Solar Power Satellite microwave system p0145 A82-11744
Applications of power beaming from space-based nuclear power stations p0145 A82-11746
Microwave power transmission by satellites p0145 A82-12503
Space chamber experiments of ohmic heating by high power microwave from the Solar Power Satellite p0145 A82-16991
Status of the microwave power transmission components for the solar power satellite p0146 A82-17982
Workshop on Microwave Power Transmission and Reception. Workshop paper summaries
[NASA-TM-84064] p0146 N82-12538
An active alignment scheme for the MPTS array p0147 N82-12541
Ionospheric power beam studies p0147 N82-12542
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal p0147 N82-12543
Coherent multiple tone technique for ground based SPS phase control p0147 N82-12546
An interferometer-based phase control system p0147 N82-12547
A sonic satellite power system microwave power transmission simulator p0147 N82-12548
SPS phase control studies p0147 N82-12549
SPS fiber optic link assessment p0147 N82-12550
Effects of the Satellite Power System on low Earth orbit and geosynchronous satellites
[PB81-232019] p0150 N82-13157
SATELLITE SOLAR ENERGY CONVERSION
Advanced Satellite Power System /SPS/ concept p0049 A82-11839

Investigation of direct solar-to-microwave energy conversion techniques
[NASA-CR-161683] p0067 N82-11544
Silicon solar cell optimization
[AD-A106005] p0076 N82-13514
Satellite power system: Concept development and evaluation program. Volume 4: Energy conversion and power management
[NASA-TM-58237-VOL-4] p0078 N82-14634

SATELLITE SOLAR POWER STATIONS
Satellite power systems /SPS/ energy conversion and power management
p0045 A82-11742
International Scientific Conference on Space, 21st, Rome, Italy, March 25, 26, 1981, Proceedings
p0050 A82-12501
Market potential and problems for SSPS
p0050 A82-12502
Methods and problems of industrial-scale electric power generation from solar energy
p0050 A82-12506
Status of the microwave power transmission components for the solar power satellite
p0146 A82-17982
System performance conclusions
p0146 N82-12539
SPS large array simulation
p0071 N82-12540
Performance analysis and simulation of the SPS reference phase control system
p0071 N82-12544
Coherent multiple tone technique for ground based SPS phase control
p0147 N82-12546
The adapting of the crossed-field directional amplifier to the requirements of the SPS
p0148 N82-12554
SPS antenna element evaluation
p0148 N82-12555
The Resonant Cavity Radiator (RCR)
p0148 N82-12556
Evaluation of thick wall wave guide element
p0148 N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS
p0148 N82-12558
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays
p0148 N82-12559
The history of the development of the rectenna
p0149 N82-12560
Rectenna system design
p0149 N82-12561
Rectenna session: Micro aspects
p0149 N82-12562
A theoretical study of microwave beam absorption by a rectenna
p0149 N82-12563
Rectenna array measurement results
p0149 N82-12564
Session on solid state: Introduction
p0149 N82-12565
Modified reference SPS with solid state transmitting antenna
p0149 N82-12566
SPS solid state antenna power combiner
p0149 N82-12567
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite
p0149 N82-12568
Satellite power system: Concept development and evaluation program. Volume 4: Energy conversion and power management
[NASA-TM-58237-VOL-4] p0078 N82-14634
Satellite power system: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238-VOL-7] p0078 N82-14635

SAUDI ARABIA
Utilization of wind/solar energy in generating electricity in Saudi Arabia
p0049 A82-11830

SCALE MODELS
The effect of variable fluid properties on scale modeling --- of solar central receivers
p0049 A82-12269

SCALING LAWS
MHD generator scaling analysis for baseload commercial power plants
[AIAA PAPER 82-0394] p0135 A82-17922

SCHEDULES
Magnetohydrodynamics MHD Engineering Test Facility ETF 200 MWe power plant. Conceptual Design Engineering Report CDER. Volume 3: Costs and schedules
[NASA-CR-165452-VOL-3] p0137 N82-10495

SCHOTTKY DIODES
Carrier-collection efficiencies in amorphous hydrogenated silicon Schottky-barrier solar cells
p0042 A82-11185
Low frequency capacitance characterizations on indium/x-phase of metal free phthalocyanine solar cells
p0053 A82-13806
A pinhole model for metal-insulator-semiconductor solar cells
p0056 A82-15442
A comparison of p-i-n and Schottky barrier hydrogenated amorphous silicon, a-Si:H, solar cells
p0060 A82-17649
Controlled cadmium telluride thin films for solar-cell applications
[DE81-023275] p0066 N82-10569

SCRUBBERS
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626

SEA WATER
Experimental demonstration of the feasibility of the Mist Flow Ocean Thermal Energy Process
[AIAA PAPER 81-2596] p0136 A82-18223
Response of the oceans to increasing atmospheric carbon dioxide
[DE81-028178] p0025 N82-13558

SEASAT SATELLITES
The Seasat commercial demonstration program
p0115 N82-14561

SECULAR VARIATIONS
The annual variation of atmospheric CO2 concentration observed in the Northern Hemisphere
p0002 A82-12156

SEDIMENT TRANSPORT
Chemical and geochemical studies off the coast of Washington
[DE81-030319] p0017 N82-12513

SELECTIVE DISSEMINATION OF INFORMATION
Information resources in the USA on new and renewable energy, a description and directory
[DE81-028867] p0024 N82-13522

SELENIUM
Investigations on a Se-CdO photovoltaic cell
p0132 A82-16052

SEMICONDUCTING FILMS
The optimization of solar conversion devices
p0039 A82-10025
V2O5-Si photovoltaic cells
p0051 A82-12824
A new low temperature III-V multilayer growth technique - Vacuum metalorganic chemical vapor deposition --- of GaAs thin films
p0053 A82-13803
Nickel sulphide-lead sulphide and nickel sulphide-cadmium sulphide selective coatings for solar thermal conversion
p0059 A82-16745
Metallurgical coatings 1980; Proceedings of the Seventh International Conference, San Diego, CA, April 21-25, 1980. Volumes 1 & 2
p0161 A82-17251

SEMICONDUCTOR DEVICES
Semiconductor converters/inverters for photovoltaic power supply
p0126 A82-11857
Increasing power and efficiency by dynamic suppression of ionization instability in a plasma
p0127 A82-12897
Dependence of minority carrier diffusion length on illumination level and temperature in single crystal and polycrystalline Si solar cells
p0053 A82-13804
Electrochemical photovoltaic cells
[DE81-769704] p0066 N82-10568

SEMICONDUCTOR JUNCTIONS
Advanced high temperature thermoelectrics for space power
p0125 A82-11823
Current-voltage characteristics of semiconductor-electrolyte junction solar cells
p0055 A82-15112
A new structure for a semiconductor-insulator-semiconductor solar cell
p0057 A82-15911
SEMICONDUCTORS (MATERIALS)
Heterojunctions for thin film solar cells
p0039 A82-10024
The use of semiconducting oxide ceramics in solar energy conversion
p0059 A82-17099
Model based studies of some optical and electronic properties of narrow and wide gap materials
p0062 A82-18471
SEPARATION
Selective separation of coal feedstocks for conversion by magnetic separation techniques
[DE81-028060] p0108 N82-12263
SEPARATORS
Laboratory study for removal of organic sulfur from coal
[DE81-025132] p0010 N82-11239
Development of battery separator composites
[NASA-CR-165508] p0157 N82-11547
SERVICE LIFE
Introduction to solar materials science
p0037 A82-10008
Effect of depth of discharge on cycle life of near-term batteries
p0153 A82-11714
Ampere-hour integrator battery charge controller
p0153 A82-11737
Life-testing of 1.7 kW h zinc-chloride battery system - Cycles 1 - 1000
p0155 A82-18498
SERVICE MODULES
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] p0019 N82-12635
SEWAGE TREATMENT
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] p0110 N82-12620
Parallel evaluation of air-and oxygen-activated sludge
[PB81-246712] p0034 N82-15633
SHALE OIL
Application of HTGR process heat to oil shale retorting
p0090 A82-11851
Jet fuel looks to shale oil: The 1980 technology review
[AD-A104414] p0100 N82-11228
Assessment of oil-shale technology in Brazil
[DE81-027574] p0010 N82-11249
Geology of the nahcolite deposits and associated oil shales of the Green River Formation in the Piceance Creek Basin, Colorado
p0105 N82-11683
Investigation of factors affecting the in-situ combustion retorting of oil shale
[DE82-000462] p0106 N82-12200
Evaluation of shale oil as a utility gas-turbine fuel
[DE81-904234] p0107 N82-12251
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] p0111 N82-12731
Identification and toxicity of fractionated-shale-oil components
[DE81-028860] p0021 N82-12766
Solar-central-receiver fuels and chemicals
[DE82-000941] p0077 N82-13530
Design and test of two-step solar oil shale retort
[DE82-000964] p0077 N82-13543
Development of superior denitrogenation and isomerization catalysts for processing crude oil derived from shale, part 1
[AD-A105667] p0113 N82-14317
SHALES
Alumina recovery from fly ash and shale-retort wastes
[DE81-027675] p0099 N82-11154
Exploration of coal and anthracitic carbonaceous shale resources, Narragansett Basin, Massachusetts, and Rhode Island
[DE81-030895] p0104 N82-11523
Pyrolytic characterization of the organic matter in selected coals and in the Devonian shales of southern West Virginia
p0113 N82-13578
Evaluation of Devonian shale potential in eastern Kentucky/Tennessee
[DE82-001164] p0116 N82-14595
SHEAR FLOW
Performance testing of a Savonius windmill rotor in shear flows
p0125 A82-11827
Study of gelled LNG
[DE81-023259] p0095 N82-10269
SHEAR LAYERS
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] p0140 N82-12537
SHELTERS
Earth shelter 2. 1979-1980 USC series
[CONF-800438] p0006 N82-10277
SHIELDING
The effect of shielding on the aerodynamic performance of Savonius wind turbines
p0125 A82-11826
SHIPS
A design for an MHD power plant as a prime mover for a Naval Vessel
[AIAA PAPER 81-2575] p0129 A82-14032
SHORT CIRCUITS
Temperature dependence of the short-circuit current in MIS solar cells
p0052 A82-12825
SHROUDED TURBINES
Computational analysis of diffuser-augmented wind turbines
p0132 A82-16743
SILANES
Introduction to basic aspects of plasma-deposited amorphous semiconductor alloys in photovoltaic conversion
p0039 A82-10026
Carrier-collection efficiencies in amorphous hydrogenated silicon Schottky-barrier solar cells
p0042 A82-11185
Impurity effects in a-Si:H solar cells
[DE81-025069] p0069 N82-11575
SILICA GLASS
Optical degradation of antireflective silica film on solar collector windows
p0041 A82-10836
SILICON
V2O5-Si photovoltaic cells
p0051 A82-12824
Amorphous silicon bibliography - Introduction
p0053 A82-13737
High efficiency inversion layer solar cells on polycrystalline silicon by the application of silicon nitride
p0058 A82-16127
Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 N82-10490
The effects of impurities on the performance of silicon solar cells
[NASA-CR-164945] p0067 N82-11548
A Module Experimental Process System Development Unit (MEPSDU)
[NASA-CR-165014] p0076 N82-13496
Flat-plate solar array project. Task 1: Silicon material: Investigation of the hydrochlorination of SiC1sub4
[NASA-CR-165042] p0078 N82-14631
SILICON ALLOYS
Progress in large area photovoltaic devices based on amorphous silicon alloys
p0049 A82-11855
Amorphous boron-silicon-hydrogen alloys for thin-film heterojunction solar cells
[DE81-027254] p0068 N82-11558
Impurity effects in a-Si:H solar cells
[DE81-025069] p0069 N82-11575

SILICON CARBIDES
Characteristics of CVD silicon carbide thermionic converters p0124 A82-11821
SILICON COMPOUNDS
Stability of a-i-p amorphous silicon solar cells p0043 A82-11343
SILICON FILMS
Low cost silicon-on-ceramic photovoltaic solar cells p0059 A82-17098
SILICON JUNCTIONS
Efficient Si solar cells by low-temperature solid-phase epitaxy p0043 A82-11344
Cascade photogenerators based on silicon and germanium matrix photoconverters p0044 A82-11422
'Thin foil cells - A challenge for space array designers' p0049 A82-11842
Series resistance effects in 20 sq cm indium tin oxide-polycrystalline silicon solar cells p0051 A82-12819
Oxide optimization at the p-Si/aqueous electrolyte interface p0052 A82-13199
Production and certain properties of photoelectric cells based on silicon epitaxial structures p0053 A82-13716
Silicon and gallium arsenide photovoltaic cells - Models for the functioning, experimentation, and application to concentrating collectors --- French thesis p0055 A82-15006
Theory of back surface field silicon solar cells p0056 A82-15447
Grain size dependence of the photovoltaic properties of solar grade polysilicon p0057 A82-16051
A study of the purification process during the elaboration by electron bombardment of polysilicon ribbons designed for photovoltaic conversion p0057 A82-16054
K/u/-band flat-profile Si-IMPATT diodes with 10-percent efficiency p0058 A82-16132
Influence of the junction area to edge area ratio on the open-circuit voltage of silicon solar cells p0058 A82-16133
Effects of heat treatment on epitaxial silicon solar cells on metallurgical silicon substrates p0058 A82-16469
A comparison of p-i-n and Schottky barrier hydrogenated amorphous silicon, a-Si:H, solar cells p0060 A82-17649
SILICON NITRIDES
High efficiency inversion layer solar cells on polycrystalline silicon by the application of silicon nitride p0058 A82-16127
SILVER ZINC BATTERIES
Development of battery separator composites [NASA-CR-165508] p0157 N82-11547
SIMULATORS
Solar heat pump simulator [DE81-024368] p0070 N82-11583
A sonic satellite power system microwave power transmission simulator p0147 N82-12548
SINTERING
Production of alloys of bismuth telluride for solar thermoelectric generators p0041 A82-10471
Effect of annealing CdS on a sintered CdS/Cu2S solar cell p0051 A82-12820
SIS (SEMICONDUCTORS)
A new structure for a semiconductor-insulator-semiconductor solar cell p0057 A82-15911
SITE SELECTION
Implementation of a siting methodology for utility size WECS in western Massachusetts and northwestern Connecticut [AIAA PAPER 81-2540] p0091 A82-14008
Siting and land-use considerations in wind energy development [AIAA PAPER 81-2541] p0003 A82-14009
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 5: Site selection [DE81-028199] p0156 N82-10529
Analysis of data from the US Department of Energy's meteorological validation program [DE81-030100] p0097 N82-10858
Low/medium-Btu coal-gasification assessment program for specific sites of two New York utilities [DE81-025518] p0101 N82-11240
Site selection for small wind energy conversion systems for US Department of Energy field evaluation program [PB81-226062] p0014 N82-11624
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada [DE82-000529] p0109 N82-12516
Environmental data for sites in the National Solar Data Network [DE82-000071] p0075 N82-12707
Residual-energy-applications program environmental analysis report --- industrial scale waste heat recovery equipment and utilization [DE81-027538] p0024 N82-13525
Application of Bayesian analysis for wind energy site evaluation p0113 N82-13619
Sixth Underground Coal-Conversion Symposium [DE81-027669] p0114 N82-14374
Hot dry rock geothermal prospects, 1981 [DE81-025305] p0119 N82-15559
SIZE DETERMINATION
One viewpoint concerning unit size in the development of wind turbines p0131 A82-14045
SLAGS
Advances in coal fired MHD generator research p0126 A82-11853
Mass spectrometric studies of MHD slag thermochemistry [PB81-221434] p0138 N82-11173
Electrical effects of slag in a diffuse mode magnetohydrodynamic generator p0143 N82-13550
Coal conversion solid waste disposal [DE81-028567] p0116 N82-14680
SLOT ANTENNAS
SPS antenna element evaluation p0148 N82-12555
Evaluation of thick wall wave guide element p0148 N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS p0148 N82-12558
SLUDGE
Production and utilization of methane from anaerobic sludge digestion in U.S. wastewater-treatment plants [DE81-029958] p0101 N82-11246
Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology [DE82-001142] p0110 N82-12596
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment [DE82-000525] p0021 N82-12674
SLURRIES
Thermophysical properties of coal liquids [DE81-027944G] p0097 N82-10930
Transport characteristics of alternate slurry fuels [DE81-026580] p0146 N82-11255
Solvent-Refined Coal (SRC) process [DE81-031937] p0106 N82-12197
Measurement of thermal conductivities in coal fluids [DE82-000523] p0109 N82-12400
H-Coal product physical properties measurement [DE81-029095] p0111 N82-13245
Failure modes and effects analysis of a coal-slurry preheater [DE81-030425] p0117 N82-15221

SMELTING
Sulfur pollution control. Phase 1: The disposal program
[PB81-222612] p0014 N82-11652
SOCIAL FACTORS
Factors in the development of a major US synthetic fuels industry
p0001 A82-11543
Near-term goals for alcohol fuels from biomass: An overview of resource requirements, land use, environmental, and socioeconomic impacts --- ethyl alcohol production
[DE81-029987] p0010 N82-11245
Energy analysis of human ecosystems in an Appalachian coal county
[DE81-025177] p0013 N82-11574
SODIUM CHLORIDES
Design and economics of direct-contact salt hydrate storage systems
[SERI/TP-631-1163] p0160 N82-15558
SODIUM COOLING
The design of a sodium-cooled 2.7 MW receiver for a solar power plant
p0059 A82-17126
SODIUM HYDROXIDES
Laboratory study for removal of organic sulfur from coal
[DE81-025132] p0010 N82-11239
SODIUM IODIDES
Photoelectrochemical behaviour of CdS/NaI.3.3NH3 /liquid sodium iodide ammoniate/ junctions - Utilization in solar energy conversion
p0051 A82-12822
SODIUM SULFUR BATTERIES
Recent progress on the development of the Dow hollow fiber sodium-sulfur battery
p0123 A82-11777
Small sodium sulfur battery for solar and wind energy systems
p0047 A82-11778
SOILS
Investigation of direct expansion in ground source heat pumps
[DE81-024139] p0012 N82-11418
Geothermal environmental assessment: Behavior of selected geothermal brine contaminants in plants and soils
[PB81-222333] p0015 N82-11671
SOLAR ARRAYS
Boiling flow instability of a fixed mirror distributed focus solar receiver
p0041 A82-10810
The contoured-oxide monolithic series-array solar battery
p0042 A82-11190
Cascade photogenerators based on silicon and germanium matrix photoconverters
p0044 A82-11422
Combined solar-energy converters with selective coatings
p0044 A82-11424
High power solar array switching regulation
p0045 A82-11736
High performance silicon solar arrays employing advanced structures
p0045 A82-11758
Solar panel current degradation factors
p0045 A82-11759
Nonimaging concentrators for photovoltaic arrays in space
p0046 A82-11761
The evaluation of four solar-array-powered multi-kW power conditioners for Space Shuttle Orbiter application
p0046 A82-11772
The design of series-parallel connected thermionic converter arrays
p0124 A82-11820
'Thin foil cells - A challenge for space array designers'
p0049 A82-11842
Progress in large area photovoltaic devices based on amorphous silicon alloys
p0049 A82-11855
A technological approach towards future large solar arrays
p0055 A82-14446
Bounds and exact theories for the transport properties of inhomogeneous media
p0056 A82-15607
The El Paso electric 20-kilowatt photovoltaic system [AIAA PAPER 82-0064] p0060 A82-17761
The Mt. Laguna photovoltaic project [AIAA PAPER 82-0065] p0061 A82-17762
The Lea county electric 100-kilowatt grid-connected photovoltaic system [AIAA PAPER 82-0067] p0061 A82-17764
Startup experience with a concentrating photovoltaic power system [AIAA PAPER 82-0068] p0061 A82-17765
Economic analysis of the unified heliostat array [DE81-026698] p0064 N82-10516
Intermediate photovoltaic-system application experiment operational performance report. Volume 1: For Lovington Square Shopping Center site, Lovington, New Mexico
[DE81-028971] p0065 N82-10543
Solar cell development for the power extension package
[NASA-TM-82685] p0068 N82-11551
Mississippi County Community College solar photovoltaic project
[DE81-030669] p0068 N82-11554
System performance conclusions
p0146 N82-12539
SPS large array simulation
p0071 N82-12540
An active alignment scheme for the MPTS array
p0147 N82-12541
Design and breadboard evaluation of the SPS reference phase control system concept
p0072 N82-12545
Ionospheric effects in active retrodirective array and mitigating system design
p0147 N82-12551
Space applicable DOE photovoltaic technology: An update
[NASA-CR-165021] p0076 N82-13491
Inexpensive thermographic techniques for determining reliable solar-collector-array performance
[DE82-001151] p0076 N82-13528
Data report for the Northeast residential experiment station, June 1981 --- photovoltaic systems
[DE82-000068] p0077 N82-13533
Flat-plate solar array project. Task 1: Silicon material: Investigation of the hydrochlorination of SiC1sub4
[NASA-CR-165042] p0078 N82-14631
Study of multi-megawatt technology needs for photovoltaic space power systems. Volume 1: Executive summary
[NASA-CR-165323-VOL-1] p0078 N82-14636
Solar power systems smaller than 500 W for military use
[PNL-1980-06] p0080 N82-15534
SOLAR BLANKETS
Cost and performance projections for SPS photovoltaic blankets
p0045 A82-11741
High performance silicon solar arrays employing advanced structures
p0045 A82-11758
SOLAR CELLS
Introduction to photovoltaics - Physics, materials and technology
p0038 A82-10022
Research and device problems in photovoltaics
p0039 A82-10023
Heterojunctions for thin film solar cells
p0039 A82-10024
The optimization of solar conversion devices
p0039 A82-10025

ZnO - p-InP heterojunction solar cells p0051 A82-12821

Photoelectrochemical behaviour of CdS/NaI.3.3H3 /liquid sodium iodide ammoniate/ junctions - Utilization in solar energy conversion p0051 A82-12822

A practical method of analysis of the current-voltage characteristics of solar cells p0051 A82-12823

V2O5-Si photovoltaic cells p0051 A82-12824

Temperature dependence of the short-circuit current in MIS solar cells p0052 A82-12825

Oxide optimization at the p-Si/aqueous electrolyte interface p0052 A82-13199

Thin-film gallium arsenide homojunction solar cells p0052 A82-13200

Investigation of the possibility of using inexpensive concentrating systems in the modules of a photoelectric station p0052 A82-13713

Production and certain properties of photoelectric cells based on silicon epitaxial structures p0053 A82-13716

A new low temperature III-V multilayer growth technique - Vacuum metalorganic chemical vapor deposition --- of GaAs thin films p0053 A82-13803

Dependence of minority carrier diffusion length on illumination level and temperature in single crystal and polycrystalline Si solar cells p0053 A82-13804

Investigation of the performance of an MoS2/I-/I2/C electrochemical solar cell p0053 A82-13805

Low frequency capacitance characterizations on indium/x-phase of metal free phthalocyanine solar cells p0053 A82-13806

Gallium-arsenic-antimony heterojunction photocells p0055 A82-14667

Silicon and gallium arsenide photovoltaic cells - Models for the functioning, experimentation, and application to concentrating collectors --- French thesis p0055 A82-15006

Sputtered thin film electrodes for photoelectrochemical cells p0055 A82-15111

Current-voltage characteristics of semiconductor-electrolyte junction solar cells p0055 A82-15112

An analytical model for high-low-emitter /HLE/ solar cells in concentrated sunlight p0055 A82-15441

A pinhole model for metal-insulator-semiconductor solar cells p0056 A82-15442

Effect of junction depth on the performance of a diffused n/+/p silicon solar cell p0056 A82-15444

Theory of back surface field silicon solar cells p0056 A82-15447

A new structure for a semiconductor-insulator-semiconductor solar cell p0057 A82-15911

Grain size dependence of the photovoltaic properties of solar grade polysilicon p0057 A82-16051

High efficiency inversion layer solar cells on polycrystalline silicon by the application of silicon nitride p0058 A82-16127

A method for experimental assessment of the shifting approximation, with application to polysilicon solar cells --- effect of constant series resistance p0058 A82-16131

K/u/-band flat-profile Si-IMPATT diodes with 10-percent efficiency p0058 A82-16132

Influence of the junction area to edge area ratio on the open-circuit voltage of silicon solar cells p0058 A82-16133

Effects of heat treatment on epitaxial silicon solar cells on metallurgical silicon substrates p0058 A82-16469

n-/indium tin oxide//p-InP solar cells p0058 A82-16471

Effects of double-exponential current-voltage characteristics on the performance of solar cells p0058 A82-16472

Effects of processing parameters on thick film inks used for solar cell front metallization p0058 A82-16474

Low cost silicon-on-ceramic photovoltaic solar cells p0059 A82-17098

A comparison of p-i-n and Schottky barrier hydrogenated amorphous silicon, a-Si:H, solar cells
p0060 A82-17649
Field nonuniformity due to photogenerated carriers in a p-i-n solar cell
p0060 A82-17650
Effects of low temperature periodic annealing on the deep-level defects in 200 keV proton irradiated AlGaAs-GaAs solar cells
p0061 A82-18287
Model based studies of some optical and electronic properties of narrow and wide gap materials
p0062 A82-18471
Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 N82-10490
Thin film photovoltaic devices
p0063 N82-10491
Silicon solar cell process development, fabrication and analysis
[NASA-CR-163787] p0063 N82-10500
Optimization of transparent electrode for solar cells
[DE81-023359] p0063 N82-10507
Investigation of photovoltaic mechanisms in polycrystalline thin-film solar cells
[DE81-027272] p0065 N82-10539
Controlled cadmium telluride thin films for solar-cell applications
[DE81-023275] p0066 N82-10569
Automated Fresnel lens tester system
[DE81-029483] p0066 N82-10863
The effects of impurities on the performance of silicon solar cells
[NASA-CR-164945] p0067 N82-11548
Solar cell development for the power extension package
[NASA-TM-82685] p0068 N82-11551
Amorphous boron-silicon-hydrogen alloys for thin-film heterojunction solar cells
[DE81-027234] p0068 N82-11557
Amorphous boron-silicon-hydrogen alloys for thin-film heterojunction solar cells
[DE81-027254] p0068 N82-11558
Impurity effects in a-Si:H solar cells
[DE81-025069] p0069 N82-11575
Zn3P2 as an improved semiconductor for photovoltaic solar cells
[DE81-025587] p0069 N82-11577
National photovoltaic program in amorphous materials
[DE81-025906] p0070 N82-11609
Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas
[DE81-031934] p0072 N82-12602
Photovoltaic mechanisms in polycrystalline thin film silicon solar cells
[DE81-030370] p0072 N82-12608
Distributed photovoltaic systems: Utility interface issues and their present status
[NASA-CR-165019] p0076 N82-13492
High resolution, low cost solar cell contact development
[NASA-CR-165032] p0076 N82-13501
Silicon solar cell optimization
[AD-A106005] p0076 N82-13514
Development of an all-metal thick film cost effective metallization system for solar cells
[NASA-CR-165043] p0078 N82-14630
Satellite power system: Concept development and evaluation program. Volume 4: Energy conversion and power management
[NASA-TM-58237-VOL-4] p0078 N82-14634
Study of multi-megawatt technology needs for photovoltaic space power systems. Volume 1: Executive summary
[NASA-CR-165323-VOL-1] p0078 N82-14636
REPRAT facility. Report for May, June, July
[DE81-028156] p0079 N82-14665
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] p0081 N82-15569
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029883] p0082 N82-15578

Solar mirror materials - Their properties and uses in solar concentrating collectors
p0037 A82-10012
The effect of soiling on solar mirrors and techniques used to maintain high reflectivity
p0037 A82-10013
The emissivity of metals --- frequency and temperature dependence calculations for solar collector design
p0038 A82-10014
Corrosion science and its application to solar thermal energy material problems
p0038 A82-10017
Research and device problems in photovoltaics
p0039 A82-10023
Investigation of abrasive action of atmospheric particles on the reflectance of mirrors
p0040 A82-10388
Experimental investigation of parabolic-cylinder solar concentration with tubular heat receiver
p0040 A82-10389
Spectrally selective copper sulphide coatings
p0040 A82-10468
Production of alloys of bismuth telluride for solar thermoelectric generators
p0041 A82-10471
Boiling flow instability of a fixed mirror distributed focus solar receiver
p0041 A82-10810
Optical degradation of antireflective silica film on solar collector windows
p0041 A82-10836
AAI Corporation receiver design experience in concentrating solar collectors
[ASME PAPER 81-SOL-1] p0041 A82-10969
Development of a solar thermal central heat receiver using molten salt
[ASME PAPER 81-SOL-2] p0041 A82-10970
Testing of the U.S. Solar Pilot Plant receiver
[ASME PAPER 81-SOL-3] p0041 A82-10971
The development and design of steam/water solar receivers for commercial application
[ASME PAPER 81-SOL-4] p0042 A82-10972
Conceptual design of an advanced water/steam receiver for a solar thermal central power system
[ASME PAPER 81-SOL-5] p0042 A82-10973
Simple tracking strategies for solar concentrations
p0042 A82-11207
Design and testing of a uniformly illuminating nontracking concentrator
p0042 A82-11209
Focal plane flux distributions produced by solar concentrating reflectors
p0043 A82-11211
The effect of inclination on the heat loss from flat-plate solar collectors
p0043 A82-11212
Efficiency of Fresnel lenses
p0043 A82-11387
Geometrical optical performance studies of a composite parabolic trough with a fin receiver
p0043 A82-11390
Effect of inhomogeneous flow distribution in a system of heat-generating solar collectors
p0044 A82-11423
Efficiency of selective surfaces for solar thermal collectors
p0044 A82-11425
A spacecraft thermophotovoltaic power source with thermal storage
p0044 A82-11711
Nonimaging concentrators for photovoltaic arrays in space
p0046 A82-11761
Ground-mounted thermal storage for the parabolic dish solar collector/Stirling engine system
p0047 A82-11781
Secondary concentrators for parabolic dish solar thermal power systems
p0048 A82-11798
The effect of concentrator field layout on the EE-1 small community solar power system
p0048 A82-11799

Development of a solar receiver for an organic Rankine cycle engine
p0048 A82-11800
Control system development for a 1 MW/e/ solar thermal power plant
p0048 A82-11801
Dynamic performance analysis for the solar hybrid repowering of the El Paso Electric Company Newman Unit No. 1
p0048 A82-11802
A thermoelectric refrigerator powered by photovoltaic solar collectors
p0049 A82-11858
The effect of variable fluid properties on scale modeling --- of solar central receivers
p0049 A82-12269
Theoretical analysis of the performance of a gravity-controlled solar concentrator
p0050 A82-12812
High-temperature solar central receivers
p0052 A82-12949
Chromatic aberration effect on solar energy systems using Fresnel lenses
p0052 A82-13284
Luminescent solar concentrators. II - Experimental and theoretical analysis of their possible efficiencies
p0052 A82-13285
Investigation of the possibility of using inexpensive concentrating systems in the modules of a photoelectric station
p0052 A82-13713
Analysis of the optical characteristics of solar collectors
p0052 A82-13715
Mathematical simulation model for the operation of the optical system of a solar power station
p0053 A82-13718
Buffer thermal energy storage for a solar Brayton engine
[AIAA PAPER 81-2531] p0053 A82-14002
Development, solar test, and evaluation of a high-temperature air receiver for point-focusing parabolic dish applications
[AIAA PAPER 81-2532] p0053 A82-14003
Solar concentrator panel and gore testing in the JPL 25-foot space simulator
[AIAA PAPER 81-2534] p0054 A82-14005
Use of ceramics in point-focus solar receivers
[AIAA PAPER 81-2552] p0054 A82-14015
A simplified method for direct calculation of the annual load fraction of solar systems for space heating
p0054 A82-14405
Thermal analysis of three zone solar pond
p0054 A82-14406
Optimization of flow passage geometry for air-heating, plate-type solar collectors
p0055 A82-14846
Silicon and gallium arsenide photovoltaic cells - Models for the functioning, experimentation, and application to concentrating collectors --- French thesis
p0055 A82-15006
Colloidally deposited high-temperature solar selective surfaces
p0055 A82-15439
Calculation of the top loss coefficient by the network method and applications to solar collectors
p0056 A82-15653
A solar heating system with annual storage
p0056 A82-15666
Towards a high-temperature solar electric converter
p0056 A82-15903
Sputter etched metal solar selective absorbing surfaces for high temperature thermal collectors
p0057 A82-16057
Natural convection in air layers at various aspect ratios and angles of inclination
p0058 A82-16249
A seasonally adjusted concentrator with modifications of absorber shape
p0059 A82-16598
Theoretical analysis of the Fresnel lens as a function of design parameters --- for solar concentrators
p0059 A82-16599
Optimization of heat losses in normal and reverse flat-plate collector configurations - Analysis and performance
p0059 A82-16784
The design of a sodium-cooled 2.7 MW receiver for a solar power plant
p0059 A82-17126
Solar-thermal experimental projects on the Spanish Plataforma Solar
p0059 A82-17128
Aplanatic double reflection system for thermophotovoltaic applications - Design
p0060 A82-17293
Finite Lambertian source analysis of concentrators - Application to solar reflectors
p0060 A82-17294
Startup experience with a concentrating photovoltaic power system
[AIAA PAPER 82-0068] p0061 A82-17765
High performance solar Stirling system
[AIAA PAPER 81-2554] p0061 A82-18222
Configuration selection study for isolated loads using parabolic dish modules
[AIAA PAPER 81-2549] p0061 A82-18223
Thermal deformation of concentrators in an antisymmetric temperature field
p0062 A82-18698
A simplified model of the thermohydraulic behaviour of a linear collector network for the conversion of the solar energy
p0062 A82-18816
An analytical comparison of the efficiency of solar thermal collector arrays with and without external manifolds
[NASA-CR-161852] p0063 N82-10501
Performance evaluation of the solar kinetics T-700 line concentrating solar collector
[NASA-CR-161856] p0063 N82-10502
Evaluation of All-Day-Efficiency for selected flat plate and evacuated tube collectors
[NASA-CR-161866] p0063 N82-10504
Solar project description for Public Service Company of New Mexico (lot 7) single family residence, Rio Rancho, New Mexico
[DE81-027853] p0063 N82-10509
Frequency response analysis of fluid control systems for parabolic-trough solar collectors
[DE81-029293] p0064 N82-10513
Integrated function nonimaging concentrating collector tubes for solar thermal energy
[DE81-029677] p0064 N82-10521
Solar energy system design: A simple method for sizing the collector field and thermal storage
[DE81-028852] p0065 N82-10541
Conceptual design of a glass-reinforced concrete solar collector
[DE81-029280] p0065 N82-10542
Application of solar thermal energy to buildings and industry
[SERI/TP-641-1222] p0066 N82-10563
The young solar collector: An evaluation of its multiple farm uses
[PB81-214132] p0066 N82-10577
Automated Fresnel lens tester system
[DE81-029483] p0066 N82-10863
Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209
Irrigation market for solar thermal parabolic dish systems
[NASA-CR-164955] p0068 N82-11549
Secondary and compound concentrators for parabolic dish solar thermal power systems
[NASA-CR-164960] p0068 N82-11550
Solar energy system performance evaluation: Forest City Dillon, Washington, D.C., January 1980 - December 1980
[DE81-028174] p0068 N82-11560
Solar energy system performance evaluation: Montecito Pines, Santa Rosa, California, November 1979 - April 1980
[DE81-028175] p0068 N82-11561
Design, cost and performance comparisons of several solar thermal systems for process heat. Volume 1: Executive summary
[DE81-029881] p0069 N82-11576
Low-cost solar flat-plate-collector development
[DE81-025081] p0070 N82-11584
Controls for solar heating and cooling
[DE81-025209] p0070 N82-11593

Test results and analysis of a convective loop solar air collector
[DE81-028151] p0070 N82-11599
Performance testing of the TOLTEC TI-410 concentrating solar collector
[DE81-029994] p0071 N82-11617
The Rogers focusing heliostat experimental program at Rensselaer Polytechnic Institute
[PB81-226813] p0071 N82-11625
Guidebook for solar process-heat applications
[DE81-027977] p0072 N82-12598
Cost goals for a residential photovoltaic/thermal liquid collector system set in three northern locations
[DE81-029700] p0073 N82-12610
Near-term improvements in parabolic troughs: An economic and performance assessment
[DE82-001158] p0073 N82-12615
Improvement of thermal efficiency of flat plate solar collectors
[BNPT-FB-T-80-194] p0075 N82-12642
Environmental data for sites in the National Solar Data Network
[DE82-000071] p0075 N82-12707
Dish stirling solar receiver combustor test program
[NASA-CR-165017] p0076 N82-13495
Inexpensive thermographic techniques for determining reliable solar-collector-array performance
[DE82-001151] p0076 N82-13528
Solar-central-receiver fuels and chemicals

Comparison of concepts for solar-heated or solar-driven absorption and compression cooling machines for air conditioning and food preservation purposes, phase 1
[BMFT-FB-T-81-165] p0080 N82-15541
Low-cost passive-solar retrofits for new and existing mobile homes
[DE81-028356] p0081 N82-15544
Industrial process heat applications for solar thermal technologies
[DE81-025934] p0081 N82-15545
Solar energy training program for code enforcement personnel
[DE81-030053] p0081 N82-15563
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] p0081 N82-15571
SERI Solar-Energy-Storage Program
[DE81-029476] p0082 N82-15576
Development of a modular heat exchanger with integrated latent heat energy store --- for solar heating applications
[BMFT-FB-T-81-050] p0160 N82-15584
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] p0033 N82-15613

SOLAR ENERGY ABSORBERS

Introduction to solar materials science
p0037 A82-10008
Introduction to the role of crystal defects in solar materials
p0037 A82-10009
The optical properties-microstructure relationship in particulate media - Optical tailoring of solar absorbers
p0037 A82-10011
Fundamental limits to the spectral selectivity of composite materials --- for absorbing solar radiation
p0038 A82-10015
Composite film selective-absorbers --- for solar radiation collection
p0038 A82-10016
Corrosion science and its application to solar thermal energy material problems
p0038 A82-10017
Thermal storage in salt-hydrates
p0153 A82-10018
Thermodynamic basis for selecting heat storage materials
p0153 A82-10019
Optical properties of selectively absorbing chromium films deposited at oblique angle of incidence
p0040 A82-10447
Effect of metal base layer on the absorptance and emittance of sputtered graded metal-carbon selective absorbing surfaces
p0040 A82-10469
Solution grown PbS/CdS multilayer stacks as selective absorbers
p0041 A82-10472
Calculation of the top loss coefficient by the network method and applications to solar collectors
p0056 A82-15653
Solar selective properties and high temperature stability of CVD ZrB2
p0057 A82-16055
Sputter etched metal solar selective absorbing surfaces for high temperature thermal collectors
p0057 A82-16057
An integrating sphere based on absolute method for measuring solar absorptance
p0058 A82-16247
A seasonally adjusted concentrator with modifications of absorber shape
p0059 A82-16598
Nickel sulphide-lead sulphide and nickel sulphide-cadmium sulphide selective coatings for solar thermal conversion
p0059 A82-16745
Metallurgical analysis and high temperature degradation of the black chroze solar selective absorber
p0060 A82-17252
Sputter-deposited Al2O3/Mo/Al2O3 selective absorber coatings
p0060 A82-17253
Characterization of selective solar absorber microstructures - Electron microscope studies
p0060 A82-17254
Oxidation of electrodeposited black chrome selective solar absorber films
p0060 A82-17255
Aging and corrosion problems with flat solar energy absorbers. Study based upon literature and experiment exchanges
[SP-RAPP-1979/4] p0077 N82-13548
Low-cost mirror concentrator based on inflated, double-walled, metallized, tubular films
[DE81-027813] p0081 N82-15551
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] p0160 N82-15571

SOLAR ENERGY CONVERSION

Solar materials science --- Book
p0037 A82-10007
Introduction to solar materials science
p0037 A82-10008
Introduction to the role of crystal defects in solar materials
p0037 A82-10009
Surface and interface studies and the stability of solid solar energy materials
p0037 A82-10010
Materials science issues encountered during the development of thermochemical concepts --- in screening of reactions for solar energy applications
p0038 A82-10021
The optimization of solar conversion devices
p0039 A82-10025
Photoacoustic figure of merit for photothermal energy conversion efficiency
p0121 A82-10192
Prospects for the development of solar energy in the USSR Production of electric power by thermodynamics methods
p0039 A82-10385
Some characteristics of silicon photocells fabricated by planar technology
p0039 A82-10386
Present state of research on selective coatings for solar-energy converters
p0039 A82-10387
Regime characteristics of a solar thermoelectric generator and comparison of experimental and calculated data
p0040 A82-10390

Performance analysis of d.c.-motor-photovoltaic converter system. II - Series and shunt excited motors
p0043 A82-11213

An experimental study of SC3 dissociation as a mechanism for converting and transporting solar energy
p0043 A82-11214

Plutonium thermochemical solar cell
p0043 A82-11215

Analysis of power, mass, and size parameters of solar vapor-turbine two-circuit systems with organic working bodies
p0044 A82-11421

Effect of inhomogeneous flow distribution in a system of heat-generating solar collectors
p0044 A82-11423

Efficiency of selective surfaces for solar thermal collectors
p0044 A82-11425

Solar energy technology - A five-year update
p0044 A82-11541

A solar simulator-pumped gas laser for the direct conversion of solar energy
p0044 A82-11710

High efficiency thin-film GaAs solar cells
p0046 A82-11767

Small sodium sulfur battery for solar and wind energy systems
p0047 A82-11778

A central tower solar test facility /EA/CTSTF/
p0048 A82-11797

Secondary concentrators for parabolic dish solar thermal power systems
p0048 A82-11798

Development of a solar receiver for an organic Rankine cycle engine
p0048 A82-11800

Thermionic application for future air force space power systems
p0124 A82-11822

Utilization of wind/solar energy in generating electricity in Saudi Arabia
p0049 A82-11830

Methods and problems of industrial-scale electric power generation from solar energy
p0050 A82-12506

Photovoltaics, the solar electric solution
p0050 A82-12532

Photoelectrochemical behaviour of CdS/BaI.3NH3 /liquid sodium iodide ammoniate/ junctions - Utilization in solar energy conversion
p0051 A82-12822

High-temperature solar central receivers
p0052 A82-12949

Investigation of the possibility of using inexpensive concentrating systems in the modules of a photoelectric station
p0052 A82-13713

Analysis of the optical characteristics of solar collectors
p0052 A82-13715

System of tolerances for a solar-tower power station
p0053 A82-13717

Mathematical simulation model for the operation of the optical system of a solar power station
p0053 A82-13718

Dish concentrators for solar thermal energy - Status and technology development
[AIAA PAPER 81-2530]
p0053 A82-14001

OTEC ocean system development
[AIAA PAPER 81-2590]
p0130 A82-14038

Introduction of solar energy in Saudi Arabia - A case study
p0056 A82-15660

Solar chemistry of metal complexes --- hydrogen production
p0058 A82-16124

Influence of the junction area to edge area ratio on the open-circuit voltage of silicon solar cells
p0058 A82-16133

Photoanode on the base of pheophytin-sensitized reactions
p0059 A82-16742

The use of semiconducting oxide ceramics in solar energy conversion
p0059 A82-17099

Solar-thermal experimental projects on the Spanish Plataforma Solar
p0059 A82-17128

Hydrogen from solar energy
p0085 A82-17129

Electric utility modeling extensions to evaluate solar plants
p0061 A82-18025

Quarterly report of solar federal buildings program in the BASEC region
[DE81-027968]
p0062 N82-10276

Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 N82-10490

Technical and economic assessment of solar thermophotovoltaic conversion
[DE81-803762]
p0064 N82-10515

Technological activities for high performance receivers --- for solar thermal power plants
[BMFT-FB-T-80-133]
p0066 N82-10571

User needs for solar decision-making tools: The homebuilding industry
[DE81-027293]
p0067 N82-11325

DOE solar-assisted heat-pump program: Its evolution and its potential
[DE81-026055]
p0067 N82-11413

Carlisle house: An all-solar electric residence
[DOE/ET-20279/133]
p0071 N82-11622

Passive solar technical planning study
[RPRI-EM-1591]
p0072 N82-12578

Intermediate photovoltaic system application experiment operational performance: Executive summary. Volume 1: For Newman Power Station, El Paso, Texas
[DE81-031934]
p0072 N82-12602

Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles
p0075 N82-12640

Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-166265]
p0075 N82-13039

New and renewable energy in the United States of America
[DE81-030887]
p0024 N82-13539

Market assessment of photovoltaic power systems for agricultural applications in Morocco
[NASA-CR-165477]
p0077 N82-14627

Advanced solar energy conversion --- solar pumped gas lasers
[NASA-CR-165060]
p0079 N82-15526

Solar power systems smaller than 500 W for military use
[PML-1980-06]
p0080 N82-15534

Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154]
p0080 N82-15537

Annual DOE Active Solar Heating and Cooling Contractors Review meeting
[DE81-028052]
p0081 N82-15572

Overview of active solar absorption/Rankine cooling program
[DE81-028041]
p0082 N82-15577

SOLAR FLUX
Environmental data for sites in the National Solar Data Network
[DE82-000071]
p0075 N82-12707

SOLAR FLUX DENSITY
Solar energy modulator
[NASA-CASE-NPO-15380-1]
p0063 N82-10496

Automated Fresnel lens tester system
[DE81-029483]
p0066 N82-10863

SOLAR FURNACES
Design and test of two-step solar oil shale retort
[DE82-000964]
p0077 N82-13543

SOLAR GENERATORS
Prospects for the development of solar energy in the USSR Production of electric power by thermodynamics methods
p0039 A82-10385

Regime characteristics of a solar thermoelectric generator and comparison of experimental and calculated data
p0040 A82-10390

Production of alloys of bismuth telluride for solar thermoelectric generators
p0041 A82-10471

Molten salt thermal energy storage subsystem for Solar Thermal Central Receiver plants p0047 A82-11780
A central tower solar test facility /HR/CTSTF/ p0048 A82-11797
Utilization of wind/solar energy in generating electricity in Saudi Arabia p0049 A82-11830
The effect of non-Markovian cloud patterns on the design of a regulator for a solar-powered boiler p0052 A82-13083
Material property data and their use in design and analysis for an elevated temperature solar code p0055 A82-14847
Method for calculating the unsteady temperature conditions of the generator in a solar refrigeration system p0056 A82-15642
The design of a sodium-cooled 2.7 MW receiver for a solar power plant p0059 A82-17126
Solar-thermal experimental projects on the Spanish Plataforma Solar p0059 A82-17128
Hydrogen from solar energy p0085 A82-17129
Testing and evaluation of a solar photovoltaic flywheel energy storage system [DOE/ET-20279/130] p0065 N82-10558
Study of photovoltaic cost elements. Volume 1: Executive report. Volume 2: Project background [DE81-030982] p0069 N82-11566
Passive solar technical planning study [EPRI-ER-1591] p0072 N82-12578
Comparative economics of solar thermal central receivers [DE81-029623] p0072 N82-12601
Photovoltaic market analysis program: Background, model development, applications and extensions [DE81-029711] p0073 N82-12609
Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary [DOE/SF-10601/0] p0074 N82-12624
Basis for research proposals concerning (industrial) solar energy production processes derived from biological principles p0075 N82-12640
Solar project at Almeria nears completion p0075 N82-12647
Systems analysis of thermal storage [DE81-030288] p0079 N82-14658
Energy storage systems for terrestrial solar generators --- cadmium/mercury oxide cells [BMFT-FB-T-81-082] p0080 N82-15529
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase [BMFT-FB-T-81-097] p0080 N82-15530
Development of a prototype of a 10 kW small solar power plant --- technology for developing nations [BMFT-FB-T-81-101] p0080 N82-15532
Annual DOE Active Solar Heating and Cooling Contractors Review meeting [DE81-028052] p0081 N82-15572

SOLAR HEATING
Thermal storage in salt-hydrates p0153 A82-10018
The application of reversible chemical reactions to solar thermal energy systems p0038 A82-10020
Alternative power sources for residential air-conditioning systems p0039 A82-10331
Development of a solar thermal central heat receiver using molten salt [ASME PAPER 81-SOL-2] p0041 A82-10970
Conceptual design of an advanced water/steam receiver for a solar thermal central power system [ASME PAPER 81-SOL-5] p0042 A82-10973
A novel latent heat storage for solar space heating systems - Refrigerant storage p0043 A82-11386
A simplified method for direct calculation of the annual load fraction of solar systems for space heating p0054 A82-14405
Optimization of flow passage geometry for air-heating, plate-type solar collectors p0055 A82-14846
A solar heating system with annual storage p0056 A82-15644
Thermal performance of a solar still p0058 A82-16229
Solar project description for Colorado Sunworks: Single family [DE81-028054] p0064 N82-10510
Solar project description for living systems single family residence, Davis, California [DE81-029743] p0064 N82-10511
State of the art in passive solar heating [LA-UR-81-2185] p0065 N82-10537
Los Alamos National Laboratory Passive Solar Program [DE81-028778] p0065 N82-10538
Summary of passive-solar-retrofit workshops [DE81-028146] p0065 N82-10547
Application of solar thermal energy to buildings and industry [SERI/TP-641-1222] p0066 N82-10563
The young solar collector: An evaluation of its multiple farm uses [PB81-214132] p0066 N82-10577
Solar energy system performance evaluation: Forest City Dil[illegible], Washington, D.C., January 1980 - December 1980 [DE81-028174] p0068 N82-11560
Solar energy system performance evaluation: Montecito Pines, Santa Rosa, California, November 1979 - April 1980 [DE81-028175] p0068 N82-11561
Study of photovoltaic cost elements. Volume 3: Sandia National Laboratories photovoltaic systems design catalog [DE81-030986] p0069 N82-11567
Design, cost and performance comparisons of several solar thermal systems for process heat. Volume 1: Executive summary [DE81-029881] p0069 N82-11576
Solar heat pump simulator [DE81-024368] p0070 N82-11583
Controls for solar heating and cooling [DE81-025209] p0070 N82-11593
Long-term performance of the Hunn passive solar residence [DE81-028735] p0070 N82-11600
Heat storage duration [DE81-026635] p0070 N82-11602
SOL-CICLE: A solar-assisted solvent-recycling process for asphalt-impregnation of fiber board [DE81-903377] p0070 N82-11615
Carlisle house: An all-solar electric residence [DOE/ET-20279/133] p0071 N82-11622
The Rogers focusing heliostat experimental program at Rensselaer Polytechnic Institute [PB81-226813] p0071 N82-11625
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 1: Energy-conserving design for residential structures [DE82-900206] p0017 N82-12278
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems [DE82-900207] p0071 N82-12279
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 3: Customer load management systems [DE82-900208] p0071 N82-12280
Guidebook for solar process-heat applications [DE81-027977] p0072 N82-12598
Optimization of solar heating and cooling systems [BP-1903997] p0072 N82-12599
Summertime results from the class B passive-solar performance-monitoring program [DE81-025471] p0074 N82-12627
Economic implications of passive-solar retrofit for single-family residences in Albuquerque, New Mexico: A case study [DE81-028402] p0074 N82-12630
The properties of solar and heat pump heating systems of small houses and additional heat sources [VTT-56] p0075 N82-12644
Ultimate in building energy analysis: DOE-2 and BLAST [DE81-028703] p0023 N82-13263
Fuels and chemicals made from solar energy [DE81-025018] p0077 N82-14304

HEPBAT facility. Report for May, June, July [DE81-028156] p0079 N82-14665
Solar-supplemented, natural air drying of shelled corn: The economic limitations [PB81-235681] p0079 N82-14668
Performance predictions of passive solar commercial buildings [DE81-027979] p0079 N82-15247
Low-cost passive-solar retrofits for new and existing mobile homes [DE81-028356] p0081 N82-15544
Annual DOE Active Solar Heating and Cooling Contractors Review meeting [DE81-028052] p0081 N82-15572
Incremental cooling load determination for passive direct gain heating systems [DE81-029882] p0081 N82-15575
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building [DE81-029883] p0082 N82-15578
Development of a modular heat exchanger with integrated latent heat energy store --- for solar heating applications [BMFT-FB-T-81-050] p0160 N82-15584
Supplement to energy for rural development: Renewable resources and alternative technologies for developing countries [PB81-231011] p0032 N82-15592

SOLAR HOUSES
Solar project description for Colorado Sunworks: Single family [DE81-028054] p0064 N82-10510
Testing and evaluation of a solar photovoltaic flywheel energy storage system [DOE/ET-20279/130] p0065 N82-10558
NASEC SOLAR 80 home designs [DE81-028344] p0067 N82-11316
Long-term performance of the Hunn passive solar residence [DE81-028735] p0070 N82-11600
Heat storage duration [DE81-026635] p0070 N82-11602
Carlisle house: An all-solar electric residence [DOE/ET-20279/133] p0071 N82-11622
Flexibilities in passive design: Examining some limiting solar myths [DE81-028401] p0073 N82-12623
Performance analysis of 11 Denver Metro passive homes [DE81-025473] p0074 N82-12626
Summertime results from the class B passive-solar performance-monitoring program [DE81-025471] p0074 N82-12627
The properties of solar and heat pump heating systems of small houses and additional heat sources [VTT-56] p0075 N82-12644
Appliance efficiency and the solar building [DE81-029073] p0075 N82-13265
Low-cost passive-solar retrofits for new and existing mobile homes [DE81-028356] p0081 N82-15544
Summary of passive solar multi-family design workshops [DE81-030353] p0081 N82-15564

SOLAR PONDS (HEAT STORAGE)
Modeling and testing a salt gradient solar pond in northeast Ohio p0043 A82-11210
Solar perspectives - Israel, solar pond innovator p0052 A82-12950
Thermal analysis of three zone solar pond p0054 A82-14406
Material property data and their use in design and analysis for an elevated temperature solar code p0055 A82-14847
Comparative economic performance of selected passive solar heating and cooling technologies [DE81-030220] p0072 N82-12600
SOLTECH 80 [DE81-901931] p0079 N82-14643

SOLAR POSITION
Simple tracking strategies for solar concentrations p0042 A82-11207

SOLAR POWER SATELLITES
Direct conversion of light to radio frequency energy --- using photoklystrons for solar power satellites p0045 A82-11712
Series vs. shunt regulators for power control in satellite power systems p0045 A82-11738
Cost and performance projections for SPS photovoltaic blankets p0045 A82-11741
Solar power satellite microwave power transmission and reception system p0145 A82-11743
Antenna optimization and cost consideration for the Solar Power Satellite microwave system p0145 A82-11744
Advanced Satellite Power System /SPS/ concept p0049 A82-11839
International Scientific Conference on Space, 21st, Rome, Italy, March 25, 26, 1981, Proceedings p0050 A82-12501
Mechanical and nonlinear effects in microwave power transmission p0145 A82-12504
Environmental factors of power satellites p0002 A82-12505
Transportation systems and cost comparison for launching an SPS into geosynch. orbit p0050 A82-12507
Solar power satellite system energy balance p0050 A82-12509
Chronic exposure of a honey bee colony to 2.45 GHz continuous wave microwaves p0003 A82-14347
Space chamber experiments of ohmic heating by high power microwave from the Solar Power Satellite p0145 A82-16991
Application of solar power satellites to India's energy needs - A macroengineering solution to a macroproblem p0062 A82-18645
Satellite power system: Concept development and evaluation program. Volume 4: Energy conversion and power management [NASA-TM-58237-VOL-4] p0078 N82-14634
Satellite power system: Concept development and evaluation program. Volume 7: Space transportation [NASA-TM-58238-VOL-7] p0076 N82-14635
Study of multi-megawatt technology needs for photovoltaic space power systems. Volume 1: Executive summary [NASA-CR-165323-VOL-1] p0078 N82-14636
Study of multi-megawatt technology needs for photovoltaic space power systems, volume 2 [NASA-CR-165323-VOL-2] p0078 N82-14637

SOLAR RADIATION
Performance evaluation of the solar kinetics T-700 line concentrating solar collector [NASA-CR-161856] p0063 N82-10502
Mississippi County Community College solar photovoltaic project [DE81-030669] p0068 N82-11554
SOLTECH 80 [DE81-901931] p0079 N82-14643
Use of oxide decompositions in advanced thermochemical hydrogen cycles for solar heat sources. Application of the tricobalt tetraoxide-cobalt monoxide pair [DE81-030235] p0082 N82-15581

SOLAR REFLECTORS
Dish concentrators for solar thermal energy - Status and technology development [AIAA PAPER 81-2530] p0053 A82-14001
Aplanatic double reflection system for thermophotovoltaic applications - Design p0060 A82-17293
Finite Lambertian source analysis of concentrators - Application to solar reflectors p0060 A82-17294
User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input [DE81-031920] p0073 N82-12616

SOLAR SIMULATORS
A solar simulator-pumped gas laser for the direct conversion of solar energy p0084 A82-11710
SOLAR THERMAL PROPULSION
Use of solar thermal energy to generate electricity [DE81-028777] p0070 N82-11606
Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary [DOE/SF-10601/0] p0074 N82-12624
Solar thermal energy systems [DE81-029295] p0077 N82-13531
Industrial process heat applications for solar thermal technologies [DE81-025934] p0081 N82-15545
SOLAR TOTAL ENERGY SYSTEMS
Testing of the U.S. Solar Pilot Plant receiver [ASME PAPER 81-SOL-3] p0041 A82-10971
The Texas Instruments Solar Energy System development p0047 A82-11773
An evaluation of alternate system configurations for solar repowering electric power plants p0048 A82-11803
Mathematical simulation model for the operation of the optical system of a solar power station p0053 A82-13718
Electric utility modeling extensions to evaluate solar plants p0061 A82-18025
An analytical comparison of the efficiency of solar thermal collector arrays with and without external manifolds [NASA-CR-161852] p0063 N82-10501
Solar thermal energy systems [DE81-029295] p0077 N82-13531
SOLETTAS
Contributions of space reflector technology to food production, local weather manipulation and energy supply, 1985-2020 p0054 A82-14445
SOLID ELECTRODES
Advances in coal fired MHD generator research p0126 A82-11853
Status report on MHD generator materials p0126 A82-11854
Sputtered thin film electrodes for photoelectrochemical cells p0055 A82-15111
Insoluble sulfide positive electrodes for organic electrolyte lithium secondary batteries p0155 A82-15727
Photoanode on the base of pheophytin-sensitized reactions p0059 A82-16742
The use of semiconducting oxide ceramics in solar energy conversion p0059 A82-17099
Design of a cell for electrode kinetic investigations of fuel cell reactions p0136 A82-18394
Life-testing of 1.7 kW h zinc-chloride battery system - Cycles 1 - 1000 p0155 A82-18498
SOLID PHASES
Efficient Si solar cells by low-temperature solid-phase epitaxy p0043 A82-11344
Solid-solid reactions in coal conversion processes p0107 N82-12238
SOLID STATE DEVICES
Session on solid state: Introduction p0149 N82-12565
Modified reference SPS with solid state transmitting antenna p0149 N82-12566
SPS solid state antenna power combiner p0149 N82-12567
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite p0149 N82-12568
SOLID STATE PHYSICS
Introduction to photovoltaics - Physics, materials and technology p0038 A82-10022
SOLID SURFACES
Surface and interface studies and the stability of solid solar energy materials p0037 A82-10011
Colloidally deposited high-temperature solar selective surfaces p0055 A82-15439
SOLID WASTES
Advanced system experiments facility: Solid waste to methane gas. Background and process description [DE81-030198] p0101 N82-11284
Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology [DE82-001142] p0110 N82-12596
Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1 [DE82-000808] p0019 N82-12613
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production [DE81-030671] p0021 N82-12673
Power-plant fly-ash utilization: A chemical-processing perspective [DE81-025452] p0022 N82-13191
Chemical element concentrations in liquids and solids associated with power plants using FGD systems [DE81-030422] p0027 N82-14322
Energy recovery from municipal waste development program for Idaho Falls, Idaho [DE81-029999] p0028 N82-14659
Coal conversion solid waste disposal [DE81-028567] p0116 N82-14680
SOLUBILITY
Ion exchange characteristics of enhanced oil recovery systems (miscibility studies) [DE81-769734] p0096 N82-10470
Coal hydrogenation via bonding of metallic compounds to coal, part 1. Solubilization of Illinois bituminous coal - the critical importance of methylene group cleavage, part 2 [DE81-027562] p0100 N82-11236
SOLVENT EXTRACTION
Solvent-Refined Coal (SRC) process [DE81-031937] p0106 N82-12197
Supercritical multicomponent solvent coal extraction [NASA-CASE-NPO-15767-1] p0107 N82-12241
High-pressure solvent extraction of methane from geopressured fluids [DE81-027713] p0117 N82-15227
SOLVENT REFINED COAL
Soot formation in synthetic fuel droplets [DE81-028391] p0092 N82-10150
Cryogenic methane separation/catalytic hydrogasification process analysis [DE81-029123] p0093 N82-10152
Development and application of analytical techniques to chemistry of donor solvent liquefaction [DE81-029125] p0099 N82-11166
Solvent-Refined Coal-1 Demonstration Project. Final environmental impact statement, Volume 1 of 2 --- coal liquefaction plant at Newman, Kentucky [DE81-025983] p0010 N82-11252
Process development for improved SRC options. Kerr-McGee critical solvent deashing and fractionation studies [DE81-903785] p0114 N82-14380
SOLVENTS
Investigation of mechanisms of hydrogen transfer in coal hydrogenation [DE81-030492] p0099 N82-11165
SOL-CICLE: A solar-assisted solvent-recycling process for asphalt-impregnation of fiber board [DE81-903377] p0070 N82-11615
SOOT
Synthetic-fuel combustion; pollutant formation. Soot-initiation mechanisms in burning aromatics [DE81-029480] p0093 N82-10155
Soot formation in synfuels [DE81-030273] p0099 N82-11160
Effects of components of synfuels on soot formation [DE81-027961] p0101 N82-11242

ADSORPTION
Studies of the regeneration of activated bauxite used as granular sorbent for the control of alkali vapors from hot flue gas of coal combustion
[DE81-030192] p0008 N82-10590

SOUNDING
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] p0119 N82-15656

SOUTH DAKOTA
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

SPACE CHARGE
Field nonuniformity due to photogenerated carriers in a p-i-n solar cell
p0060 A82-17650

SPACE COOLING (BUILDINGS)
Quarterly report of solar federal buildings program in the NASEC region
[DE81-027968] p0062 N82-10276
Application of solar thermal energy to buildings and industry
[SERI/TP-641-1222] p0066 N82-10563
Assessment of building diagnostics
[DE81-027078] p0012 N82-11321
Brayton/Rankine 10-ton gas-fired space conditioning system, phase 2
[PB81-223372] p0139 N82-11478
Passive solar technical planning study
[EPRI-ER-1591] p0072 N82-12578
Optimization of solar heating and cooling systems
[HP-1903997] p0072 N82-12599
Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] p0072 N82-12600
Annual cycle energy system experimental performance and national applicability
[DE81-028570] p0024 N82-13523

SPACE EXPLORATION
Highlights of 1981 activities
[NASA-NEWS-RELEASE-81-199] p0161 N82-15008

SPACE HEATING (BUILDINGS)
The application of reversible chemical reactions to solar thermal energy systems
p0038 A82-10020
A novel latent heat storage for solar space heating systems - Refrigerant storage
p0043 A82-11386
A simplified method for direct calculation of the annual load fraction of solar systems for space heating
p0054 A82-14405
Flame-retention head burner efficiency test results and analysis: Space-heating-equipment test program
[DE81-030219] p0093 N82-10153
Quarterly report of solar federal buildings program in the NASEC region
[DE81-027968] p0062 N82-10276
Solar project description for Public Service Company of New Mexico (lot 7) single family residence, Rio Rancho, New Mexico
[DE81-027853] p0063 N82-10509
Solar project description for living systems single family residence, Davis, California
[DE81-029743] p0064 N82-10511
Application of solar thermal energy to buildings and industry
[SERI/TP-641-1222] p0066 N82-10563
Energy analysis sample building data
[DE81-027188] p0011 N82-11318
Assessment of building diagnostics
[DE81-027078] p0012 N82-11321
Investigation of direct expansion in ground source heat pumps
[DE81-024139] p0012 N82-11418
Well-water-source heat pump field performance study
[DE81-024136] p0012 N82-11419
Brayton/Rankine 10-ton gas-fired space conditioning system, phase 2
[PB81-223372] p0139 N82-11478
Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] p0017 N82-12403
Passive solar technical planning study
[EPRI-ER-1591] p0072 N82-12578
Optimization of solar heating and cooling systems
[HP-1903997] p0072 N82-12599
Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] p0072 N82-12600
Summertime results from the class B passive-solar performance-monitoring program
[DE81-025471] p0074 N82-12627
Passive-solar-retrofit study for the United States Navy
[DE81-028921] p0074 N82-12629
Annual cycle energy system experimental performance and national applicability
[DE81-028570] p0024 N82-13523
Intermediate photovoltaic system application experiment operational performance report. Volume 2 for Beverly High School, Beverly, Mass.
[DE82-000811] p0077 N82-13532
Residential site design and energy conservation. Part 1: General report
[DE81-904010] p0027 N82-14398
REPEAT facility. Report for May, June, July
[DE81-028156] p0079 N82-14665
Moorhead district heating, phase 2
[DE81-029689] p0031 N82-15556
Summary of passive solar multi-family design workshops
[DE81-030353] p0081 N82-15564
Incremental cooling load determination for passive direct gain heating systems
[DE81-029802] p0081 N82-15575
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029803] p0082 N82-15578
Development of a modular heat exchanger with integrated latent heat energy store --- for solar heating applications
[BMFT-FB-T-81-050] p0160 N82-15584

SPACE MANUFACTURING
Study of multi-megawatt technology needs for photovoltaic space power systems, volume 2
[NASA-CR-165323-VOL-2] p0078 N82-14637

SPACE MISSIONS
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] p0035 N82-16022

SPACE PLASMAS
Space chamber experiments of ohmic heating by high power microwave from the Solar Power Satellite
p0145 A82-16991

SPACE POWER REACTORS
Applications of power beaming from space-based nuclear power stations
p0145 A82-11746
Development of space reactor core heat pipes
p0122 A82-11747
A compact, efficient thermoelectric module for a space reactor
p0122 A82-11749
Nuclear electric power for space systems - Technology background and flight systems program
p0123 A82-11756
Thermionic application for future air force space power systems
p0124 A82-11822
Nuclear reactor closed Brayton cycle space power conversion systems
p0126 A82-11840

SPACE POWER UNIT REACTORS
Comparative analyses of space-to-space central power stations
[NASA-TP-1955] p0150 N82-14202

SPACE PROCESSING
International Scientific Conference on Space, 21st, Rome, Italy, March 25, 26, 1981, Proceedings
p0050 A82-12501

SPACE SHUTTLE ORBITERS
Solar cell development for the Power Extension Package
p0046 A82-11763
The evaluation of four solar-array-powered multi-kW power conditioners for Space Shuttle Orbiter application
p0046 A82-11772
Satellite power system: Concept development and evaluation program. Volume 7: Space transportation
[NASA-TM-58238-VOL-7] p0078 N82-14635

SPACE SHUTTLE PAYLOADS
Solar power satellite system energy balance p0050 A82-12509
Highlights of 1981 activities [NASA-NEWS-RELEASE-81-155] p0161 N82-15008
SPACE SHUTTLES
Power management of multi-hundred kilowatt spacecraft power systems p0046 A82-11769
Highlights of 1981 activities [NASA-NEWS-RELEASE-81-155] p0161 N82-15008
SPACE SIMULATORS
Solar concentrator panel and gore testing in the JPL 25-foot space simulator [AIAA PAPER 81-2534] p0054 A82-14005
SPACE TRANSPORTATION
Satellite power system: Concept development and evaluation program. Volume 7: Space transportation [NASA-TM-58238-VOL-7] p0078 N82-14635
SPACE TRANSPORTATION SYSTEM
Transportation systems and cost comparison for launching an SPS into geosynch. orbit p0050 A82-12507
SPACECRAFT
Satellite power system: Concept development and evaluation program. Volume 7: Space transportation [NASA-TM-58238-VOL-7] p0078 N82-14635
SPACECRAFT DESIGN
High performance silicon solar arrays employing advanced structures p0045 A82-11758
SPACECRAFT LAUNCHING
Transportation systems and cost comparison for launching an SPS into geosynch. orbit p0050 A82-12507
Highlights of 1981 activities [NASA-NEWS-RELEASE-81-155] p0161 N82-15008
SPACECRAFT POWER SUPPLIES
Development status of a regenerative fuel cell system for orbital operation p0153 A82-11707
A spacecraft thermophotovoltaic power source with thermal storage p0044 A82-11711
The nickel-hydrogen battery system - An historical overview p0153 A82-11735
High power solar array switching regulation p0045 A82-11736
Ampere-hour integrator battery charge controller p0153 A82-11737
Series vs. shunt regulators for power control in satellite power systems p0045 A82-11738
Satellite power systems /SPS/ energy conversion and power management p0045 A82-11742
Engineering development testing of the GPHS-RTG converter --- General Purpose Heat Source-Radioisotope Thermoelectric Generator for Galileo orbiter power supply p0122 A82-11752
Modular isotopic thermoelectric generator p0122 A82-11753
Advances in space power research and technology at the National Aeronautics and Space Administration p0122 A82-11755
High- and low-resistivity silicon solar cells p0046 A82-11762
Solar cell development for the Power Extension Package p0046 A82-11763
Gallium arsenide solar cells-status and prospects for use in space p0046 A82-11765
GaAs solar cells for space applications p0046 A82-11766
Power management of multi-hundred kilowatt spacecraft power systems p0046 A82-11769
The evaluation of four solar-array-powered multi-kW power conditioners for Space Shuttle Orbiter application p0046 A82-11772
Multijunction high voltage concentrator solar cells p0047 A82-11796
Thermionic application for future air force space power systems p0120 A82-11822
Advanced high temperature thermoelectrics for space power p0125 A82-11823
'Thin foil cells - A challenge for space array designers' p0049 A82-11842
A technological approach towards future large solar arrays p0055 A82-11861
Space nuclear safety and fuels program p0111 N82-12921
Space applicable DOE photovoltaic technology: An update [NASA-CR-165021] p0076 N82-13491
SPACECRAFT PROPULSION
Heat pipes for NEP spacecraft radiators p0122 A82-11701
Nonimaging concentrators for photovoltaic arrays in space p0046 A82-11761
Space applicable DOE photovoltaic technology: An update [NASA-CR-165021] p0076 N82-13491
SPACECRAFT RADIATORS
Heat pipes for NEP spacecraft radiators p0122 A82-11701
SPACELAB
International Scientific Conference on Space, 21st, Rome, Italy, March 25, 26, 1981, Proceedings p0050 A82-12501
SPACETENNAS
SPS large array simulation p0071 N82-12540
SPAIN
Solar project at Almeria nears completion p0075 N82-12647
SPECTRAL EMISSION
The emissivity of metals --- frequency and temperature dependence calculations for solar collector design p0038 A82-10014
SPECTRAL REFLECTANCE
Solar mirror materials - Their properties and uses in solar concentrating collectors p0037 A82-10012
The effect of soiling on solar mirrors and techniques used to maintain high reflectivity p0037 A82-10013
Optical degradation of antireflective silica film on solar collector windows p0041 A82-10036
An integrating sphere based on absolute method for measuring solar absorptance p0058 A82-16247
Metallurgical analysis and high temperature degradation of the black chrome solar selective absorber p0060 A82-17252
SPECTRAL SENSITIVITY
Fundamental limits to the spectral selectivity of composite materials --- for absorbing solar radiation p0038 A82-10015
Composite film selective-absorbers --- for solar radiation collection p0038 A82-10016
Present state of research on selective coatings for solar-energy converters p0039 A82-10307
Spectrally selective copper sulphide coatings p0040 A82-10469
Solution grown PbS/CdS multilayer stacks as selective absorbers p0041 A82-10472
Combined solar-energy converters with selective coatings p0044 A82-11429
Efficiency of selective surfaces for solar thermal collectors p0044 A82-11425
SPECTROSCOPIC ANALYSIS
Development and application of analytical techniques to chemistry of donor solvent liquefaction [DE81-025961] p0099 N82-11167

SPECTRUM ANALYSIS
Spectra over complex terrain
[DE81-028734] p0112 N82-13473
SPECULAR REFLECTION
Solar mirror materials - Their properties and uses in solar concentrating collectors
p0037 A82-10012
The effect of soiling on solar mirrors and techniques used to maintain high reflectivity
p0037 A82-10013
SPEED CONTROL
Variable speed wind turbine control system
p0127 A82-11859
Rotor speed control by automatic yawing of two-bladed wind turbines with passive cyclic pitch variation
[AIAA PAPER 81-2570] p0129 A82-14027
Wind-energy recovery by a static Scherbius induction generator
p0131 A82-15650
Controlled Speed Accessory Drive demonstration program
[NASA-CR-165010] p0026 N82-13981
SPENT FUELS
Comparison of potential radiological consequences from a spent-fuel repository versus natural-uranium deposits
[DE81-028232] p0029 N82-14910
SPHERES
An integrating sphere based on absolute method for measuring solar absorptance
p0058 A82-16247
SPHEROMAKS
The tilting mode in field-reversed configurations --- stability of toroidal plasma equilibria
p0121 A82-11131
SPILLING
Pollution of the soil by aviation gasoline
[PBL-1979-41] p0032 N82-15596
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-028689] p0032 N82-15602
SPRAYED COATINGS
Spectrally selective copper sulphide coatings
p0040 A82-10468
SPRAYERS
Safety and technical optimization of belt transfer points with special consideration for the suppression of noxious and explosive dusts --- in coal plants
[BMFT-FB-HA-80-048] p0096 N82-10279
SPRAYING
Experimental demonstration of the feasibility of the Mist Flow Ocean Thermal Energy Process
[AIAA PAPER 81-2596] p0136 A82-18220
SPUTTERING
Effect of metal base layer on the absorptance and emittance of sputtered graded metal-carbon selective absorbing surfaces
p0040 A82-10469
Sputtered thin film electrodes for photoelectrochemical cells
p0055 A82-15111
Sputter etched metal solar selective absorbing surfaces for high temperature thermal collectors
p0057 A82-16057
Investigation of photovoltaic mechanisms in polycrystalline thin-film solar cells
[DE81-027272] p0065 N82-10539
STACKS
FGDIS primer: Major equipment/component classifications, problem/solution access codes, and definitions related to FGD systems as contained in the Flue Gas Desulfurization Information System (FGDIS)
[PB81-225948] p0016 N82-11985
STANDARDIZATION
Performance testing and rating standards for Wind Energy Conversion Systems
p0135 A82-17646
Passive/hybrid solar components: An approach to standard thermal test methods
[PB81-227886] p0077 N82-13549
STANDARDS
Standards application and development plan for solar thermal technologies
[DE81-030310] p0065 N82-10534
Intergrated assessment for energy-related environmental standards: A summary of issues and findings
[DE81-028552] p0014 N82-11646
Solar energy training program for code enforcement personnel
[DE81-030053] p0081 N82-15563
Heavy-duty engine baseline program and NO sub x emission standard development (1972-73)
[PB81-244030] p0034 N82-15621
STATIC INVERTERS
Semiconductor converters/inverters for photovoltaic power supply
p0126 A82-11857
STATIC STABILITY
The stability of a tethered gyromill
[AIAA PAPER 81-2569] p0129 A82-14026
STATISTICAL ANALYSIS
Sampling design for the 1980 commercial and multifamily residential building survey
[DE81-028783] p0011 N82-11320
National interim energy-consumption survey: Exploring the variability in energy consumption
[DE81-029910] p0018 N82-12589
STEADY STATE
Experimental evaluation of the steady-state and dynamic performance characteristics of the interactive units of a coal-gasification process
[DE81-028995] p0094 N82-10259
Transient catalytic combustor model
[NASA-CR-165324] p0142 N82-13507
STEAM
The development and design of steam/water solar receivers for commercial application
[ASME PAPER 81-SOL-4] p0042 A82-10972
Energy recovery from municipal waste development program for Idaho Falls, Idaho
[DE81-029999] p0028 N82-14659
STEAM FLOW
One-dimensional model of vapor-dominated geothermal systems
p0089 A82-11033
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523
STEAM TURBINES
Analysis of power, mass, and size parameters of solar vapor-turbine two-circuit systems with organic working bodies
p0044 A82-11421
Dynamic performance analysis for the solar hybrid repowering of the El Paso Electric Company Newman Unit No. 1
p0048 A82-11802
Thermionic combustor application to combined gas and steam turbine power plants
p0124 A82-11818
Preliminary evaluation of advanced coal-based electricity-generating technologies by means of system-integration analysis
[DE81-029989] p0105 N82-11573
Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] p0144 N82-15561
STILLS
Thermal performance of a solar still
p0058 A82-16229
Alcohol fuels grant program at Lincoln Land Community College, Springfield, Illinois
[DE82-000744] p0114 N82-14375
STIRLING CYCLE
Ground-mounted thermal storage for the parabolic dish solar collector/Stirling engine system
p0047 A82-11781
Overview of DOE's large stationary Stirling engine development program
p0123 A82-11805
Conceptual design of a large coal-fired stationary Stirling engine
p0123 A82-11806
Conceptual design of 500 to 3000 hp Stirling engines for stationary power generation
p0123 A82-11807
Development free-piston Stirling test-bed engine
p0123 A82-11808

Modelling of the jet-stream Fluidyne
p0124 A82-11812
High performance solar Stirling system
[AIAA PAPER #1-2554] p0061 A82-18222
A computer model of a stirling engine using a two-phase two-component working fluid
p0137 N82-10492
Jet impingement heat transfer enhancement for the GPU-3 Stirling engine
[NASA-TM-82727] p0140 N82-11993
Test results and facility description for a 40-kilowatt stirling engine
[NASA-TM-82620] p0141 N82-13013
Dish stirling solar receiver combustor test program
[NASA-CR-165017] p0076 N82-13495
STOICHIOMETRY
Testing and evaluation of MHD materials and substructures
[DE81-024331] p0143 N82-13926
STORAGE
Solar project description for Public Service Company of New Mexico (lot 7) single family residence, Rio Rancho, New Mexico
[DE81-027853] p0063 N82-10509
STORAGE BATTERIES
Effect of depth of discharge on cycle life of near-term batteries
p0153 A82-11714
Ampere-hour integrator battery charge controller
p0153 A82-11737
NASA preprototype redox storage system for a photovoltaic stand-alone application
p0153 A82-11774
The new batteries
p0154 A82-13325
Rechargeable lithium/vanadium oxide cells utilizing 2Me-THF/LiAsF6
p0154 A82-15726
Insoluble sulfide positive electrodes for organic electrolyte lithium secondary batteries
p0155 A82-15727
Status of the DOE battery and electrochemical technology program 2
[DE81-029879] p0156 N82-10540
Rapid charging of lead-acid batteries for electric-vehicle propulsion and solar-electric storage
[DE81-028084] p0157 N82-10548
Recent progress in lithium/iron sulfide battery development
[DE81-023127] p0157 N82-10557
Status of nickel/zinc and nickel/iron battery technology for electric vehicle applications
[DE81-023572] p0157 N82-10962
Calcium/metal sulfide battery development program
[ANL-81-14] p0158 N82-11578
Energy storage systems for terrestrial solar generators --- cadmium/mercury oxide cells
[NAFT-FB-T-81-082] p0080 N82-15529
STORAGE STABILITY
Stability of a-i-p amorphous silicon solar cells
p0043 A82-11343
Technical and economic aspects of hydrogen storage in metal hydrides
[NASA-TM-76610] p0086 N82-11223
The storage of hydrogen in the form of metal hydrides: An application to thermal engines
[NASA-TM-76609] p0086 N82-11225
Reservoir stability studies
[DE81-030099] p0160 N82-15510
STORAGE TANKS
The storage of hydrogen
p0085 A82-17130
Controls for solar heating and cooling
[DE81-025209] p0070 N82-11593
Compressed-air energy-storage technology: Program overview
[DE81-030103] p0160 N82-15548
STRATIFIED FLOW
One-dimensional model of vapor-dominated geothermal systems
p0089 A82-11033
STRATIGRAPHY
Geologic considerations in underground coal mining system design
[NASA-CR-164961] p0104 N82-11516
Stratigraphy and depositional history of the Iola Limestone Upper Pennsylvanian (Missourian), Northern Midcontinent U.S.
p0116 N82-14711
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] p0118 N82-15585
STRESS ANALYSIS
Asymmetric stress and failure analysis
[DE81-026842] p0142 N82-13451
STRESS CORROSION
Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209
STRESS RELAXATION
Relaxation of geothermal-reservoir stresses induced by heat production
[DE81-032024] p0105 N82-11715
STRINGS
Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] p0144 N82-15561
STRIP MINING
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0030 N82-15483
STRONTIUM TITANATES
Photocorrosion of strontium titanate photoanodes
p0057 A82-16056
STRUCTURAL ANALYSIS
Application of orthotropic plate theory to windmill blade design
p0121 A82-10970
STRUCTURAL BASINS
Comparison of Michigan Basin crude oils
p0091 A82-17007
Petroleum geology and resource assessment of the middle Caspian Basin, USSR, with special emphasis on the Uzen field
[DE81-029951] p0104 N82-11518
Planning a comprehensive program for exploration of the anthracite deposits of the Narragansett Basin of Massachusetts and Rhode Island, phase 1 and 2
[DE81-028490] p0104 N82-11519
STRUCTURAL DESIGN
AAI Corporation receiver design experience in concentrating solar collectors
[ASME PAPER 81-SOL-1] p0041 A82-10969
Design and testing of a uniformly illuminating nontracking concentrator
p0042 A82-11209
Heat pipes for NEP spacecraft radiators
p0122 A82-11748
Establishment of noise acceptance criteria for wind turbines
p0125 A82-11825
Optimum reinforcement shapes and paths for rotating composite shells
p0154 A82-14513
MHD generator scaling analysis for baseload commercial power plants
[AIAA PAPER 82-0394] p0135 A82-17922
Water-pumping-windmill designs: A handbook
[DE81-904016] p0137 N82-10536
Magnetohydrodynamic research program of the MHD Energy center at Mississippi State University and structural features of MHD radiant boilers
[DE81-029901] p0139 N82-11934
Flexibilities in passive design: Examining some limiting solar myths
[DE81-028401] p0073 N82-12623
DOE small-hydropower demonstration program
[DE81-027819] p0020 N82-12636
STRUCTURAL DESIGN CRITERIA
High performance silicon solar arrays employing advanced structures
p0045 A82-11758
Development of high-performance, high-reliability windpower generators
p0134 A82-17640
Earth shelter 2. 1979-1980 USC series
[CONF-800438] p0006 N82-10277
Magnetohydrodynamics MHD Engineering Test Facility ETF 200 MWe power plant. Conceptual Design Engineering Report CDER. Volume 3: Costs and schedules
[NASA-CR-165452-VOL-3] p0137 N82-10495

Designing process wells for an underground coal-gasification environment
[DE81-028434] p0108 N82-12264
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] p0140 N82-12946
Failure modes and effects analysis of a coal-slurry preheater
[DE81-030425] p0117 N82-15121

STRUCTURAL ENGINEERING
ASEC SOLAR 80 home designs
[DE81-028344] p0067 N82-11316

STRUCTURAL FAILURE
An overview of fatigue failures at the Rocky Flats Wind System Test Center p0125 A82-11828
Designing process wells for an underground coal-gasification environment
[DE81-028434] p0108 N82-12264
Asymmetric stress and failure analysis
[DE81-026842] p0142 N82-13451

STRUCTURAL PROPERTIES (GEOLOGY)
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-027799] p0118 N82-15505

STRUCTURAL RELIABILITY
Method of determining the creep characteristics of composite materials p0154 A82-11779

STRUCTURAL STRAIN
A review of rain erosion problems for aerogenerators p0130 A82-14356

STRUCTURAL VIBRATION
An overview of fatigue failures at the Rocky Flats Wind System Test Center p0125 A82-11828
Enertech High Reliability prototype vibration analysis p0133 A82-17635

SUBROUTINES
Tennessee Valley Authority atmospheric fluidized-bed combustor simulation
[DE81-030262] p0098 N82-11151

SUBSIDENCE
Computer models to support investigations of surface subsidence and associated ground motion induced by underground coal gasification
[DE81-027131] p0015 N82-11712

SUBSTRATES
Transient catalytic combustor model
[NASA-CR-165324] p0142 N82-13507

SUGAR CANE
Studies on sugarcane as an energy crop for Punjab
[PB81-232368] p0115 N82-14386

SULFATES
Dimethyl sulfate in particulate matter from coal- and oil-fired power plants p0005 A82-16199
Solid-solid reactions in coal conversion processes p0107 N82-12238

SULFITES
Sulfur pollution control. Phase 1: The disposal program (sections 5 through 7)
[PB81-222804] p0015 N82-11655

SULFONIC ACID
Evaluation of organic acids as fuel cell electrolytes p0127 A82-12938

SULFUR
The GA sulfur-iodine water-splitting process - A status report p0084 A82-11844

SULFUR DIOXIDES
Improved efficiency in the sulfur dioxide - Iodine hydrogen cycle through the use of magnesium oxide p0083 A82-11784
A computer simulation modeling study to predict air quality impacts from a 500 MW coal-fired power plant p0020 N82-12650
Kinetics of reactions in a wet flue gas simultaneous desulfurization and denitrification system
[DE81-029853] p0033 N82-15607
Use of coal cleaning for compliance with SO2 emission regulations
[PB81-247520] p0034 N82-15618

SULFUR OXIDES
An experimental study of SO3 dissociation as a mechanism for converting and transporting solar energy p0043 A82-11214
Solar hydrogen system design considerations p0084 A82-11780
Sulfur in the air in the capital (Helsinki) metropolitan area: ITASAT-project
[SR-614.71] p0025 N82-13553
Process for removing sulfur oxides from gases with direct production of a usable finished reaction product --- ammonium sulfate fertilizer
[BMFT-FB-T-81-102] p0029 N82-15142
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states
[PB81-240319] p0031 N82-15514

SULFURIC ACID
Sulfur pollution control. Phase 1: The disposal program
[PB81-222612] p0014 N82-11652
Oxydesulfurization of coal by acidic iron sulfate solutions
[DE82-000464] p0106 N82-12199

SUMMER
Summertime results from the class B passive-solar performance-monitoring program
[DE81-025471] p0074 N82-12627

SUPERCONDUCTING MAGNETS
Conceptual design of superconducting magnet system for Magnetohydrodynamic (MHD) Engineering Test Facility (ETF) 200 MWe power plant
[NASA-CR-165053] p0143 N82-14520

SUPERCONDUCTING POWER TRANSMISSION
A design for an MHD power plant as a prime mover for a Naval Vessel
[AIAA PAPER 81-2575] p0129 A82-14032
Cryogenic testing of 100-m superconducting power transmission test facility
[DE81-028331] p0150 N82-13517
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] p0150 N82-15338

SUPERCONDUCTORS
Ames Laboratory research report, 1980
[DE81-027399] p0151 N82-11012

SUPERHIGH FREQUENCIES
K/u/-band flat-profile Si-IMPATT diodes with 10-percent efficiency p0058 A82-16132

SUPPLYING
Microprocessor applications for the monitoring and control of gas supplies
[ERS-E-276] p0097 N82-10735
Electric power supply and demand for the contiguous United States, 1981 - 1990
[DE81-027126] p0012 N82-11376

SURFACE DEFECTS
Photovoltaic mechanisms in polycrystalline thin film silicon solar cells
[DE81-030370] p0072 N82-12608

SURFACE DISTORTION
Thermal deformation of concentrators in an antisymmetric temperature field p0062 A82-18698

SURFACE ENERGY
Zn3P2 as an improved semiconductor for photovoltaic solar cells
[DE81-025587] p0069 N82-11577

SURFACE PROPERTIES
Surface and interface studies and the stability of solid solar energy materials p0037 A82-10010
An integrating sphere based on absolute method for measuring solar absorptance p0058 A82-16247
Separation of particles from coal derived liquids via surface charge properties
[DE81-029088] p0092 N82-10141
Tertiary oil recovery processes research at the University of Texas
[DE81-025222] p0096 N82-10477
Spectra over complex terrain
[DE81-028734] p0112 N82-13473

SURFACE ROUGHNESS
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[NASA-TM-82726] p0141 N82-13114

SURFACE STABILITY
Surface and interface studies and the stability of solid solar energy materials p0037 A82-10010

SURFACE VEHICLES
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles p0001 A82-10495
Alternative transportation vehicles for military-base operations p0005 A82-16348

SURFACE WATER
Coal liquefaction demonstration plant near Morgantown, West Virginia; water assessment report section 13(b) [PB81-216095] p0103 N82-11269
Coal liquefaction demonstration plant near Morgantown, West Virginia: Water assessment report [PB81-216103] p0011 N82-11270
Bibliography of the seasonal thermal energy storage library [DE81-030470] p0159 N82-12586
Spectra over complex terrain [DE81-028734] p0112 N82-13473

SURFACTANTS
Ion exchange characteristics of enhanced oil recovery systems (miscibility studies) [DE81-769734] p0096 N82-10478
Microemulsions, emulsions and related systems: Energy applications p0113 N82-13545

SWIRLING
Characteristics of combustion and pollutant formation in swirling flames p0001 A82-10875
Flow aerodynamics modeling of an MHD swirl combustor - Calculations and experimental verification p0127 A82-12113

SWITCHING CIRCUITS
High power solar array switching regulation p0045 A82-11736
Series vs. shunt regulators for power control in satellite power systems p0045 A82-11738
Increasing power and efficiency by dynamic suppression of ionization instability in a plasma p0127 A82-12897

SYNCHRONOUS SATELLITES
Effects of the Satellite Power System on low Earth orbit and geosynchronous satellites [PB81-232019] p0150 N82-13157

SYNFUELS
Assessment of potential future markets for the production of hydrogen from water [BERT-PB-T-81-012] p0086 N82-12266

SYNTHESIS (CHEMISTRY)
Selectivity in Fischer-Tropsch synthesis: Review and recommendations for further work [PB81-223596] p0095 N82-10271
Catalyst and reactor development for a liquid-phase fischer-tropsch process [DE81-028209] p0099 N82-11160
An assessment of nonfossil hydrogen [PB81-246522] p0087 N82-15231

SYNTHETIC FUELS
Fingerprinting pollutant discharges from synfuels plants p0001 A82-10697
Factors in the development of a major US synthetic fuels industry p0001 A82-11543
Status report on Central Maine Power Company's DOE Funded feasibility study of the Sears Island integrated gasification combined cycle power plant p0089 A82-11835
An overview of peat gasification p0089 A82-11848
Production of synthetic crude oil from coal using the TOSCOAL pyrolysis process p0090 A82-11849
U.S. Department of Energy liquid synfuels overview p0090 A82-12531
Biomass resources for alcohol fuels p0090 A82-12533
Feasibility of solar assisted ethanol production [AIAA PAPER 81-2533] p0054 A82-14004
Alternative ocean energy products and hybrid geothermal-OTEC /GEOTEC/ plants [AIAA PAPER 81-2547] p0128 A82-14012
Soot formation in synthetic fuel droplets [DE81-028391] p0092 N82-10150
Synthetic-fuel combustion; pollutant formation. Soot-initiation mechanisms in burning aromatics [DE81-029480] p0093 N82-10155
High-mass-flux coal gasifier [DE81-029807] p0094 N82-10257
Soot formation in synfuels [DE81-030273] p0099 N82-11164
Outgassing of two synthetic fuels [AD-A104580] p0100 N82-11231
Alternative fuel for the steel industry of Northern Indiana: A prefeasibility study of a central coal gasification project [DE81-029314] p0010 N82-11233
Effects of components of synfuels on soot formation [DE81-027961] p0101 N82-11242
Advanced-gasification processes [DE81-030184] p0102 N82-11254
Fusion as a source of synthetic fuels [BNL-29281] p0086 N82-11257
Transportation fuels from synthetic gas [DE81-029614] p0102 N82-11258
Synthetic fuel development for the Upper Missouri River Basin. Section 13: Water assessment report [PB81-224537] p0011 N82-11276
Status of the Great Plains coal gasification plant [EMD-81-64] p0107 N82-12242
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols [DE82-000067] p0108 N82-12255
Synthesis gas conversion to liquid fuels using promoted fused iron catalysts [DE81-030857] p0108 N82-12259
Development of hydroconversion of biomass to synthetic fuels [DE81-030954] p0108 N82-12260
Low NO sub x heavy fuel combustor concept program [NASA-CR-165512] p0140 N82-12572
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production [DE81-030822] p0020 N82-12661
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production [DE81-030671] p0021 N82-12673
Barriers to the utilization of synthetic fuels for transportation [NASA-CR-165517] p0023 N82-13243
Feasibility study report for the Imperial Valley Ethanol Refinery: A 14.9-million-gallon-per-year ethanol synfuel refinery utilizing geothermal energy [DE82-000288] p0112 N82-13252
Potential supply of synthetic fuels from Alaskan hydroelectric power and coal [DE81-025743] p0114 N82-14381
Carcinogenic effects of coal-conversion materials [DE81-028108] p0029 N82-14803
Improved polymers for enhanced oil recovery synthesis and rheology [DE81-030194] p0118 N82-15509

SYSTEM EFFECTIVENESS
Dynamic performance analysis for the solar hybrid repowering of the El Paso Electric Company Newman Unit No. 1 p0048 A82-11802
A method for preliminary evaluation and sizing of solar thermal cogeneration system applications [AIAA PAPER 81-2551] p0054 A82-14014

SYSTEMS
Atmospheric fluidized-bed projects technology overview [DE81-027143] p0102 N82-11251

SYSTEMS ANALYSIS
Cycle and performance analysis of absorption heat pumps for waste heat utilization [DE81-030705] p0103 N82-11405
System performance conclusions p0146 N82-12539
Guidebook for solar process-heat applications [DE81-027977] p0072 N82-12598

Systems analysis of thermal storage
[DE81-030288] p0079 N82-14658
SYSTEMS ENGINEERING
Power management of multi-hundred kilowatt spacecraft power systems
p0046 A82-11769
Microwave power transmission by satellites
p0145 A82-12503
Mechanical and nonlinear effects in microwave power transmission
p0145 A82-12504
The effect of non-Markovian cloud patterns on the design of a regulator for a solar-powered boiler
p0052 A82-13083
Florida's proposed OTEC pilot plant for Key West
[AIAA PAPER 81-2563] p0003 A82-14021
The transformation of wind energy by a high altitude power plant /HAPP/
[AIAA PAPER 81-2568] p0128 A82-14025
OTEC ocean system development
[AIAA PAPER 81-2590] p0130 A82-14030
Carbonate fuel cell power plant systems
p0131 A82-15069
Wind energy conversion system design and analysis program
p0133 A82-17630
High performance solar Stirling system
[AIAA PAPER 81-2554] p0061 A82-18222
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 9: Design approaches, CAES. Appendix D: Mechanical systems
[DE81-028200] p0156 N82-10530
Intermediate photovoltaic-system application experiment operational performance report. Volume 1: For Lovington Square Shopping Center site, Lovington, New Mexico
[DE81-028971] p0065 N82-10543
Solar photovoltaic system engineering perspectives
[DE81-023179] p0066 N82-10570
Conceptual design for a multi-user medium BTU coal gasification complex. Volume 1: Executive summary
[DE81-027139] p0101 N82-11238
DOE solar-assisted heat-pump program: Its evolution and its potential
[DE81-026055] p0067 N82-11413
Geologic considerations in underground coal mining system design
[NASA-CR-164961] p0104 N82-11516
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] p0140 N82-12446
Design and breadboard evaluation of the SPS reference phase control system concept
p0072 N82-12545
Flexibilities in passive design: Examining some limiting solar myths
[DE81-028401] p0073 N82-12623
Solar project at Almeria nears completion
p0075 N82-12647
Seminars for private college administrators on solar applications for college buildings
[DE81-027981] p0079 N82-14661
Development of a prototype of a 10 kW small solar power plant --- technology for developing nations
[DRFT-FB-T-81-101] p0080 N82-15532
Technology of controlled nuclear fusion

Near-term batteries for electric vehicles
[DE81-023543] p0157 N82-10556
Assessment of advanced coal gasification processes
[NASA-CR-164949] p0098 N82-11146

Jet fuel tests to shale oil: The 1980 technology review
[AD-A106414] p0100 A82-11228
Low/medium-Btu coal-gasification assessment program for specific sites of two New York utilities
[DE81-025518] p0101 A82-11240
Assessment of oil-shale technology in Brazil
[DE81-027574] p0010 A82-11249
Atmospheric fluidized-bed projects technology overview
[DE81-027143] p0102 A82-11251
Advanced-gasification processes
[DE81-030184] p0102 A82-11254
Alcohol fuels in the United States
[DE81-026013] p0010 A82-11265
Gas recovery from coal deposits
[PB81-222291] p0103 A82-11271
Mechanical Energy Storage Technology (MEST) development
[DE81-026800] p0158 A82-11596
An assessment of selected solar energy industry activities
[PB81-222424] p0071 A82-11623
Assessment of pulverized-coal-fired combustor performance
[DE81-030060] p0105 A82-12187
Extensible bridge-conveyor concepts for coal-mine face haulage
[DE81-031974] p0146 A82-12525
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays
p0148 A82-12559
Session on solid state: Introduction
p0149 A82-12565
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] p0019 A82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study
[DE81-904236] p0019 A82-12594
Modelling energy-economic interactions in developing countries: A linear-programming approach
[DE81-026048] p0020 A82-12637
Technology characterizations: Environmental information handbook, second edition
[DE81-029993] p0021 A82-12671
Soviet UCG experience specifically related to field experiments in the United States
[DE81-028642] p0111 A82-13244
Distributed photovoltaic systems: Utility interface issues and their present status
[NASA-CR-165019] p0076 A82-13492
Health and safety research division
[DE81-026088] p0026 A82-13652
Study of multi-megawatt technology needs for photovoltaic space power systems. Volume 1: Executive summary
[NASA-CR-165323-VOL-1] p0078 A82-14636
Study of multi-megawatt technology needs for photovoltaic space power systems, volume 2
[NASA-CR-165323-VOL-2] p0078 A82-14637
Potential energy savings in the residential sector of the United States
[DE81-028873] p0028 A82-14662
US ceramic heat exchanger technology: Status and opportunities
[DE81-029686] p0030 A82-15210
Micro-hydropower in the United States
[DE81-028271] p0031 A82-15567
Technology of controlled nuclear fusion
[DE81-027361] p0144 A82-15893
Evaluating R and D options under uncertainty. Volume 2: Atmospheric fluidized-bed combustion commercialization strategies
[DE81-904246] p0035 A82-16012

TECHNOLOGY TRANSFER
Overview of the applied battery and electrochemical research program
[DE81-027397] p0158 A82-11594

TECHNOLOGY UTILIZATION
Solar energy technology - A five-year update
p0044 A82-11541
Techniques and applications of pulsed power technology
p0153 A82-11722
Photovoltaics, the solar electric solution
p0050 A82-12532
Industrial applications of MHD high temperature air heater technology
[AIAA PAPER 81-2586] p0138 A82-14037
Technological innovation for success - Liquid hydrogen propulsion
p0084 A82-14734
Possible application of electromagnetic guns to inject fusion
p0135 A82-14891
Market assessment of photovoltaic power systems for agricultural applications in Mexico
[NASA-CR-165441] p0007 A82-15506
Environmental compliance program handbook
[DE81-030226] p0008 A82-15585
Investigation of the application of remote sensing technology to environmental monitoring
[E82-10010] p0030 A82-15688
Technology of controlled nuclear fusion
[DE81-027361] p0144 A82-15893

TELEVISION RECEIVERS
Appliance efficiency and the solar building
[DE81-029073] p0075 A82-13245

TELLURIC CURRENTS
Geomagnetic and magnetotelluric soundings in the area of the Central European rift system
[BMFT-FB-T-81-111] p0119 A82-15656

TEMPERATURE CONTROL
The effect of non-Markovian cloud patterns on the design of a regulator for a solar-powered boiler
p0052 A82-13083

TEMPERATURE DEPENDENCE
The emissivity of metals --- frequency and temperature dependence calculations for solar collector design
p0038 A82-10014
Temperature dependence of the short-circuit current in MIS solar cells
p0052 A82-12825
Dependence of minority carrier diffusion length on illumination level and temperature in single crystal and polycrystalline Si solar cells
p0053 A82-13804

TEMPERATURE DISTRIBUTION
Method for calculating the unsteady temperature conditions of the generator in a solar refrigeration system
p0056 A82-15642

TEMPERATURE EFFECTS
A study of factors influencing thermally induced backfiring in hydrogen fueled engines, and methods for backfire control
p0084 A82-11791
Effect of wick dryness on the performance of heat pipes with separate channels
p0005 A82-16272
Thermal deformation of concentrators in an antisymmetric temperature field
p0062 A82-18690

TEMPERATURE GRADIENTS
Experimental demonstration of the feasibility of the Mini Flow Ocean Thermal Energy Process
[AIAA PAPER 81-2596] p0136 A82-18220
Heat flow studies and geothermal exploration in western Trans-Pecos Texas
p0110 A82-12684

TEMPERATURE MEASUREMENT
Inexpensive thermographic techniques for determining reliable solar-collector-array performance
[DE82-001151] p0076 A82-13520

TEMPERATURE MEASURING INSTRUMENTS
Inexpensive thermographic techniques for determining reliable solar-collector-array performance
[DE82-001151] p0076 A82-13520

TENNESSEE
Evaluation of Devonian shale potential in eastern Kentucky/Tennessee
[DE82-001164] p0116 A82-14595

TERMINAL FACILITIES
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
[DE81-029833] p0022 A82-13014

TERRAIN ANALYSIS
Spectra over complex terrain
[DE81-028734] p0112 A82-13473

TEST EQUIPMENT
Method of determining the creep characteristics of composite materials
p0154 A82-11779
TEST FACILITIES
Correlation between results of zone method and experiment in radiative heat transfer
[ASME PAPER 81-81-71] p0121 A82-10958
A central tower solar test facility /HM/CIEMAT/
p0048 A82-11797
Evaluation of wind turbine generator operational hysteresis using 'Method of Bins'
p0133 A82-17636
Hall region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design --- Engineering Test Facility
[AIAA PAPER 82-0325] p0135 A82-17889
Impact of uniform electrode current distribution on ETF --- Engineering Test Facility MHD generator
[AIAA PAPER 82-0423] p0135 A82-17941
Magnetohydrodynamics MHD Engineering Test Facility ETF 200 MWe power plant. Conceptual Design Engineering Report CDER. Volume 3: Costs and schedules
[NASA-CR-165052-VOL-3] p0137 N82-10495
Lewis Research Center's coal-fired, pressurized, fluidized-bed reactor test facility
[NASA-TM-81616] p0103 N82-11397
Magnetohydrodynamic research program of the MHD Energy center at Mississippi State University and structural features of MHD radiant boilers
[DE81-029901] p0139 N82-11934
Magnetohydrodynamics (MHD) Engineering Test Facility (ETF) 200 MWe power plant. Design Requirements Document (DRD)
[NASA-TM-82705] p0140 N82-12446
Residual-energy-application program: EAST facility requirements document, volume 1
[DE81-027536] p0142 N82-13526
Testing and evaluation of MHD materials and substructures
[DE81-024331] p0143 N82-13926
Sixth Underground Coal-Conversion Symposium
[DE81-027669] p0114 N82-14374
TETHERED BALLOONS
The transformation of wind energy by a high altitude power plant /HAPP/
[AIAA PAPER 81-2568] p0128 A82-14025
TEXAS
Heat flow studies and geothermal exploration in western Trans-Pecos Texas
p0110 N82-12684
Assessment of in-place solution methane in tertiary sandstones: Texas Gulf Coast
[DE81-029772] p0117 N82-15225
Structural evolution of three geopressured-geothermal areas in the Texas Gulf Coast
[DE81-029799] p0118 N82-15505
THERMAL ABSORPTION
Fundamental limits to the spectral selectivity of composite materials --- for absorbing solar radiation
p0038 A82-10015
Corrosion science and its application to solar thermal energy material problems
p0038 A82-10017
Improvement of thermal efficiency of flat plate solar collectors
[BMFT-FB-T-80-194] p0075 N82-12642
THERMAL CONDUCTIVITY
Material property data and their use in design and analysis for an elevated temperature solar code
p0055 A82-14847
Measurement of thermal conductivities in coal fluids
[DE82-000523] p0109 N82-12400
THERMAL DECOMPOSITION
Parametric study of the cadmium thermoelectrochemical hydrogen cycle
p0083 A82-11785
Solar hydrogen system design considerations
p0084 A82-11788
The GA sulfur-iodine water-splitting process - A status report
p0084 A82-11844
Experimental evaluation of the steady-state and dynamic performance characteristics of the interactive units of a coal-gasification process
[DE81-028995] p0094 N82-10259
Pyrolytic characterization of the organic matter in selected coals and in the Devonian shales of southern West Virginia
p0113 N82-13578
THERMAL DEGRADATION
Metallurgical analysis and high temperature degradation of the black chrome solar selective absorber
p0060 A82-17252
THERMAL DISSOCIATION
Thermolysis of naphthols
[DE81-029684] p0116 N82-15152
THERMAL ENERGY
Ground-mounted thermal storage for the parabolic dish solar collector/Stirling engine system
p0047 A82-11781
Dish concentrators for solar thermal energy - Status and technology development
[AIAA PAPER 81-2530] p0053 A82-14001
A method for preliminary evaluation and sizing of solar thermal cogeneration system applications
[AIAA PAPER 81-2551] p0054 A82-14014
Solar-thermal experimental projects on the Spanish Plataforma Solar
p0059 A82-17128
A computer model of a stirling engine using a two-phase two-component working fluid
p0137 N82-10492
Cooperative program of applied energy research technology development
[DE81-029916] p0007 N82-10517
Review of simulation techniques for Aquifer Thermal Energy Storage (ATES)
[DE81-029943] p0156 N82-10532
Standards application and development plan for solar thermal technologies
[DE81-030310] p0065 N82-10534
Site And Neighborhood Design (SAND): Development of simplified automated building thermal load procedures, phase 1
[DE81-027138] p0011 N82-11317
Analysis of thermal/mechanical energy-conversion concepts
[DE81-027854] p0139 N82-11585
Use of solar thermal energy to generate electricity
[DE81-028797] p0070 N82-11606
Study of ATES thermal behavior using a steady flow model
[DE81-030883] p0159 N82-12396
Solar thermal central receivers for industrial process heat generation: User views and recommendations for commercialization
[DE81-029611] p0073 N82-12618
Department of Energy Solar Central Receiver Semiannual Meeting
[SAND-80-8049] p0074 N82-12632
Geothermal-resource verification for Air Force Bases
[DE81-027482] p0112 N82-13520
Residual-energy-application program: EAST facility requirements document, volume 1
[DE81-027536] p0142 N82-13526
Industrial process heat applications for solar thermal technologies
[DE81-025934] p0081 N82-15545
SERI Solar-Energy-Storage Program
[DE81-029476] p0082 N82-15576
THERMAL EXPANSION
Thermal deformation of concentrators in an antisymmetric temperature field
p0062 A82-18698
THERMAL INSULATION
An analytical comparison of the efficiency of solar thermal collector arrays with and without external manifolds
[NASA-CR-161852] p0063 N82-10501
Comparative thermal performance of direct gain, Trombe, and sunspace walls
[DE81-030546] p0081 N82-15571
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] p0160 N82-15579
THERMAL MAPPING
Heat flow studies and geothermal exploration in western Trans-Pecos Texas
p0110 N82-12684
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cabeza Prieta, Arizona, and Yellowstone National Park
[N82-10011] p0118 N82-15489

THERMAL NOISE
Thermoelectric conversions based on noise rectification
p0138 N82-10936
THERMAL RADIATION
A spacecraft thermophotovoltaic power source with thermal storage
p0044 A82-11711
THERMAL RESISTANCE
Sputter etched metal solar selective absorbing surfaces for high temperature thermal collectors
p0057 A82-16057
THERMAL RESOURCES
Industrial process heat applications for solar thermal technologies
[DE81-025934] p0081 N82-15545
THERMAL STABILITY
Solar selective properties and high temperature stability of CVD ZrB2
p0057 A82-16055
Mechanically stable hydride composites designed for rapid cycling
p0084 A82-16347
THERMAL STRESSES
Relaxation of geothermal-reservoir stresses induced by heat production
[DE81-032024] p0105 N82-11715
Workshop proceedings: U-bend tube cracking in steam generators
[DE81-903765] p0142 N82-13515
Cool-down flow-rate limits imposed by thermal stresses in LNG pipelines
[DE81-028731] p0150 N82-14484
THERMALIZATION (ENERGY ABSORPTION)
Cycle and performance analysis of absorption heat pumps for waste heat utilization
[DE81-030705] p0103 N82-11405
Chemical heat pump program: An overview
[DE81-025086] p0012 N82-11414
THERMIONIC CONVERTERS
Thermionic combustor application to combined gas and steam turbine power plants
p0124 A82-11818
Characteristics of CVD silicon carbide thermionic converters
p0124 A82-11821
High thermal power density heat transfer --- thermionic converters
[NASA-CASE-LEW-12950-1] p0139 N82-11399
Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-166265] p0075 N82-13039
THERMIONIC POWER GENERATION
High temperature cogeneration with thermionic burners
p0124 A82-11817
Thermionic application for future air force space power systems
p0124 A82-11822
The plasmadynamics and ionization kinetics of thermionic energy conversion
p0137 N82-10494
THERMOCHEMICAL PROPERTIES
Plutonium thermochemical solar cell
p0043 A82-11215
Use of oxide decompositions in advanced thermochemical hydrogen cycles for solar heat sources. Application of the tricobalt tetraoxide-cobalt monoxide pair
[DE81-030235] p0082 N82-15581
THERMOCHEMISTRY
Materials science issues encountered during the development of thermochemical concepts --- in screening of reactions for solar energy applications
p0038 A82-10021
Mass spectrometric studies of MHD slag thermochemistry
[PB81-221434] p0138 N82-11173
Chemical heat pump program: An overview
[DE81-025086] p0012 N82-11414
Thermochemical production of liquids from biomass
[DE81-030085] p0117 N82-15226
SERI Solar-Energy-Storage Program
[DE81-029476] p0082 N82-15576
THERMODYNAMIC CYCLES
Regenerative pyroelectric heat engine
p0126 A82-11833
On the efficiency of thermal engines with power output - Harmonically driven engines
p0131 A82-14469
Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] p0074 N82-12626
THERMODYNAMIC EFFICIENCY
The economic implications of the exergy and thermal efficiencies of energy conversion systems
p0121 A82-11782
Development free-piston Stirling test-bed engine
p0123 A82-11800
The GA sulfur-iodine water-splitting process - A status report
p0084 A82-11844
Aquifer thermal energy storage - A feasibility study for large scale demonstration
p0154 A82-11846
Effect of wick dryness on the performance of heat pipes with separate channels
p0005 A82-16272
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design --- Engineering Test Facility
[AIAA PAPER 82-0325] p0135 A82-17889
An analytical comparison of the efficiency of solar thermal collector arrays with and without external manifolds
[NASA-CR-161852] p0063 N82-10501
Technological activities for high performance receivers --- for solar thermal power plants
[BMFT-FB-T-80-133] p0066 N82-10571
Evaluation of the micro-carburetor
[NASA-CR-164958] p0016 N82-11994
Optimization of solar heating and cooling systems
[NP-1903997] p0072 N82-12599
Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] p0074 N82-12625
Improvement of thermal efficiency of flat plate solar collectors
[BMFT-FB-T-80-194] p0075 N82-12642
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design
[NASA-TM-82744] p0141 N82-12943
Evaluation of coal gasification/combined cycle power plant feasibility at the Sewells Point Naval Complex, Norfolk, Virginia
[AD-A109674] p0116 N82-14639
Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154] p0080 N82-15537
Project DEEP STEAM: Fourth meeting of the technical advisory panel
[DE81-029457] p0144 N82-15561
THERMODYNAMIC PROPERTIES
Thermodynamic basis for selecting heat storage materials
p0153 A82-10019
Reduced heat flow - Mean heat flow relationship for the continental geothermal provinces
p0089 A82-10372
Thermophysical properties of coal liquids
[DE81-027944G] p0097 N82-10838
Development of a thermodynamic properties correlation framework for the coal conversion industry, phase 1A
[DE81-030363] p0111 N82-12985
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] p0160 N82-15579
THERMODYNAMICS
Materials science issues encountered during the development of thermochemical concepts --- in screening of reactions for solar energy applications
p0038 A82-10021
Prospects for the development of solar energy in the USSR Production of electric power by thermodynamics methods
p0039 A82-10385
Measured performance of falling-jet flash evaporators
[DE81-024355] p0161 N82-10565
Study of ATES thermal behavior using a steady flow model
[DE81-030883] p0159 N82-12996

Theoretical basis of the DOE-2 building energy use analysis program
[DE81-028896] p0030 N82-15242
Technology of controlled nuclear fusion
[DE81-027361] p0144 N82-15893
THERMOELECTRIC COOLING
A thermoelectric refrigerator powered by photovoltaic solar collectors
p0049 A82-11856
THERMOELECTRIC GENERATORS
Engine characteristics of a solar thermoelectric generator and comparison of experimental and calculated data
p0040 A82-10390
Production of alloys of bismuth telluride for solar thermoelectric generators
p0041 A82-10471
Combined solar-energy converters with selective coatings
p0044 A82-11424
A compact, efficient thermoelectric module for a space reactor
p0122 A82-11749
Engineering development testing of the GPHS-RTG converter --- General Purpose Heat Source-Radioisotope Thermoelectric Generator for Galileo orbiter power supply
p0122 A82-11752
Modular isotopic thermoelectric generator
p0122 A82-11753
Nuclear electric power for space systems - Technology background and flight systems program
p0123 A82-11756
Methods and problems of industrial-scale electric power generation from solar energy
p0050 A82-12506
Thermoelectric conversions based on noise rectification
p0138 N82-10936
Controls for solar heating and cooling
[DE81-025209] p0070 N82-11593
Study of radiatively sustained cesium plasmas for solar energy conversion
[NASA-CR-166265] p0075 N82-13039
Environmental and radiological safety studies: Interaction of (238) PuO2 heat sources with terrestrial and aquatic environments
[DE81-032019] p0025 N82-13565
THERMOELECTRIC MATERIALS
Production of alloys of bismuth telluride for solar thermoelectric generators
p0041 A82-10471
Material property data and their use in design and analysis for an elevated temperature solar code
p0055 A82-14847
THERMOELECTRIC POWER GENERATION
Advanced high temperature thermoelectrics for space power
p0125 A82-11823
Applications of thermoelectrics to geothermal energy conversion
p0125 A82-11824
Towards a high-temperature solar electric converter
p0056 A82-15903
Thermoelectric conversions based on noise rectification
p0138 N82-10936
THERMOHYDRAULICS
Effect of inhomogeneous flow distribution in a system of heat-generating solar collectors
p0044 A82-11423
Geothermal systems: Principles and case histories --- Book
p0090 A82-12275
A simplified model of the thermohydraulic behaviour of a linear collector network for the conversion of the solar energy
p0062 A82-18816
Technology of controlled nuclear fusion
[DE81-027361] p0144 N82-15893
THERMONUCLEAR REACTIONS
Uncertainties associated with inertial-fusion ignition
[DE81-025408] p0139 N82-11944
THICK FILMS
Effects of processing parameters on thick film inks used for solar cell front metallization
p0058 A82-16474
Development of an all-metal thick film cost effective metallization system for solar cells
[NASA-CR-165043] p0078 N82-14630
THICKNESS
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[NASA-TM-82726] p0141 N82-13114
THIN FILMS
Heterojunctions for thin film solar cells
p0039 A82-10024
Thin cells - Their present status and future areas of development
p0046 A82-11764
High efficiency thin-film GaAs solar cells
p0046 A82-11767
Advances in photovoltaics R&D - An overview
p0047 A82-11793
'Thin foil cells - A challenge for space array designers'
p0049 A82-11842
Progress in large area photovoltaic devices based on amorphous silicon alloys
p0049 A82-11855
A numerical model of a graded band gap CdS/x/Te/1-x/ solar cell
p0050 A82-12817
Preparation and properties of graded band gap CdS/x/Te/1-x/ thin film solar cells
p0051 A82-12818
Series resistance effects in 20 sq cm indium tin oxide-polycrystalline silicon solar cells
p0051 A82-12819
Thin-film gallium arsenide homojunction solar cells
p0052 A82-13200
A new low temperature III-V multilayer growth technique - Vacuum metalorganic chemical vapor deposition --- of GaAs thin films
p0053 A82-13803
Sputtered thin film electrodes for photoelectrochemical cells
p0055 A82-15111
Photoelectrochemical cells using polycrystalline and thin film MoS2 electrodes
p0057 A82-16053
Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 N82-10490
Thin film photovoltaic devices
p0063 N82-10491
Investigation of photovoltaic mechanisms in polycrystalline thin-film solar cells
[DE81-027272] p0065 N82-10539
Controlled cadmium telluride thin films for solar-cell applications
[DE81-023275] p0066 N82-10569
Amorphous boron-silicon-hydrogen alloys for thin-film heterojunction solar cells
[DE81-027254] p0068 N82-11558
Impurity effects in a-Si:H solar cells
[DE81-025069] p0069 N82-11575
Low-cost solar flat-plate-collector development
[DE81-025081] p0070 N82-11584
Photoelectrochemical solar cells: Stabilization of small-band-gap semiconductor in aqueous solution by surface-attached organic conducting polymer
[DE81-030312] p0081 N82-15569
THROTTLING
External fuel vaporization study
[NASA-CR-165513] p0114 N82-14371
TIDE POWERED GENERATORS
North American tidal power prospects
p0131 A82-15667
TIDEPOWER
International Symposium on Wave and Tidal Energy, 2nd, St. John's College, Cambridge, England, September 23-25, 1981, Proceedings
p0135 A82-18124
Ocean energy-waves, currents, and tides
[DE81-025708] p0105 N82-11611
TIMBER INVENTORY
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604

TIME SERIES ANALYSIS
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] p0119 N82-15560
TIN COMPOUNDS
Coal hydrogenation via bonding of metallic compounds to coal, part 1. Solubilization of Illinois bituminous coal - the critical importance of methylene group cleavage, part 2
[DE81-027562] p0100 N82-11236
TIN OXIDES
Series resistance effects in 20 sq cm indium tin oxide-polycrystalline silicon solar cells
p0051 A82-12819
n-/indium tin oxide//p-InP solar cells
p0056 A82-16471
Optimization of transparent electrode for solar cells
[DE81-023359] p0063 N82-10507
TIP SPEED
Methodology for the evaluation of aerodynamic performance and rotor optimization under constant RPMoperation
[AIAA PAPER 81-2560] p0128 A82-14019
TITANIUM OXIDES
Sputtered thin film electrodes for photoelectrochemical cells
p0055 A82-15111
TOKAMAK DEVICES
RF-driven Tokamak reactor with sub-ignited, thermally stable operation
[DE81-029437] p0139 N82-11935
TOLERANCES (MECHANICS)
System of tolerances for a solar-tower power station
p0053 A82-13717
TOLUENE
Supercritical multicomponent solvent coal extraction
[NASA-CASE-NPO-15767-1] p0107 N82-12241
Measurement of thermal conductivities in coal fluids
[DE82-000523] p0109 N82-12400
TOPOGRAPHY
Geologic considerations in underground coal mining system design
[NASA-CR-164961] p0104 N82-11516
TORNADOES
A numerical model for the flow within the tower of a tornado-type wind energy system
p0131 A82-14844
TOROIDAL PLASMAS
The tilting mode in field-reversed configurations --- stability of toroidal plasma equilibria
p0121 A82-11131
TORQUE
Analytical solution of a simulation model for wind turbines
p0132 A82-16600
TOTAL ENERGY SYSTEMS
Develop and test fuel cell powered on-site integrated total energy system. Phase 3: Full-scale power plant development
[NASA-CR-165328] p0142 N82-13490
TOWERS
A central tower solar test facility /SB/CTSTF/
p0048 A82-11797
Gas cooled solar power plant for generating electrical energy in the 20MWe operating range (GAST): Preliminary design phase
[BMFT-FB-T-81-097] p0080 N82-15530
TOXIC HAZARDS
Outgassing of two synthetic fuels
[AD-A104580] p0100 N82-11231
Low-Btu-gasifier emissions toxicology
[DE81-031000] p0014 N82-11651
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic fuels production
[DE81-030022] p0020 N82-12661
Environmental hazard rankings of pollutants generated in coal gasification processes
[PB81-231698] p0026 N82-13576
TOXICITY
Identification and toxicity of fractionated-shale-oil components
[DE81-028460] p0021 N82-12766
TRACE ELEMENTS
Chemical element concentrations in liquids and solids associated with power plants using FGD systems
[DE81-030422] p0027 N82-14322
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-230479] p0034 N82-15624
TRACKING (POSITION)
Simple tracking strategies for solar concentrators
p0042 A82-11207
TRACKING STATIONS
An optimization model for energy generation and distribution in a dynamic facility
p0011 N82-11310
TRACTION
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] p0159 N82-12945
TRACTORS
Energy consumption and heavy-duty vehicles --- tractor trucks
p0008 N82-10573
TRAFFIC CONTROL
Measures of effectiveness of transportation systems management
[PB81-233844] p0026 N82-13984
TRAINING ANALYSIS
Education and training implications of biomass energy system use
[DE81-029956] p0028 N82-14664
TRAJECTORY OPTIMIZATION
Fuel efficient flight profiles in an ATC flow management environment
p0002 A82-13078
TRANSFER OF TRAINING
Solar energy training program for code enforcement personnel
[DE81-030053] p0081 N82-15563
TRANSFER ORBITS
Comparative analyses of space-to-space central power stations
[NASA-TP-1955] p0150 N82-14202
TRANSIENT RESPONSE
Load-change testing of a large commercial oxygen plant
[EPRI-NP-1824] p0096 N82-10275
Transient catalytic combustor model
[NASA-CR-165324] p0142 N82-13507
TRANSISTOR AMPLIFIERS
Solid-state retrodirective phased array concepts for microwave power transmission from Solar Power Satellite
p0149 N82-12568
TRANSITION FLOW
Flow in geothermal wells. Part 8: Transition criteria for two-phase flow patterns
[DE81-028312] p0096 N82-10366
TRANSITION METALS
Desulfurization with transition metal catalysts
[DE81-028935] p0092 N82-10143
TRANSMISSION EFFICIENCY
Efficiency of Fresnel lenses
p0043 A82-11307
Solar power satellite microwave power transmission and reception system
p0145 A82-11743
Considerations for high accuracy radiation efficiency measurements for the Solar Power Satellite (SPS) subarrays
p0148 N82-12559
TRANSMISSION LOSS
Improved technique to measure electronically AC losses in superconducting cables
[DE81-029323] p0150 N82-15330
TRANSMISSIONS (MACHINE ELEMENTS)
Design study of a continuously variable roller cone traction CVT for electric vehicles
[NASA-CR-159841] p0159 N82-12945
TRANSMITTER RECEIVERS
Design and breadboard evaluation of the SPS reference phase control system concept
p0072 N82-12545
TRANSMITTERS
Coherent multiple tone technique for ground based SPS phase control
p0147 N82-12546

TRANSPORT AIRCRAFT
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles
p0001 A82-10455
Fuel for future transport aircraft
[ASME PAPER 81-ET-80] p0089 A82-10965
Wing design for light transport aircraft with improved fuel economy
p0004 A82-10416
Liquid hydrogen - An outstanding alternate fuel for transport aircraft
p0085 A82-17290
TRANSPORT PROPERTIES
Bounds and exact theories for the transport properties of inhomogeneous media
p0056 A82-15607
Transport characteristics of alternate slurry fuels
[DE81-028580] p0146 N82-11255
TRANSPORTATION
Barriers to the utilization of synthetic fuels for transportation
[NASA-CR-165517] p0023 N82-13243
Measures of effectiveness of transportation systems management
[PB81-233884] p0026 N82-13984
TRANSPORTATION ENERGY
Lightweight hydrides for automotive storage of hydrogen
p0084 A82-11790
Energy conservation through utilization of mechanical energy storage
p0002 A82-11845
An energy saving transit concept for new towns
p0005 A82-15665
Alternative transportation vehicles for military-base operations
p0005 A82-16348
Technological innovation for success - Liquid hydrogen propulsion
p0084 A82-16734
Fundamental investigations on fuel cells for transportation applications
p0137 N82-10493
Mechanical energy storage technology project
[DE81-029753] p0155 N82-10508
Measures of effectiveness of transportation systems management
[PB81-233884] p0026 N82-13984
TREES (MATHEMATICS)
Value tree analysis of energy supply alternatives
[AD-A105629] p0029 N82-14875
TRINIDAD AND TOBAGO
Venezuela, Trinidad and Tobago: Crude oil potential from known deposits
[DE81-027023] p0096 N82-10474
TRITIUM
Hydrogen storage-bed design for tritium systems test assembly
[DE81-025336] p0086 N82-11262
TROMBE WALLS
Comparative economic performance of selected passive solar heating and cooling technologies
[DE81-030220] p0072 N82-12600
Transwall: A modular visually transmitting thermal storage wall
[DE81-029821] p0160 N82-15579
TROUGHS
Frequency response analysis of fluid control systems for parabolic-trough solar collectors
[DE81-029293] p0064 N82-10513
TRUCKS
Energy consumption and heavy-duty vehicles --- tractor trucks
p0008 N82-10573
TUBE HEAT EXCHANGERS
Dish stirling solar receiver combustor test program
[NASA-CR-165017] p0076 N82-13495
Development of a modular heat exchanger with integrated latent heat energy store --- for solar heating applications
[BMFT-FB-T-81-050] p0160 N82-15584
TURBINE BLADES
A vertical axis cyclogiro type wind-turbine with freely-hinged blades
p0125 A82-11829
Rotor speed control by automatic yawing of two-bladed wind turbines with passive cyclic pitch variation
[AIAA PAPER 81-2570] p0129 A82-14027
An aeroelastic analysis of the Darrieus wind turbine
[AIAA PAPER 81-2572] p0129 A82-14029
Computational analysis of diffuser-augmented wind turbines
p0132 A82-16743
Enertech High Reliability prototype vibration analysis
p0133 A82-17635
First results from the UMass wind tunnel test progr.m --- for windpowered generator optimization
p0134 A82-17643
Performance of a small low speed Darrieus type rotor
p0136 A82-18328
An indoor blade test facility for determining the basic aerodynamic properties of Darrieus wind turbine airfoils with test results for an NACA 0015 and a modified section
p0136 N82-10005
Residual stresses in darrieus vertical axis wind turbine blades
[DE81-1026144] p0136 N82-10434
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine
[NASA-TM-82726] p0141 N82-13114
Update on Specified European R and D Efforts. Part 1: Appendices
[DE81-024404] p0143 N82-13983
TURBINE PUMPS
Design considerations for a 1500 M head 300-600 MW double stage reversible pump/turbine with regulation
p0154 A82-11782
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 1: Executive summary
[DE81-029440] p0155 N82-10527
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 2: Project design criteria: UPH
[DE81-028107] p0156 N82-10528
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 12: Plant design, CAES
[DE81-028110] p0157 N82-10574
Innovative equipment for small-scale hydro developments
[DE81-027820] p0141 N82-12634
TURBINES
Present status of Florida Power Corporation's D.O.E. funded feasibility study of the Higgins plant repowering/coal gasification project
p0089 A82-11834
Variable speed wind turbine control system
p0127 A82-11859
Lightning protection for wind turbine electronics
[AIAA PAPER 81-2571] p0129 A82-14028
A numerical model for the flow within the tower of a tornado-type wind energy system
p0131 A82-14844
Analytical solution of a simulation model for wind turbines
p0132 A82-16600
American Wind Energy Association, National Conference, Pittsburgh, PA, June 8-11, 1980, Proceedings
p0132 A82-17626
Energy potential and early operational experience for large wind turbines
p0132 A82-17627
Alcoa vertical axis wind turbines
p0133 A82-17628
Characteristics of vertical wind profiles --- at windpowered turbine sites
p0091 A82-17632
Operations of small wind turbines on a distribution system
p0133 A82-17633
Evaluation of wind turbine generator operational hysteresis using 'Method of Bins'
p0133 A82-17636
Yaw dynamics of a horizontal axis wind turbine
p0133 A82-17637

Experiences with a Grumman windstream 25 --- horizontal axis wind turbine p0134 A82-17638
Wind ripple analysis [DE81-030129] p0138 N82-11044

TURBOCOMPRESSORS
The effect of rotor blade thickness and surface finish on the performance of a small axial flow turbine [NASA-TM-82726] p0141 N82-13114

TURBOGENERATORS
Dynamic performance analysis for the solar hybrid repowering of the El Paso Electric Company Newman Unit No. 1 p0048 A82-11802
Turboexpanders for OTEC power plants [AIAA PAPER 81-2592] p0003 A82-14040
Turbines in the ocean p0132 A82-16844
The generation of current from hydrogen p0085 A82-17131
Application of large and small wind turbine generators - A utility perspective p0133 A82-17629
Large wind turbine generator performance assessment, technology status report no. 3 [DE81-903763] p0137 N82-10524
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 1: Executive summary [DE81-029440] p0155 N82-10527
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 2: Project design criteria: UPH [DE81-028107] p0156 N82-10528
Fabrication, testing, and modeling plans for a 125-kW counter-rotating-turbine wave energy converter [DE81-023946] p0137 N82-10559
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 12: Plant design, CAES [DE81-028110] p0157 N82-10574
Lewis Research Center's coal-fired, pressurized, fluidized-bed reactor test facility [NASA-TM-81616] p0103 N82-11397
Vertical-axis wind-turbine control strategy [DE81-031932] p0141 N82-12591
Aluminum blade development for the Mod-0A 200-kilowatt wind turbine [NASA-TM-82594] p0143 N82-14633

TURBOMACHINE BLADES
Calculation of natural modes of vibration for rotor blades by the finite element method [DFVLR-FB-81-07] p0136 N82-10452

TURBOMACHINERY
A modular simulation model for a wind turbine system [AIAA PAPER 81-2558] p0128 A82-14017
Aerodynamic loads and rotor performance for the Darrieus wind turbines [AIAA PAPER 81-2582] p0130 A82-14034
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 9: Design approaches: CAES, appendix C. Major mechanical equipment [DE81-030672] p0158 N82-11621

TURBULENT FLOW
Flow aerodynamics modeling of an MHD swirl combustor - Calculations and experimental verification p0127 A82-12113

TWO DIMENSIONAL FLOW
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer [FFA-134] p0140 N82-12537

TWO PHASE FLOW
Flow in geothermal wells. Part 4: Transition criteria for two-phase flow patterns [DE81-028312] p0096 N82-10366
Two-phase flow in geothermal energy sources [DE81-029037] p0103 N82-11404

U

UNDERGROUND EXPLOSIONS
Suppression of coal dust explosion by water barrier in a conveyor belt entry [PB81-233306] p0024 N82-13489

UNDERGROUND STORAGE
Planning an underground pumped hydro project for the Commonwealth Edison Company p0154 A82-11847
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 1: Executive summary [DE81-029440] p0155 N82-10527
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 2: Project design criteria: UPH [DE81-028107] p0156 N82-10528
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 5: Site selection [DE81-028199] p0156 N82-10529
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 9: Design approaches, CAES. Appendix D: Mechanical systems [DE81-028200] p0156 N82-10530
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 3: Project design criteria: CAES [DE81-028197] p0156 N82-10546
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 12: Plant design, CAES [DE81-028110] p0157 N82-10574
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 8: Design approaches: UPH [DE81-030673] p0158 N82-11620
Preliminary design study of underground pumped hydro and compressed-air energy storage in hard rock. Volume 9: Design approaches: CAES, appendix C. Major mechanical equipment [DE81-030672] p0158 N82-11621
Low-level radioactive waste: An introductory overview [DE81-026334] p0022 N82-12924
Mathematical modelling of some chemical and physical processes in underground coal gasification [DE81-027941] p0116 N82-14613
Comparison of potential radiological consequences from a spent-fuel repository versus natural-uranium deposits [DE81-028232] p0029 N82-14910
Reservoir stability studies [DE81-030099] p0160 N82-15510
Compressed-air energy-storage technology: Program overview [DE81-030103] p0160 N82-15548

UNDERGROUND STRUCTURES
Planning an underground pumped hydro project for the Commonwealth Edison Company p0154 A82-11847
Earth shelter 2. 1979-1980 USC series [CONF-800438] p0006 N82-10277
Solar project description for Colorado Sunworks: Single family [DE81-028054] p0064 N82-10510
Soviet UCG experience specifically related to field experiments in the United States [DE81-028642] p0111 N82-13244
Sixth Underground Coal-Conversion Symposium [DE81-027669] p0114 N82-14374

UNITED STATES OF AMERICA
Electric power supply and demand for the contiguous United States, 1981 - 1990 [DE81-027126] p0012 N82-11376

UNIVERSITIES
Seminars for private college administrators on solar applications for college buildings [DE81-027981] p0079 N82-14661

UPPER ATMOSPHERE
The stability of a tethered gyrosill [AIAA PAPER 81-2569] p0129 A82-14026

URANIUM
Environmental readiness document. Advanced Isotope Separation Program [DE81-029952] p0029 N82-14900
Comparison of potential radiological consequences from a spent-fuel repository versus natural-uranium deposits [DE81-028232] p0029 N82-14910

URANIUM COMPOUNDS
Hydrogen storage-bed design for tritium systems test assembly
[DE81-025336] p0086 N82-11262
URBAN PLANNING
The electric utility 4.5 MW fuel cell power plant - An urban demonstration
p0131 A82-15070
An energy saving transit concept for new towns
p0005 A82-15665
Modeling energy-conservation potentials of community energy-system technologies
[DE81-026059] p0013 N82-11589
URBAN RESEARCH
Evaporative hydrocarbon emissions from a large vehicle population
p0004 A82-14442
Urban ecosystem and resource-conserving urbanism in Third World cities
[DE81-029854] p0016 N82-11995
Evaluation of landfill gas as an energy source --- feasibility of methane recovery from landfills
[DE82-000116] p0110 N82-12584
URBAN TRANSPORTATION
An energy saving transit concept for new towns
p0005 A82-15665
USER MANUALS (COMPUTER PROGRAMS)
Programmer's manual for the DOEHPE (DOE Heat Pump Efficiency) program
[DE81-769452] p0007 N82-10551
User's guide to HELIOS: A computer program for modeling the optical behavior of reflecting solar concentrators. Part 1: Introduction and code input
[DE81-031920] p0073 N82-12616
USER REQUIREMENTS
Conceptual design for a multi-user medium BTU coal gasification complex. Volume 1: Executive summary
[DE81-027139] p0101 N82-11238
User needs for solar decision-making tools: The homebuilding industry
[DE81-027293] p0067 N82-11325
Offshore petroleum industry environmental data requirements: Emphasis on remote sensing
p0027 N82-14557
UTAH
Meteorological and climatological investigation: Review of January - June 1980 investigative period
[DE81-030740] p0111 N82-12731
UTILITIES
Status report on Central Maine Power Company's DOE Funded feasibility study of the Sears Island integrated gasification combined cycle power plant
p0089 A82-11835
Planning an underground pumped hydro project for the Commonwealth Edison Company
p0154 A82-11847
Control of new energy sources in an electric utility system
p0154 A82-13082
Analysis of electric utility investments into wind power
[AIAA PAPER 81-2537] p0003 A82-14006
Utility operating strategy and requirements for the wind power forecast
[AIAA PAPER 81-2539] p0127 A82-14007
Implementation of a siting methodology for utility size WECS in western Massachusetts and northwestern Connecticut
[AIAA PAPER 81-2540] p0091 A82-14008
Solar thermal cost goals - Implementing a methodology for assessing break-even value and market potential
[AIAA PAPER 81-2550] p0054 A82-14013
Incorporation and impact of a wind energy conversion system in generation expansion planning
p0004 A82-15068
Potential dynamic impacts of wind turbines on utility systems
p0131 A82-15071
Wind energy and the Nation's rural electric systems
p0091 A82-17645
Electric utility modeling extensions to evaluate solar plants
p0061 A82-18025
Integration of decentralized generators with the electric power grid
[DE81-029731] p0006 N82-10334
Intermediate photovoltaic-system application experiment operational performance report. Volume 1: For Lovington Square Shopping Center site, Lovington, New Mexico
[DE81-028971] p0065 N82-10543
Project demonstration of wind-turbine electricity: Interconnecting a northern Michigan fruit farm with a major utility
[DE81-030950] p0138 N82-11380
Passive solar technical planning study
[EPRI-ER-1591] p0072 N82-12578
Analysis of potential cogeneration impacts on electricity generation by the Central Maine Power Company
[DE81-029991] p0028 N82-14650

V

VACUUM DEPOSITION
Solution grown PbS/CdS multilayer stacks as selective absorbers
p0041 A82-10472
Preparation and properties of graded band gap CdS/x/Te/1-x/ thin film solar cells
p0051 A82-12818
VALUE ENGINEERING
Value tree analysis of energy supply alternatives
[AD-A105629] p0029 N82-14875
VANADIUM OXIDES
V2O5-Si photovoltaic cells
p0051 A82-12824
Rechargeable lithium/vanadium oxide cells utilizing 2Me-THF/Li-sF6
p0154 A82-15726
VAPOR DEPOSITION
Characteristics of CVD silicon carbide thermionic converters
p0124 A82-11821
A new low temperature III-V multilayer growth technique - Vacuum metalorganic chemical vapor deposition --- of GaAs thin films
p0053 A82-13803
Investigations on a Se-CdO photovoltaic cell
p0132 A82-16052
Solar selective properties and high temperature stability of CVD ZrB2
p0057 A82-16055
VAPOR PHASES
Controlled-flash pyrolysis
[DE82-000284] p0111 N82-13196
Transient catalytic combustor model
[NASA-CR-165324] p0142 N82-13507
VAPORIZING
Vaporization and chemical transport under coal gasification conditions
[PB81-245839] p0117 N82-15165
VAPORS
Three-dimensional, finite elemental model for simulating heavier-than-air gaseous releases over variable terrain
[DE81-026689] p0032 N82-15602
VARIABILITY
Effects of atmospheric variability on energy utilization and conservation
[DE81-026308] p0008 N82-10592
VARIABLE PITCH PROPELLERS
Yawing of wind turbines with blade cyclic pitch variation
[DE81-030091] p0138 N82-11045
VEGETATION
Development of peatlands in northern Minnesota
[DE82-000873] p0112 N82-13475
VELOCITY DISTRIBUTION
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] p0140 N82-12537
VELOCITY MEASUREMENT
Controlled velocity testing of small wind energy conversion systems - An evaluation of a technique
p0134 A82-17642
VENEZUELA
Venezuela, Trinidad and Tobago: Crude oil potential from known deposits
[DE81-027023] p0096 N82-10474
VENTILATION
Indoor air quality
[DE81-029857] p0033 N82-15611

VERTICAL DISTRIBUTION
Characteristics of vertical wind profiles --- at windpowered turbine sites p0091 A82-17632
German-Argentine experiment: Vertical-rotor wind engine p0141 N82-12648
VERTICAL ORIENTATION
Residual stresses in darrieus vertical axis wind turbine blades [DE81-1026144] p0136 N82-10434
VIBRATION
Dynamic stability of stacked disk type flywheels [DE81-030008] p0156 N82-10535
VIBRATION MODE
Calculation of natural modes of vibration for rotor blades by the finite element method [DFVLR-FB-81-07] p0136 N82-10452
VIBRATION TESTS
Enertech High Reliability prototype vibration analysis p0133 A82-17635
VOLT-AMPERE CHARACTERISTICS
Numerical simulation of solar cell open circuit voltage decay p0041 A82-10658
The contoured-oxide monolithic series-array solar battery p0042 A82-11190
Cascade photogenerators based on silicon and germanium matrix photoconverters p0044 A82-11422
Solar panel current degradation factors p0045 A82-11759
The development of high efficiency cascade solar cells - An overview p0047 A82-11794
Effect of annealing CdS on a sintered CdS/Cu2S solar cell p0051 A82-12820
ZnO - p-InP heterojunction solar cells p0051 A82-12821
Photoelectrochemical behaviour of CdS/NaI.3.3NH3 /liquid sodium iodide ammoniate/ junctions - Utilization in solar energy conversion p0051 A82-12822
A practical method of analysis of the current-voltage characteristics of solar cells p0051 A82-12823
V2O5-Si photovoltaic cells p0051 A82-12824
Temperature dependence of the short-circuit current in MIS solar cells p0052 A82-12825
Oxide optimization at the p-Si/aqueous electrolyte interface p0052 A82-13199
Thin-film gallium arsenide homojunction solar cells p0052 A82-13200
Production and certain properties of photoelectric cells based on silicon epitaxial structures p0053 A82-13716
Silicon and gallium arsenide photovoltaic cells - Models for the functioning, experimentation, and application to concentrating collectors --- French thesis p0055 A82-15006
Current-voltage characteristics of semiconductor-electrolyte junction solar cells p0055 A82-15112
An analytical model for high-low-emitter /HLE/ solar cells in concentrated sunlight p0055 A82-15441
Effect of junction depth on the performance of a diffused n/+/p silicon solar cell p0056 A82-15444
Grain size dependence of the photovoltaic properties of solar grade polysilicon p0057 A82-16051
High efficiency inversion layer solar cells on polycrystalline silicon by the application of silicon nitride p0058 A82-16127
A method for experimental assessment of the shifting approximation, with application to polysilicon solar cells --- effect of constant series resistance p0058 A82-16131
n-/indium tin oxide//p-InP solar cells p0058 A82-16471
Effects of double-exponential current-voltage characteristics on the performance of solar cells p0058 A82-16472
A comparison of p-i-n and Schottky barrier hydrogenated amorphous silicon, a-Si:H, solar cells p0060 A82-17649
The El Paso electric 20-kilowatt photovoltaic system [AIAA PAPER 82-0074] p0060 A82-17761
End region and current consolidation effects upon the performance of an MHD channel for the ETF conceptual design --- Engineering Test Facility [AIAA PAPER 82-0325] p0135 A82-17889
Electrical properties of infrared photovoltaic Cd/x/Hg/1-x/Te detectors p0136 A82-18466
VOLTAGE AMPLIFIERS
Improved technique to measure electronically AC losses in superconducting cables [DE81-029323] p0150 N82-15338
VOLTAGE REGULATORS
Series vs. shunt regulators for power control in satellite power systems p0045 A82-11738
Distributed photovoltaic systems: Utility interface issues and their present status [NASA-CR-165019] p0076 N82-13492
VORTEX GENERATORS
A numerical model for the flow within the tower of a tornado-type wind energy system p0131 A82-14844
VOYAGER 2 SPACECRAFT
Highlights of 1981 activities [NASA-NEWS-RELEASE-81-199] p0161 N82-15008

W

WAFERS
Thin cells - Their present status and future areas of development p0046 A82-11764
WALL PRESSURE
Novel design of pressure vessels and thermal shields in coal gasifiers [DE81-025828] p0104 N82-11474
WASHING
Coal resources and sulphur emission regulations: A summary of 8 eastern and midwestern states [PB81-240319] p0031 N82-15514
WASTE DISPOSAL
Environmental compliance program handbook [DE81-030226] p0008 N82-10585
Coal fly ash: A review of the literature and proposed classification system with emphasis on environmental impacts [PB81-215014] p0009 N82-10608
Solid and hazardous energy wastes: Synfuels. 1: Review of research activities [DE81-028503] p0014 N82-11644
Sulfur pollution control. Phase 1: The disposal program [PB81-222612] p0014 N82-11652
Low-level radioactive waste: An introductory overview [DE81-026334] p0022 N82-12934
Technology assessment of solar energy systems: Availability and impacts of woody biomass utilization in the Pacific Northwest [DE82-000705] p0024 N82-13535
Chemical element concentrations in liquids and solids associated with power plants using FGD systems [DE81-030422] p0027 N82-14322
Coal conversion solid waste disposal [DE81-028567] p0116 N82-14680
WASTE ENERGY UTILIZATION
The economic implications of the exergy and thermal efficiencies of energy conversion systems p0121 A82-11702
High temperature cogeneration with thermionic burners p0124 A82-11817
Turboexpanders for OTEC power plants [AIAA PAPER 81-2592] p0003 A82-14040
Fuels from biomass and wastes --- Book p0091 A82-14986

Vertical combustor for refuse combustion
[DE81-030002] p0098 N82-11152
Feasibility and economic study of medium-BTU coal gas blended with high-BTU by product gas as an industrial energy source at Billings, Montana
[DE81-025166] p0101 N82-11237
Production and utilization of methane from anaerobic sludge digestion in U.S. wastewater-treatment plants
[DE81-029958] p0101 N82-11246
Cycle and performance analysis of absorption heat pumps for waste heat utilization
[DE81-030705] p0103 N82-11405
Fluid-bed heat-exchanger optimization and bed materials selection
[DOE/ET-11343/T2] p0104 N82-11571
Residual-energy-applications program: EAST-facility requirements document
[DE81-027489] p0014 N82-11616
Air circuit with heating pump
[BMFT-FB-T-80-188] p0017 N82-12404
High-temperature counter-flow recuperator
[DE81-031923] p0017 N82-12424
Utilization of waste heat from major transformer substations. Volume 1: Generic study
[DE81-904212] p0019 N82-12593
Utilization of waste heat from major transformer substations. Volume 2: Site-specific study
[DE81-904236] p0019 N82-12594
Design, construction, and operation of a full scale experimental anaerobic fermentation facility
[DE81-029028] p0110 N82-12605
Conversion of municipal solid waste to energy, Jacksonville, Florida, phase 1
[DE82-000808] p0019 N82-12613
Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] p0019 N82-12621
Power-plant fly-ash utilization: A chemical-processing perspective
[DE81-025452] p0022 N82-13191
Design and development of a reciprocating low-temperature freon expander
[DE81-028609] p0023 N82-13392
Residual-energy-applications program environmental analysis report --- industrial scale waste heat recovery equipment and utilization
[DE81-027538] p0024 N82-13525
Residual-energy-application program: EAST facility requirements document, volume 1
[DE81-027536] p0142 N82-13526
Biomass energy systems: Descriptions and employment requirements for typical operations
[DE82-000236] p0113 N82-13538
New and renewable energy in the United States of America
[DE81-030887] p0024 N82-13539
Waste heat and chill storage in aquifer systems
[DE81-028016] p0159 N82-14652
Rotating regenerative heat exchanger for energy recovery in chemical plants
[BMFT-FB-T-81-099] p0030 N82-15367

WASTE TREATMENT
Energy from biomass and wastes V; Proceedings of the Fifth Symposium, Lake Buena Vista, FL, January 26-30, 1981
p0090 A82-12400
EPA utility FGD (Flue Gas Desulfurization) survey
[PB81-225773] p0015 N82-11679
Thermal processing of used catalysts
[BMFT-FB-T-80-189] p0016 N82-12205
Evaluation of landfill gas as an energy source --- feasibility of methane recovery from landfills
[DE82-000116] p0110 N82-12584
Waste-to-energy Systems Institutional Barriers Assessment Workshop
[DE82-000098] p0019 N82-12621
Development of testing procedures and bibliographic information relevant to the testing of solid wastes resulting from synthetic-fuels production
[DE81-030671] p0021 N82-12673
Treatment of biomass gasification wastewaters using reverse osmosis
[DE82-000698] p0025 N82-13566
Treatment of biomass-gasification wastewaters by wet-air oxidation
[DE82-000935] p0025 N82-13567

WASTE UTILIZATION
Energy from biomass and wastes V; Proceedings of the Fifth Symposium, Lake Buena Vista, FL, January 26-30, 1981
p0090 A82-12400
Methane production from alkaline food waste
p0092 N82-10115
Crystallized fly-ash feasibility study
[EPRI-EL-1836] p0009 N82-10599
The severity of institutional barriers affecting energy-from-municipal-waste technologies
[DE82-000133] p0018 N82-12583
Energy recovery from municipal solid waste and sewage sludge using multi-solid fluidized bed combustion technology
[DE82-001142] p0110 N82-12596
Interactive model to assess economics of anaerobic digestion of the farm
[DE82-000452] p0110 N82-12620
Treatment of biomass gasification wastewaters using reverse osmosis
[DE82-000698] p0025 N82-13566
Treatment of biomass-gasification wastewaters by wet-air oxidation
[DE82-000935] p0025 N82-13567
Energy balance and utilization of agricultural waste on a farm
[PB81-229262] p0115 N82-14385
Energy recovery from municipal waste development program for Idaho Falls, Idaho
[DE81-029999] p0028 N82-14659
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] p0035 N82-15652

WASTE WATER
Production and utilization of methane from anaerobic sludge digestion in U.S. wastewater-treatment plants
[DE81-029958] p0101 N82-11246
Kinetics of wet oxidation of biological sludges from coal-conversion wastewater treatment
[DE82-000525] p0021 N82-12674

WASTES
Survey of particulate emission macro- and micro-sampling and sizing methods
[DE81-028348] p0014 N82-11642

WATER
The development and design of steam/water solar receivers for commercial application
[ASME PAPER 81-SOL-4] p0042 A82-10972
Parametric study of the cadmium thermoelectrochemical hydrogen cycle
p0083 A82-11785
Alkaline solution water electrolysis - '81
p0083 A82-11786
Development status of the General Electric solid polymer electrolyte water electrolysis technology --- hydrogen production
p0083 A82-11787
The GA sulfur-iodine water-splitting process - A status report
p0084 A82-11844
Thermochemical processes for hydrogen production by water splitting - From theory to practice
p0086 A82-18392

WATER CONSUMPTION
Water and energy usage in coal preparation
[PB81-238248] p0112 N82-13486

WATER FLOW
One-dimensional model of vapor-dominated geothermal systems
p0089 A82-11033
Planning an underground pumped hydro project for the Commonwealth Edison Company
p0154 A82-11847
Fracture flow of groundwater in coal-bearing strata
[DE81-023810] p0096 N82-10479

WATER HEATING
Conceptual design of an advanced water/steam receiver for a solar thermal central power system
[ASME PAPER 81-SOL-5] p0042 A82-10973
Thermal performance of a solar still
p0058 A82-16229
Wind driven fluid devices for water heating
p0134 A82-17639
Solar project description for living systems single family residence, Davis, California
[DE81-029743] p0064 N82-10511

Application of solar thermal energy to buildings and industry
[SERI/TP-641-1222] p0066 N82-10563
Preliminary investigation on a primary energy saving heat supply system for the residential district "Maria Lindenhof" in Dorsten, West Germany --- using river water as a heat source and systems engineering
[BMFT-FB-T-80-157] p0008 N82-10572
The Rogers focusing heliostat experimental program at Rensselaer Polytechnic Institute
[PB81-226813] p0071 N82-11625
Solar Heating And Cooling Of Buildings (SHACOB): Requirements definition and impact analysis-2. Volume 2: Domestic hot water systems
[DE82-900207] p0071 N82-12279
Fuel savings in hot water heating plants by application of heat pumps operated with natural gas (natural gas heat pump). Project: gas engine
[BMFT-FB-T-80-125] p0020 N82-12641
Appliance efficiency and the solar building
[DE81-029073] p0075 N82-13265
Moorhead district heating, phase 2
[DE81-029689] p0031 N82-15556

WATER POLLUTION
Assessment of water supply contamination due to underground coal gasification
[PB81-209215] p0021 N82-12680
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] p0034 N82-15624

WATER QUALITY
Assessment of water supply contamination due to underground coal gasification
[PB81-209215] p0021 N82-12680
Effects of coal fly-ash disposal on water quality in and around the Indiana Dunes National Lakeshore, Indiana
[PB81-238479] p0034 N82-15624

WATER RESOURCES
Feasibility of a small scale pumped storage demonstration project, Hibbing, Minnesota
[DE81-028678] p0155 N82-10525
Coal liquefaction demonstration plant near Morgantown, West Virginia; water assessment report section 13(b)
[PB81-216095] p0103 N82-11269
Coal liquefaction demonstration plant near Morgantown, West Virginia: Water assessment report
[PB81-216103] p0011 N82-11270
Synthetic fuel development for the Upper Missouri River Basin. Section 13: Water assessment report
[PB81-224537] p0011 N82-11276
Great Plains gasification project, Mercer County, North Dakota; water assessment report section 13(c)
[PB81-216111] p0013 N82-11524
Great Plains gasification project, Mercer County, North Dakota; water assessment report
[PB81-216129] p0013 N82-11525

WATER VAPOR
Experimental demonstration of the feasibility of the Mist Flow Ocean Thermal Energy Process
[AIAA PAPER 81-2596] p0136 A82-18220

WATER WAVES
Ocean energy-waves, currents, and tides
[DE81-025708] p0105 N82-11611

WATER WHEELS
Modular hydro dam approach to the economic development of ultra low-head hydropower
[DE81-027817] p0019 N82-12635

WATERPROOFING
Suppression of coal dust explosion by water barrier in a conveyor belt entry
[PB81-233306] p0024 N82-13489

WATERWAVE ENERGY CONVERSION
Waves of energy
p0121 A82-10450
North American tidal power prospects
p0131 A82-15667
International Symposium on Wave and Tidal Energy, 2nd, St. John's College, Cambridge, England, September 23-25, 1981, Proceedings
p0135 A82-18124
Fabrication, testing, and modeling plans for a 125-kW counter-rotating-turbine wave energy converter
[DE81-023946] p0137 N82-10559
Ocean energy-waves, currents, and tides
[DE81-025708] p0105 N82-11611
Overview and FY 1981 progress on open-cycle OTEC power systems
[DE81-029277] p0144 N82-15580

WAVE PROPAGATION
Proposed experimental studies for assessing ionospheric perturbations on SPS uplink pilot beam signal
p0147 N82-12543
Ionospheric effects in active retrodirective array and mitigating system design
p0147 N82-12551

WAVEGUIDE ANTENNAS
SPS antenna element evaluation
p0148 N82-12555
Evaluation of thick wall wave guide element
p0148 N82-12557
Method for precision forming of low-cost, thin-walled slotted waveguide arrays for the SPS
p0148 N82-12558

WEATHER
Effects of atmospheric variability on energy utilization and conservation
[DE81-026308] p0008 N82-10592

WEATHER FORECASTING
The Seasat commercial demonstration program
p0115 N82-14561

WEIGHT REDUCTION
High performance silicon solar arrays employing advanced structures
p0045 A82-11758
Thin cells - Their present status and future areas of development
p0046 A82-11764
Lightweight hydrides for automotive storage of hydrogen
p0084 A82-11790

WELDING
Space nuclear safety and fuels program
p0111 N82-12921

WELLS
Flow in geothermal wells. Part 4: Transition criteria for two-phase flow patterns
[DE81-028312] p0096 N82-10366
Two-phase flow in geothermal energy sources
[DE81-029037] p0103 N82-11404
Well-water-source heat pump field performance study
[DE81-024136] p0012 N82-11419
Designing process wells for an underground coal-gasification environment
[DE81-028434] p0108 N82-12264
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] p0109 N82-12516
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026962] p0115 N82-14523

WEST VIRGINIA
Coal liquefaction demonstration plant near Morgantown, West Virginia; water assessment report section 13(b)
[PB81-216095] p0103 N82-11269
Coal liquefaction demonstration plant near Morgantown, West Virginia: Water assessment report
[PB81-216103] p0011 N82-11270
Pyrolytic characterization of the organic matter in selected coals and in the Devonian shales of southern West Virginia
p0113 N82-13578

WHISKER COMPOSITES
Electrodes and diaphragms for fuel cells
[BMFT-FB-T-81-047] p0143 N82-14666

WICKS
Effect of wick dryness on the performance of heat pipes with separate channels
p0005 A82-16272

WIND (METEOROLOGY)
Wind ripple analysis
[AIAA PAPER 81-2580] p0129 A82-14033

WIND DIRECTION
Up- and down-wind rotor half interference model for VAWT --- Vertical Axis Wind Turbines
[AIAA PAPER 81-2579] p0129 A82-14031
Wind energy for the Federal Republic of Germany p0130 A82-14358

WIND EFFECTS
Wind ripple analysis
[DE81-030129] p0138 N82-11044

WIND PROFILES
Characteristics of vertical wind profiles --- at windpowered turbine sites p0091 A82-17632
Network wind power over the Pacific northwest. Appendix 1: Wind statistics summaries for the wind power data stations
[DE81-029291] p0112 N82-13518

WIND SHEAR
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] p0140 N82-12537

WIND TUNNEL TESTS
The effect of shielding on the aerodynamic performance of Savonius wind turbines p0125 A82-11826
First results from the UMass wind tunnel test program --- for windpowered generator optimization p0134 A82-17643

WIND VARIATIONS
Wind ripple analysis
[DE81-030129] p0138 N82-11044

WIND VELOCITY
Utility operating strategy and requirements for the wind power forecast
[AIAA PAPER 81-2539] p0127 A82-14007
Wind energy for the Federal Republic of Germany p0130 A82-14358
Analytical solution of a simulation model for wind turbines p0132 A82-16600
Alcoa vertical axis wind turbines p0133 A82-17628
Wind energy conversion system design and analysis program p0133 A82-17630
Characteristics of vertical wind profiles --- at windpowered turbine sites p0091 A82-17632
Overview of the Wind Energy Application Network for Hawaii p0133 A82-17634
Yaw dynamics of a horizontal axis wind turbine p0133 A82-17637
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] p0140 N82-12537
Network wind power over the Pacific northwest. Appendix 1: Wind statistics summaries for the wind power data stations
[DE81-029291] p0112 N82-13518
Numerical wind-speed simulation model
[DE82-000956] p0113 N82-13627
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] p0119 N82-15560

WIND VELOCITY MEASUREMENT
Performance testing of a Savonius windmill rotor in shear flows p0125 A82-11827
Evaluation of wind turbine generator operational hysteresis using 'Method of Bins' p0133 A82-17636

WINDMILLS (WINDPOWERED MACHINES)
Application of orthotropic plate theory to windmill blade design p0121 A82-10978
The effect of shielding on the aerodynamic performance of Savonius wind turbines p0125 A82-11826
Performance testing of a Savonius windmill rotor in shear flows p0125 A82-11827
Siting and land-use considerations in wind energy development
[AIAA PAPER 81-2541] p0003 A82-14009
A modular simulation model for a wind turbine system
[AIAA PAPER 81-2558] p0128 A82-14017
A first order mathematical model of the lift/drag characteristics of aerofoil sections p0130 A82-14357
An analytic model of high solidity vertical axis windmills p0131 A82-14360
Potential dynamic impacts of wind turbines on utility systems p0131 A82-15071
Wind-energy recovery by a static Scherbius induction generator p0131 A82-15650
Wind driven fluid devices for water heating p0134 A82-17639
Water-pumping-windmill designs: A handbook
[DE81-904016] p0137 N82-10536

WINDOWS (APERTURES)
Optical degradation of antireflective silica film on solar collector windows p0041 A82-10836
Comparison of residential window distributions and effects of mass and insulation
[DE81-027938] p0017 N82-12283

WINDPOWER UTILIZATION
Alternative power sources for residential air-conditioning systems p0039 A82-10331
Net energy analysis of small wind energy conversion systems p0121 A82-11389
Utilization of wind/solar energy in generating electricity in Saudi Arabia p0049 A82-11830
Review of electrochemical energy conversion and storage for ocean thermal and wind energy systems p0126 A82-11832
Analysis of electric utility investments into wind power
[AIAA PAPER 81-2537] p0003 A82-14006
Implementation of a siting methodology for utility size WECS in western Massachusetts and northwestern Connecticut
[AIAA PAPER 81-2540] p0091 A82-14008
Cost estimates for advanced/innovative wind energy conversion systems /AWECS/
[AIAA PAPER 81-2557] p0128 A82-14016
Rotor speed control by automatic yawing of two-bladed wind turbines with passive cyclic pitch variation
[AIAA PAPER 81-2570] p0129 A82-14027
Lightning protection for wind turbine electronics
[AIAA PAPER 81-2571] p0129 A82-14028
Wind ripple analysis
[AIAA PAPER 81-2580] p0129 A82-14033
One viewpoint concerning unit size in the development of wind turbines p0131 A82-14845
American Wind Energy Association, National Conference, Pittsburgh, PA, June 8-11, 1980, Proceedings p0132 A82-17626
Energy potential and early operational experience for large wind turbines p0132 A82-17627
Application of large and small wind turbine generators - A utility perspective p0133 A82-17629
Overview of the Wind Energy Application Network for Hawaii p0133 A82-17634
Wind energy and the Nation's rural electric systems p0091 A82-17645
Security assessment of power systems including energy storage and with the integration of wind energy
[DE81-030166] p0140 N82-12590
Spectra over complex terrain
[DE81-028734] p0112 N82-13473
Network wind power over the Pacific northwest. Appendix 1: Wind statistics summaries for the wind power data stations
[DE81-029291] p0112 N82-13518
Wind Power: Research on network wind power over the Pacific northwest. Executive summary
[DE81-029360] p0142 N82-13519
Application of Bayesian analysis for wind energy site evaluation p0113 N82-13619

Numerical wind-speed simulation model
[DE82-000956] p0113 N82-13627
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] p0119 N82-15560

WINDPOWERED GENERATORS
Small sodium sulfur battery for solar and wind energy systems
p0047 A82-11778
Establishment of noise acceptance criteria for wind turbines
p0125 A82-11825
An overview of fatigue failures at the Rocky Flats Wind System Test Center
p0125 A82-11828
A vertical axis cyclogiro type wind-turbine with freely-hinged blades
p0125 A82-11829
Utilization of wind/solar energy in generating electricity in Saudi Arabia
p0049 A82-11830
Design considerations for small wind energy conversion and storage systems
p0126 A82-11831
Variable speed wind turbine control system
p0127 A82-11859
Utility operating strategy and requirements for the wind power forecast
[AIAA PAPER 81-2539] p0127 A82-14007
Wind turbine assisted diesel generator systems
[AIAA PAPER 81-2559] p0128 A82-14018
Methodology for the evaluation of aerodynamic performance and rotor optimization under constant RPM operation
[AIAA PAPER 81-2560] p0128 A82-14019
The transformation of wind energy by a high altitude power plant /HAPP/
[AIAA PAPER 81-2568] p0128 A82-14025
The stability of a tethered gyromill
[AIAA PAPER 81-2569] p0129 A82-14026
An aeroelastic analysis of the Darrieus wind turbine
[AIAA PAPER 81-2572] p0129 A82-14029
Up- and down-wind rotor half interference model for VAWT --- Vertical Axis Wind Turbines
[AIAA PAPER 81-2579] p0129 A82-14031
Wind ripple analysis
[AIAA PAPER 81-2580] p0129 A82-14033
Aerodynamic loads and rotor performance for the Darrieus wind turbines
[AIAA PAPER 81-2582] p0130 A82-14034
A review of rain erosion problems for aerogenerators
p0130 A82-14356
Wind energy for the Federal Republic of Germany
p0130 A82-14358
Energy transfer in wind-assist electric power systems
p0130 A82-14359
A numerical model for the flow within the tower of a tornado-type wind energy system
p0131 A82-14844
One viewpoint concerning unit size in the development of wind turbines
p0131 A82-14845
Incorporation and impact of a wind energy conversion system in generation expansion planning
p0004 A82-15068
Potential dynamic impacts of wind turbines on utility systems
p0131 A82-15071
Wind-energy recovery by a static Scherbius induction generator
p0131 A82-15650
Analytical solution of a simulation model for wind turbines
p0132 A82-16600
Computational analysis of diffuser-augmented wind turbines
p0132 A82-16743
American Wind Energy Association, National Conference, Pittsburgh, PA, June 8-11, 1980, Proceedings
p0132 A82-17626
Energy potential and early operational experience for large wind turbines
p0132 A82-17627
Alcoa vertical axis wind turbines
p0133 A82-17628
Application of large and small wind turbine generators - A utility perspective
p0133 A82-17629
Wind energy conversion system design and analysis program
p0133 A82-17630
Lightning protection for composite rotor blades --- of windpowered turbines
p0133 A82-17631
Characteristics of vertical wind profiles --- at windpowered turbine sites
p0091 A82-17632
Operations of small wind turbines on a distribution system
p0133 A82-17633
Enertech High Reliability prototype vibration analysis
p0133 A82-17635
Evaluation of wind turbine generator operational hysteresis using 'Method of Bins'
p0133 A82-17636
Yaw dynamics of a horizontal axis wind turbine
p0133 A82-17637
Experiences with a Grumman windstream 25 --- horizontal axis wind turbine
p0134 A82-17638
Development of high-performance, high-reliability windpower generators
p0134 A82-17640
Analytical evaluation of the aerodynamic performance of a high-reliability vertical-axis wind turbine
p0134 A82-17641
Controlled velocity testing of small wind energy conversion systems - An evaluation of a technique
p0134 A82-17642
First results from the UMass wind tunnel test program --- for windpowered generator optimization
p0134 A82-17643
SWECS technology - State-of-the-art and achievable goals --- Small Wind Energy Conversion Systems
p0134 A82-17644
Performance testing and rating standards for Wind Energy Conversion Systems
p0135 A82-17646
Performance of a small low speed Darrieus type rotor
p0136 A82-18328
An indoor blade test facility for determining the basic aerodynamic properties of Darrieus wind turbine airfoils with test results for an NACA 0015 and a modified section
p0136 N82-10005
Residual stresses in darrieus vertical axis wind turbine blades
[DE81-1026144] p0136 N82-10434
Large wind turbine generator performance assessment, technology status report no. 3
[DE81-903763] p0137 N82-10524
Analysis of data from the US Department of Energy's meteorological validation program
[DE81-030100] p0097 N82-10655
Wind ripple analysis
[DE81-030129] p0138 N82-11044
Yawing of wind turbines with blade cyclic pitch variation
[DE81-030091] p0138 N82-11045
Project demonstration of wind-turbine electricity: Interconnecting a northern Michigan fruit farm with a major utility
[DE81-030950] p0138 N82-11380
Site selection for small wind energy conversion systems for US Department of Energy field evaluation program
[PB81-226862] p0014 N82-11624
A two-dimensional study of the maximum power that can be obtained from a wind turbine in a wind shear layer
[FFA-134] p0140 N82-12537
Vertical-axis wind-turbine control strategy
[DE81-031932] p0141 N82-12591
German-Argentine experiment: Vertical-rotor wind engine
p0141 N82-12648
Aluminum blade development for the Mod-0A 200-kilowatt wind turbine
[NASA-TM-82594] p0143 N82-14633
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] p0119 N82-15560

WINDPOWERED PUMPS
Water-pumping-windmill designs: A handbook
[DE81-904016] p0137 N82-10536
WING FLOW METHOD TESTS
Wing design for light transport aircraft with improved fuel economy
p0004 A82-14416
WING TANKS
Experimental study of fuel heating at low temperatures in a wing tank model, volume 1
[NASA-CR-165391] p0100 N82-11224
WISCONSIN
SOLPLAN report: An assessment of barriers and incentives to conservation and alternative-energy use in the residential sector in Wisconsin
[DOE/CS-30292/3] p0013 N82-11614
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604
WOOD
Kinetics and catalysis of producing synthetic gases from biomass
[PB81-217614] p0095 N82-10272
NASEC industrial fuel-wood program
[DE82-000461] p0110 N82-12595
Wood resources and utilization patterns in the North Central Region and energy needs for the manufacture of wood products
[DE81-030356] p0019 N82-12604
Thermochemical production of liquids from biomass
[DE81-030085] p0117 N82-15226
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] p0033 N82-15613
WORKING FLUIDS
Analysis of power, mass, and size parameters of solar vapor-turbine two-circuit systems with organic working bodies
p0044 A82-11421
Brayton cycle using dissociating nitrosyl chloride
p0126 A82-11852
The effect of variable fluid properties on scale modeling --- of solar central receivers
p0049 A82-12269
Organic fluids for the practical use in energy conversion systems of solar power plants
[BMFT-FB-T-81-154] p0080 N82-15537
WYOMING
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0118 N82-15489

Y

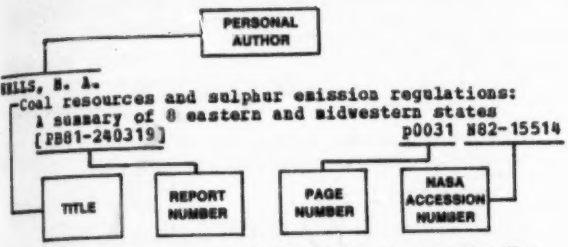
YAWING MOMENTS
Rotor speed control by automatic yawing of two-bladed wind turbines with passive cyclic pitch variation
[AIAA PAPER 81-2570] p0129 A82-14027
Yaw dynamics of a horizontal axis wind turbine
p0133 A82-17637
Yawing of wind turbines with blade cyclic pitch variation
[DE81-030091] p0138 N82-11045
YELLOWSTONE NATIONAL PARK (ID-MT-WY)
Geologic applications of thermal-inertia mapping from satellite --- Powder River, Wyoming; Cubeza Prieta, Arizona, and Yellowstone National Park
[E82-10011] p0118 N82-15489
YIELD
H-coal process improvement study. Bench unit baseline run with preheater/reactor
[DE81-026022] p0094 N82-10260

Z

ZINC OXIDES
ZnO - p-InP heterojunction solar cells
p0051 A82-12821
Zn3P2 as an improved semiconductor for photovoltaic solar cells
[DE81-025587] p0069 N82-11577
ZINC-CHLORINE BATTERIES
Life-testing of 1.7 kW h zinc-chloride battery system - Cycles 1 - 1000
p0155 A82-18498
ZIRCONIUM COMPOUNDS
Solar selective properties and high temperature stability of CVD ZrB2
p0057 A82-16055

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

A

ABBOTT, R.
Relaxation of geothermal-reservoir stresses induced by heat production
[DE81-032024] p0105 N82-11715

ABBATIELLO, L. A.
Seasonal performance factors for active solar systems and heat-pump systems
[DE81-028569] p0074 N82-12625

ABDELKRIM, M.
A practical method of analysis of the current-voltage characteristics of solar cells
p0051 A82-12823

ABDERRASSOUL, R. A.
Thin-film polycrystalline cadmium telluride solar cells and large-area polycrystalline silicon solar cells
p0062 N82-10490

ABDURAKHMANOV, A.
Efficiency of selective surfaces for solar thermal collectors
p0044 A82-11425

ABDURAKHMANOV, B. M.
Production and certain properties of photoelectric cells based on silicon epitaxial structures
p0053 A82-13716

ABHAT, A.
Development of a modular heat exchanger with integrated latent heat energy store
[BMFT-FB-T-81-050] p0160 N82-15584

ABOU-ZEID, M. H.
A simplified method for direct calculation of the annual load fraction of solar systems for space heating
p0054 A82-14405

ABRAHAM, K. M.
Rechargeable lithium/vanadium oxide cells utilizing 2Me-THF/LiAsF6
p0154 A82-15726

ACHILOV, B. M.
Method for calculating the unsteady temperature conditions of the generator in a solar refrigeration system
p0056 A82-15642

ADAMS, L.
High performance silicon solar arrays employing advanced structures
p0045 A82-11758

ADAMS, M. A.
Fracture mechanics of cellular glass
[NASA-CR-164959] p0066 N82-11209

ADAMS, R. C.
Demonstration of Wellman-Lord/Allied Chemical FGD technology: Demontration test second year results
[PB81-246316] p0034 N82-15626

AGARWAL, A. K.
Pricetown 1 underground coal gasification field test: Operations report
[DE81-025162] p0095 N82-10268

AGNIHOTRI, O. P.
Spectrally selective copper sulphide coatings
p0040 A82-10468

AHEAD, J.
Evaluation of organic acids as fuel cell electrolytes
p0127 A82-12938

AHMADI, G.
Performance of a small low speed Darrieus type rotor
p0136 A82-18328

AIMAN, W. R.
Solar coal-gasification reactor for hydrocarbon-free synthesis gas
[DE81-026600] p0067 N82-11247
Design and test of two-step solar oil shale retort
[DE82-000964] p0077 N82-13543

AKHMEDOV, F. A.
Investigation of the possibility of using inexpensive concentrating systems in the modules of a photoelectric station
p0052 A82-13713

AKINS, R. E.
Wind ripple analysis
[AIAA PAPER 81-2580] p0129 A82-14033
Wind ripple analysis
[DE81-030129] p0138 N82-11044

ALDEN, D. R.
Field demonstration of the conventional steam drive process with ancillary materials
[DE81-026849] p0115 N82-14522

ALDIS, D. F.
Solar-supplemented, natural air drying of shelled corn: The economic limitations
[PB81-235681] p0079 N82-14668

ALDRICH, J.
Hot dry rock geothermal prospects, 1981
[DE81-025305] p0119 N82-15559

ALI, M. F.
Optical diagnostic techniques for coal-fired MHD applications
[AIAA PAPER 82-0377] p0135 A82-17913

ALIEV, R.
Production and certain properties of photoelectric cells based on silicon epitaxial structures
p0053 A82-13716

ALLWINE, K. J.
Technology assessment of solar energy systems: Availability and impacts of woody biomass utilization in the Pacific Northwest
[DE82-000705] p0024 N82-13535

ALLWINE, K. J., JR.
Assessment of the long-range transport of residential woodstove fine-particulate emissions for two future United States energy scenarios
[DE81-030096] p0033 N82-15613

ALVARES, N. J.
Fire-protection research for energy technology: Fy 80 year end report
[DE82-000970] p0161 N82-14649

AMBERG, H. U.
Practical demonstration of heat pumps for utilization of animal-generated heat
[BMFT-FB-T-80-100] p0017 N82-12403

AMBROS, J. H.
Advances in space power research and technology at the National Aeronautics and Space Administration
p0122 A82-11755

AMON, D. M.
Project demonstration of wind-turbine electricity: Interconnecting a northern Michigan fruit farm with a major utility
[DE81-030950] p0138 N82-11380
ANANDALINGAM, G.
Project impact analysis as an optimal control problem
[DE81-028465] p0021 N82-12842
ANDER, M. E.
Hot dry rock geothermal prospects, 1981
[DE81-025305] p0119 N82-15559
ANDERSON, B.
Incremental cooling load determination for passive direct gain heating systems
[DE81-029882] p0081 N82-15575
ANDERSON, J. E.
An energy saving transit concept for new towns
p0005 A82-15665
ANDERSON, M.
Peat resource evaluation: State of Maine
[DE82-000227] p0109 N82-12523
ANDERSSON, B.
Verification of BLAST by comparison with measurements of a solar-dominated test cell and a thermally massive building
[DE81-029883] p0082 N82-15578
ANDREEV, V. M.
Gallium-arsenic-antimony heterojunction photocells
p0055 A82-14667
ANDREWS, J. W.
DOE solar-assisted heat-pump program: Its evolution and its potential
[DE81-026055] p0067 N82-11413
ANDRYCZYK, R. W.
Rectenna system design
p0149 N82-12561
ANG, P. G. P.
Electrochemical photovoltaic cells
[DE81-769704] p0066 N82-10568
ANGERMAN, H.
Overview of active solar absorption/Rankine cooling program
[DE81-028041] p0082 N82-15577
ANGUS, H. C.
Rechargeable metallic hydrides for hydrogen storage
p0085 A82-17150
ANGWIN, M. J.
Development of a high-temperature durable catalyst for use in catalytic combustors for advanced automotive gas turbine engines
[NASA-CR-165396] p0142 N82-13510
APARISI, R. R.
Prospects for the development of solar energy in the USSR Production of electric power by thermodynamics methods
p0039 A82-10385
System of tolerances for a solar-tower power station
p0053 A82-13717
APPELBAUM, J.
Performance analysis of d.c.-motor-photovoltaic converter system. II - Series and shunt excited motors
p0043 A82-11213
ARGABRIGHT, T. A.
Lightweight hydrides for automotive storage of hydrogen
p0084 A82-11790
ARGOUD, M. J.
Solar concentrator panel and gore testing in the JPL 25-foot space simulator
[AIAA PAPER 81-2534] p0054 A82-14005
ARIPULIN, A. C.
Jet fuel from carbon
p0090 A82-12021
ARMSTRONG, R. C.
Energy conservation in distillation
[DE81-028650] p0018 N82-12581
ARNDT, G. D.
Antenna optimization and cost consideration for the Solar Power Satellite microwave system
p0145 A82-11744
System performance conclusions
p0146 N82-12539
ARNDT, R. A.
High- and low-resistivity silicon solar cells
p0046 A82-11762
ARNEY, B. H.
Hot dry rock geothermal prospects, 1981
[DE81-025305] p0119 N82-15559
ARORA, J. D.
Dependence of minority carrier diffusion length on illumination level and temperature in single crystal and polycrystalline Si solar cells
p0053 A82-13804
ARORA, N. K.
Grain size dependence of the photovoltaic properties of solar grade polysilicon
p0057 A82-16051
ASH, D. L.
Geothermal reservoir assessment: Northern basin and range province Stillwater prospect, Churchill County, Nevada
[DE82-000529] p0109 N82-12516
ASHARE, E.
Biomethanation of biomass pyrolysis gases
[DE82-000238] p0113 N82-13541
ASHMAN, E. M.
Solar energy system performance evaluation: Montecito Pines, Santa Rosa, California, November 1979 - April 1980
[DE81-028175] p0068 N82-11561
ASMON, I.
Market assessment of photovoltaic power systems for agricultural applications in Mexico
[NASA-CR-165441] p0007 N82-10506
Market assessment of photovoltaic power systems for agricultural applications in Morocco
[NASA-CR-165477] p0077 N82-14627
ATHEY, G. F.
Numerical wind-speed simulation model
[DE82-000956] p0113 N82-13627
Wind speed simulation for economic evaluation of wind energy conversion systems
[DE81-030077] p0119 N82-15560
ATOR, J. T.
A method for preliminary evaluation and sizing of solar thermal cogeneration system applications
[AIAA PAPER 81-2551] p0054 A82-14014
AUDAS, H.
Investigation of the performance of an MoS2/I-/I2/C electrochemical solar cell
p0053 A82-13805
AUSTIN, S.
Parallel evaluation of air-and oxygen-activated sludge
[PB81-246712] p0034 N82-15633
AVERY, W. H.
Alternative ocean energy products and hybrid geothermal-OTEC /GEOTEC/ plants
[AIAA PAPER 81-2547] p0128 A82-14012
AWAYA, H.
Configuration selection study for isolated loads using parabolic dish modules
[AIAA PAPER 81-2549] p0061 A82-18223
AYAD, S. S.
A numerical model for the flow within the tower of a tornado-type wind energy system
p0131 A82-14844
AYER, F. A.
Symposium proceedings: Environmental aspects of fuel conversion technology, 5th
[PB81-245045] p0034 N82-15623
Proceedings: Symposium on Flue Gas Desulfurization, volume 1
[PB81-243156] p0035 N82-15651
Proceedings: Symposium on Flue Gas Desulfurization, volume 2
[PB81-243164] p0035 N82-15652
AYERS, J. B.
Study of photovoltaic cost elements. Volume 1: Executive report. Volume 2: Project background
[DE81-030982] p0069 N82-11566
Study of photovoltaic cost elements. Volume 3: Sandia National Laboratories photovoltaic systems design catalog
[DE81-030986] p0069 N82-11567
Study of photovoltaic cost elements. Volume 4: Installation cost model for residential PV systems: Users manual
[DE81-031921] p0069 N82-11568
Study of photovoltaic cost elements. Volume 5: Installation cost model for intermediate PV systems: Users manual
[DE81-030981] p0069 N82-11569

B

BACCEI, B. C.
Solar explosion
[DE81-026086] p0074 N82-12628

BACHMANN, K. J.
Oxide optimization at the p-Si/aqueous electrolyte interface
p0052 A82-15199

BACK, L. H.
Dish stirling solar receiver combustor test program
[NASA-CR-165017] p0076 N82-13495

BACKHURST, J. R.
Fuel and energy
p0004 A82-15589

BACON, C. F.
Resource assessment of Low and Moderate-temperature geothermal waters in Calistoga, Napa County, California
[DE81-025559] p0109 N82-12518

BADER, J. B.
Measurement of thermal conductivities in coal fluids

An indoor blade test facility for determining the basic aerodynamic properties of Darrieus wind turbine airfoils with test results for an NACA 0015 and a modified section
p0136 N82-10005
Pyrolytic characterization of the organic matter in selected coals and in the Devonian shales of southern West Virginia
p0113 N82-13578
WESTINGHOUSE ELECTRIC CORP., CONCORDVILLE, PA.
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 2: Hot component corrosion evaluation
[DE81-903760] p0094 N82-10253
WESTINGHOUSE ELECTRIC CORP., EAST PITTSBURGH, PA.
Economic assessment of advanced central-receiver solar-thermal power systems: Executive summary
[DOE/SF-10601/0] p0074 N82-12624
WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
Development, testing, and evaluation of MHD materials and component designs. Volume 1: Executive summary
[DE81-026203] p0139 N82-11947
WILLIAMS BROS. ENGINEERING CO., TULSA, OKLA.
Sixth Underground Coal-Conversion Symposium
[DE81-027669] p0114 N82-14374
WILLIAMS RESEARCH CORP., WALLED LAKE, MICH.
AGT-102 automotive gas turbine
[NASA-CR-165353] p0140 N82-12444
WISCONSIN CENTER FOR PUBLIC POLICY, MADISON.
SOLPLAN report: An assessment of barriers and incentives to conservation and alternative-energy use in the residential sector in Wisconsin
[DOE/CS-30292/3] p0013 N82-11614
WISCONSIN UNIV., MADISON.
Coal combustion in high convective flows
[DE81-030391] p0106 N82-12194
Survey of proposed methods of burning alcohol in diesel engines
[DE81-025834] p0030 N82-15219
WORCESTER POLYTECHNIC INST., MASS.
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[DE81-023581] p0092 N82-10144
WYLE LABS., INC., HUNTSVILLE, ALA.
An analytical comparison of the efficiency of solar thermal collector arrays with and without external manifolds
[NASA-CR-161852] p0063 N82-10501
Performance evaluation of the solar kinetics T-700 line concentrating solar collector
[NASA-CR-161856] p0063 N82-10502
Evaluation of All-Day-Efficiency for selected flat plate and evacuated tube collectors
[NASA-CR-161866] p0063 N82-10504

Y

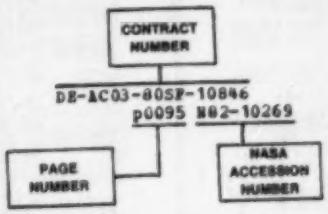
YALE UNIV., NEW HAVEN, CONN.
Development of newer methods for the isolation and identification of certain components found in complex mixtures derived from energy sources and the determination of their biological activity via bioassay systems
[DE81-028311] p0092 N82-10148

Z

ZAVADSKI (EDWARD A.) LTD., MCMURRAY, PA.
Preliminary study: Use of low-sulfur coal and coal cleaning in control of acid rain
[DE81-026930] p0021 N82-12675

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

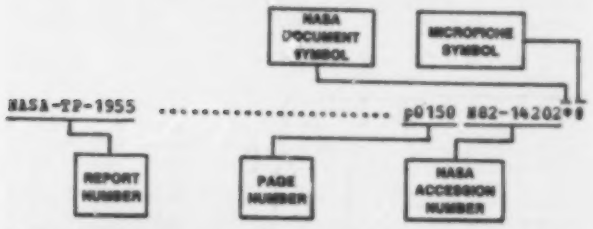
REPORT/ACCESSION NUMBER INDEX

Typical Report / Accession Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the actual page where the citation may be located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

A CONTINUING BIBLIOGRAPHY WITH INDEXES

Issue 34

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced between April 1 and June 30, 1982 in

- ***Scientific and Technical Aerospace Reports (STAR)***
- ***International Aerospace Abstracts (IAA).***

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

This supplement is available as NTISUB/026/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $15.00 domestic; $30.00 foreign.

INTRODUCTION

This issue of *Energy: A Continuing Bibliography with Indexes* (NASA SP-7043(34)) lists 1015 reports, journal articles, and other documents announced between April 1, 1982 and June 30, 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*. The first issue of this continuing bibliography was published in May 1974.

The coverage includes regional, national and international energy systems; research and development on fuels and other sources of energy; energy conversion, transport, transmission, distribution and storage, with special emphasis on use of hydrogen and of solar energy. Also included are methods of locating or using new energy resources. Of special interest is energy for heating, lighting, for powering aircraft, surface vehicles, or other machinery.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The entries are arranged in eight major categories, with *IAA Entries* preceding *STAR Entries* in each category. The citation, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* or *STAR* including the original accession numbers from the respective announcement journals. This procedure, which saves time and money accounts for the slight variation in citation appearances.

Five indexes -- subject, personal author, corporate source, contract number, and report number -- are included.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche[1] of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

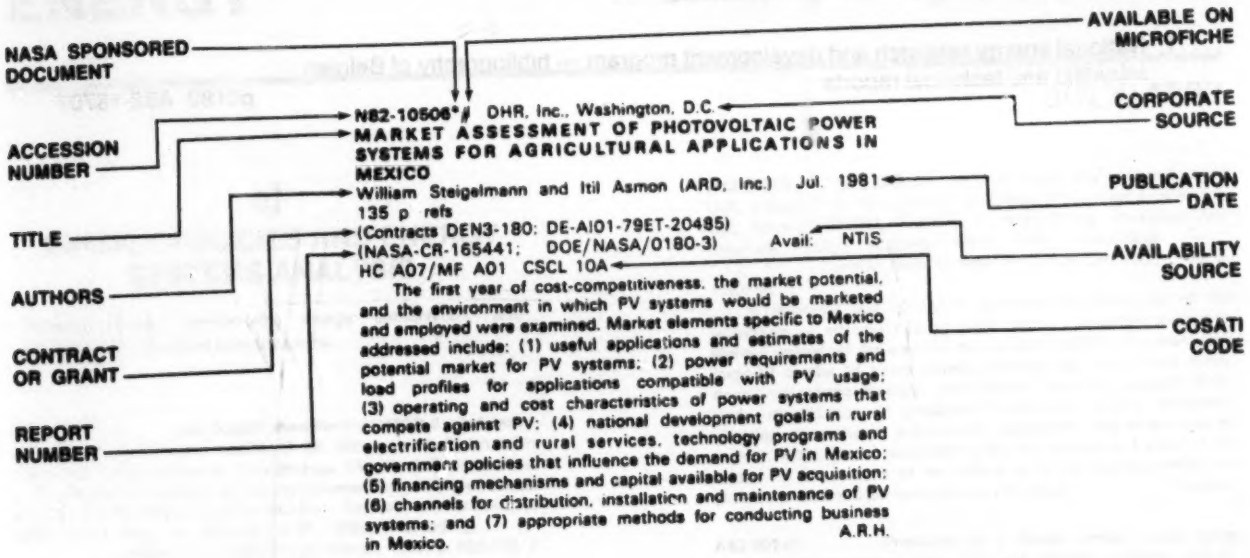
TYPICAL CITATION AND ABSTRACT FROM *STAR*

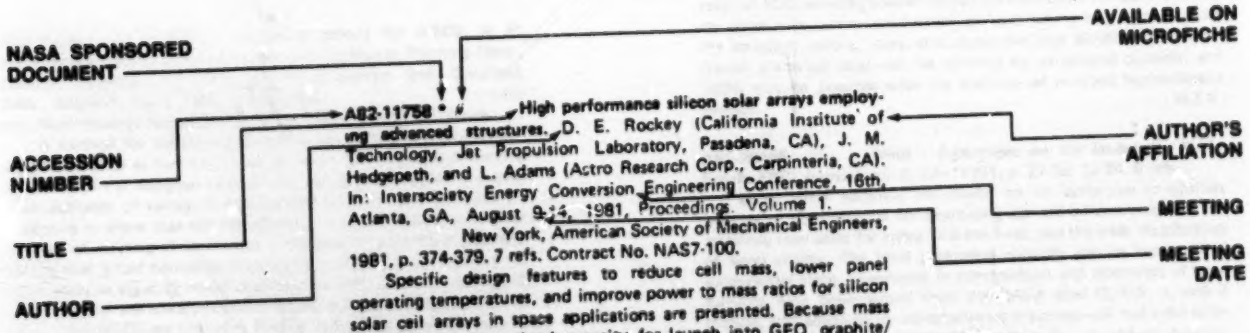


N82-10506*# DHR, Inc., Washington, D.C.
MARKET ASSESSMENT OF PHOTOVOLTAIC POWER SYSTEMS FOR AGRICULTURAL APPLICATIONS IN MEXICO
William Steigelmann and Itil Asmon (ARD, Inc.) Jul. 1981
135 p refs
(Contracts DEN3-180; DE-AI01-79ET-20485)
(NASA-CR-165441; DOE/NASA/0180-3) Avail: NTIS
HC A07/MF A01 CSCL 10A

The first year of cost-competitiveness, the market potential, and the environment in which PV systems would be marketed and employed were examined. Market elements specific to Mexico addressed include: (1) useful applications and estimates of the potential market for PV systems; (2) power requirements and load profiles for applications compatible with PV usage; (3) operating and cost characteristics of power systems that compete against PV; (4) national development goals in rural electrification and rural services, technology programs and government policies that influence the demand for PV in Mexico; (5) financing mechanisms and capital available for PV acquisition; (6) channels for distribution, installation and maintenance of PV systems; and (7) appropriate methods for conducting business in Mexico.

A.R.H.

TYPICAL CITATION AND ABSTRACT FROM *IAA*



A82-11758 * # High performance silicon solar arrays employing advanced structures. D. E. Rockey (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA), J. M. Hedgepeth, and L. Adams (Astro Research Corp., Carpinteria, CA). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 374-379. 7 refs. Contract No. NAS7-100.

Specific design features to reduce cell mass, lower panel operating temperatures, and improve power to mass ratios for silicon solar cell arrays in space applications are presented. Because mass constraints limit payload capacity for launch into GEO, graphite/epoxy structures combined with high performance Si cells are needed to deliver a power/mass ratio of 265 W/kg, notably for Solar Electric Propulsion systems, compared with existing level of 65 W/kg. Shallow diffusion and back surface field cell technology have raised cell efficiencies to 15%, with a back emissivity of 1.64. Structural design requirements comprise Shuttle interface compatibility, full ground test capability, low mass, and high stiffness. Three array alternatives are discussed, and the STACBEAM configuration, which consists of a triangular truss and a piston deployer with folding accomplished on simple hinges, provides 0.2 Hz stiffness and achieves the design power/mass goals.

01
ENERGY POLICIES AND ENERGY SYSTEMS ANALYSIS

Includes energy requirements, energy conservation, and environmental impacts of energy systems.

A82-19053 # An impact assessment of MOD-2 wind generators on the TVA power system. D. W. Hilson, N. D. Sadanandan (Tennessee Valley Authority, Chattanooga, TN), H. M. Sendaula, and R. R. Johnson (Tennessee, University, Chattanooga, TN). In: Annual Allerton Conference on Communication, Control, and Computing, 18th, Monticello, IL, October 8-10, 1980, Proceedings. Urbana, IL, University of Illinois, 1980, p. 196-205. 7 refs. Contract No. DE-AI01-79ET-23077.

The impact of significant amounts of wind generation on the daily operations of an electric power system is currently being investigated by the Tennessee Valley Authority (TVA) under sponsorship of the Department of Energy. This paper describes the characteristics and daily operations of the TVA system without wind, and summarizes the preliminary findings when simulating a reconfiguration of the transmission system to accommodate wind generation. The ongoing activities for simulation and analysis of the operation of the TVA system with wind generation are also briefly outlined. (Author)

A82-19112 System economic theory for WECS. A. P. Rockingham (Central Electricity Generating Board, Planning Dept., London, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 109-117. 6 refs.

A method for evaluating the design of wind energy conversion systems (WECS) as fuel and capacity savers for utilities is presented. A criteria of the marginal value of the WECS to the system is chosen as an indicator of savings in total system expense. Cost polygons are employed to show that the net effective cost is at a minimum when the cost of meeting an increment in demand at peak hour is lowest. Noting that actual operating experience with WECS is necessary for the validity of capacity credit analyses, the difficulties in maintaining optimum heat use loads in conventional plants due to fluctuations of input from WECS are outlined. Finally, it is shown that the cost of added WECS plants will decline as the number of WECS decreases, while the total capacity and the cost of power will remain the same. M.S.K.

A82-19118 The Hull wind powered housing project. D. C. Hodges (Hull College of Higher Education, Hull, Yorks., England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 163-172.

This paper will describe a proposed scheme in Hull to utilize a medium scale wind generator to provide a large portion of the space and water heating requirements for a group of 32 highly insulated local authority houses. The proposed system to achieve this will be described, followed by analysis of the advantages of such systems and an estimate of their possible application. (Author)

A82-19119 Offshore siting of wind turbine generators in U.K. waters. P. B. Simpson and D. Lindley (Taywood Engineering, Ltd., Southall, Middx., England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 173-185.

A technical and economic assessment is described of the generation of electricity using wind turbine generators located in shallow waters off the coast of the United Kingdom. The assessment involved studies of siting criteria, meteorology, sea surface conditions, engineering geology, construction materials, support structures, marinisation of complete installations, cluster efficiency, electrical transmission and control, availability and environmental aspects. Estimates of generation costs are quoted and some of the results of an analysis of the influence of various parameters on generation cost and performance are described. (Author)

A82-20141 Potential for a Danish power system using wind energy generators, solar cells and storage. S. Blegaa and G. Christiansen (Danmarks Tekniske Hojskole, Lyngby, Denmark). *International Journal of Ambient Energy*, vol. 2, Oct. 1981, p. 223-232. 9 refs.

Performance characteristics of a combined solar/wind power system equipped with storage and an unspecified back-up power source are studied on the basis of meteorological data in Denmark from 1959-1972. A model for annual production and storage from wind/solar installations is presented, assuming 12% efficiency for the solar cells and various power coefficients of the windmills, in addition to long and short-term storage. Noting that no correlation between wind and solar energy availability was found, and a constant ratio of 60% wind/40% solar was determined to be the optimum mix for large scale power production without taking into consideration the variations among years. It is concluded that 80-90% of the total Danish electrical load can be covered by solar/wind systems, and 100% may be possible with the addition of pumped hydroelectric storage. M.S.K.

A82-20166 Wind - Prototypes on the landscape. M. L. Smith. *EPRI Journal*, vol. 6, Dec. 1981, p. 27-30, 32-34. 6 refs.

Large wind turbines are shown to be attractive to utilities because of the potential for decreasing gas and oil consumption, the relatively low costs for entry into the field, and the wide distribution of wind energy. The total generating capacity can be increased in incremental steps, experience in construction and operation of large turbines have been gained from the NASA Mod O, OA, 1, and 2 models, and advances in manufacturing processes will make the large turbines competitive as replacement power for oil and gas burning utility generators. The 300 ft rotor Mod 2 machines are described, along with designs for the Mod 5A and Mod 5B wind turbines, with 400 and 422 ft, 6.2 and 7.2 MW rotors and outputs, respectively. Current plans for multi-MW windfarms are reviewed, and the option of using the land around large wind turbines for other purposes is stressed. M.S.K.

A82-20207 # Advantages of permanent magnet VSCF generating systems on aircraft fuel economy. J. J. O'Neill (General Electric Co., Aircraft Equipment Div., Binghampton, NY). *Journal of Energy*, vol. 6, Jan.-Feb. 1982, p. 34-37. 8 refs. USAF-sponsored research.

Permanent magnet aircraft electrical generating systems offer many advantages to both the aircraft designer and the user. These systems are typically smaller, lighter, and more reliable. Another

advantage, which until recently has been overlooked, is the higher efficiency of this type of system. This paper examines the effect of the higher efficiency on aircraft fuel consumption. Data for several system sizes are presented as well as several techniques for calculating such parameters as differential power extraction, cost savings per hour, and total cost savings. (Author)

A82-20513 Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1981. 77 p.

Topics discussed include design possibilities for improved fuel efficiency of civil transport aircraft, energy management in military combat aircraft, and the control of aircraft gas turbines for fuel economy. Particular attention is given to the impact of increasing cost upon the design of avionic fuel management systems and the operational and performance aspects of fuel management in civil aircraft. Consideration is also given to the FS2 Bedford Civil Flight Research Program as well as current and future developments in thrust management. J.F.

A82-20514 Design possibilities for improved fuel efficiency of civil transport aircraft. D. H. Jagger (Airbus Industrie, Blagnac, Haute-Garonne, France). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 9 p.

The possible application and potential benefits of various technical advances in aerodynamics, structures, and propulsion for the reduction of fuel usage in future Airbus aircraft are discussed. In particular, technical comparisons and tradeoffs in terms of fuel economy are considered for a hypothetical medium-range project aircraft of the 1980's. Improvements in fuel used per passenger at 1,000 n.m. range over two successive periods of 20 years are estimated. A breakdown of the objectives, time-scales, and costs of various parts of the current NASA Aircraft Energy Efficiency Program is also given. This features such improvement as propulsion/aerodynamic integration winglets, the use of advanced composite materials, drag cleanup, structural-duct integration, minimum suction-natural laminar flow, reduction of engine performance losses, and active controls for load alleviation. J.F.

A82-20515 Energy management in military combat aircraft. J. W. Lyons (British Aerospace Public, Ltd., Co., Aircraft Group, Brough, Humberside, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 6 p. 5 refs.

Energy management is important not only for fuel economy, but for efficient three-dimensional maneuvering capabilities as well. The principles of several new techniques for energy efficient three-dimensional maneuvers in combat aircraft are discussed. Efficient turbofan engines have been adopted which are electronically controlled for achieving precise thrust settings within engine limits. Engine bleed can be better controlled, and hydraulic pressure control, resulting in reduced mechanical offtakes from the engine, is now possible using microprocessors. Self-healing systems can be used in the battlefield scenario, and advanced display concepts are being employed to make better use of available maneuver energy. These techniques individually result in greater efficiency, but together they provide significant synergistic improvements. J.F.

A82-20516 The control of aircraft gas turbines for fuel economy. D. J. Lee (Rolls-Royce, Ltd., Bristol, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 7 p.

Electronic controls are important to the fuel efficient aircraft of the future as sophisticated fly by wire controls, flight management systems, and complex ATC navigation systems. The functions obtainable using electronic controls are often more complex and more flexible than those produced with hydromechanical systems. They provide greater accuracy in staying within temperature and stress limitations, as well as increased fuel economy. Electronic engine control is also very cost effective over the life of the unit and has the benefit of reducing the pilot workload. Microprocessors have made the use of digital technology for engine control more popular; the benefits of digital control may be seen in terms of improved accuracy, fault diagnostics and tolerance, fuel-type variations, system complexity, and airframe integration. Finally, engine health monitoring systems are used for the programmed maintenance of mechanical parts of gas turbines. J.F.

A82-20517 The impact of increasing energy costs upon the design philosophy of avionic fuel management systems. P. R. Thrift (Smiths Industries Aerospace and Defence Systems Co., London, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 9 p.

Parameters of fuel quantity remaining and rate-of-usage are determinate factors in the operational range of any aircraft. Methods for designing engines with lower fuel consumption, and airframes with lower drag coefficients to minimize the mass of fuel to be carried are being investigated. Operating costs may be reduced by using unused portions of fuel as dynamic balast to control the center of gravity throughout a flight profile. Fuel consumption can also be reduced by control of the aircraft's complete flight envelope. Strategies for measuring fuel mass and determining fuel density are discussed. Means of improving the twin concentric circular cross section transducers are discussed, and the production of a fault tolerant system by the incorporation of two computer systems is described. Finally, the use of microprocessors to control the center of gravity and to detect fuel leaks is discussed. J.F.

A82-20518 Operational and performance aspects of fuel management in civil aircraft. H. P. K. Dibley (British Airways, Hounslow, Middx., England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 13 p.

In order to carry maximum payload at minimum cost, an airline must find means of optimizing fuel purchasing, pre-flight planning, and in-flight procedures. Accurate forecasting and monitoring of fuel costs is needed to obtain adequate fuel supplies at the best price, to maximize uplift at cheap stations, and to show the effect of outages of uplift stations. Pre-flight planning is used to determine the route for minimum fuel consumption and to calculate the maximum take-off weight. Minimization of fuel consumption during flight can be achieved by (1) presentation of optimum climb, cruise and descent information; (2) flight management systems coupled to the autopilot; (3) optimizing the use of engine climb derate; (4) improving navigational accuracy; (5) presentation of more navigation parameters to the pilot; (6) vertical navigation; and (7) minimizing noise and fuel consumption on approach. J.F.

A82-20520 Thrust management - Current achievements and future developments. J. L. Weston (Smiths Industries Aerospace and Defence Systems Co., Cheltenham, Glos., England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 12 p.

A system architecture has been developed to provide a fuel efficient full-flight regime auto-throttle system and a second generation flight management computer system. The auto-throttle system is capable of controlling the engine throttle levers from before take-off until touchdown as well as providing command signals to the aircraft flight director system. The operation modes of the system include take-off, climb, cruise, descent, maximum continuous thrust, hold, approach and go-around. The flight management computer system is responsible for the overall operation of the aircraft between the take-off location and the destination point. Its eight major functions are (1) flight planning; (2) navigation; (3) control of VOR/DME receivers; (4) lateral guidance; (5) vertical path optimization; (6) vertical guidance; (7) look ahead information; and (8) provision of information to support the electronic flight instrument system. J.F.

A82-20644 Environmental effects of the Satellite Power System Microwave Power Transmission System. A. R. Valentino

(Argonne National Laboratory, Argonne, IL) and M. M. Abromavage (IIT Research Institute, Chicago, IL). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 3.
New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 48.5.1-48.5.4.

The potential environmental effects of the Satellite Power System (SPS) Microwave Power Transmission System (MPTS) have been studied as a part of the SPS Concept Development and Evaluation Program (CDEP). A number of issues have been identified including: health effects due to microwave exposure for the public as well as the SPS worker; effects on telecommunications due to ionospheric changes caused by the passage of the microwave beam; and electromagnetic compatibility with military systems, radio astronomy, satellite systems, and electronic systems in general. Assessments have been prepared based on existing data, and none of the issues precludes the continued study of SPS technology. To increase the certainty of the assessment, some research has been initiated and long-term research is being planned. (Author)

A82-20757 **General aviation fuel consevation in the 1980's.** G. R. Bromley (Beech Aircraft Corp., Wichita, KS). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 9-1 to 9-22.

Techniques for conserving fuel in-flight are given from a flight engineer's point-of-view, noting that aircraft designs will increasingly incorporate cleaner aerodynamics and better engine-to-airframe matching. The effects of wind and temperature at various altitudes and fuel consumption in ascent and descent are considered, and methods for determining maximum range airspeeds are developed, particularly for choosing long-range cruise airspeeds. Specific charts are presented for private pilots in general aviation aircraft, relating wind, no-wind, and tailwind conditions as regards to fuel consumption. M.S.K.

A82-20764 **A study of the suitability of the all fiberglass XV-11A aircraft for fuel efficient general aviation flight research.** G. Bennett (Mississippi State University, Mississippi State, MS). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 18-1 to 18-15. 8 refs.

The impact of rapidly rising fuel prices upon future general aviation aircraft requirements is explored. The current configuration of the fiberglass XV-11A aircraft is presented and it is shown that the aircraft can become a cost effective testbed for fuel efficient general aviation aircraft configurations. Several suitable research tasks for the aircraft are defined. A low cost method to produce master wing molds is proposed. (Author)

A82-20874 * # **Advanced subsonic transport propulsion.** D. L. Nored, C. C. Ciepluch, R. Chamberlin, E. T. Meleason, and G. A. Kraft (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, ASCE, ATRIF, and TRB, International Air Transportation Conference, Atlantic City, NJ, May 26-28, 1981, AIAA Papar 81-0811.* 30 p. 5 refs.

Examination of future subsonic commercial aircraft propulsion trends begins with a brief review of the current NASA Energy Efficient Engine (E3) Project. Included in this review are the factors that influenced the design of these turbofan engines and the advanced technology incorporated in them to reduce fuel consumption and improve environmental characteristics. In addition, factors such as the continuing spiral in fuel cost, that could influence future aircraft propulsion systems beyond those represented by the E3 engines, are also discussed. Advanced technologies that will address these influencing factors and provide viable future propulsion systems are described. And finally, the potential importance of other propulsion system types, such as geared fans and turboshaft engines, is presented. (Author)

A82-21225 **Renewable energy - Target for 2050.** W. D. Rowe (American University, Washington, DC). *IEEE Spectrum,* vol. 19, Feb. 1982, p. 58-63. 10 refs.

The possibilities of various renewable energy technologies to supply a projected world demand for 40,000 GW years of energy each year by the year 2050 are examined. Noting that industrial processes consume 50% of all energy needs, fossil fuel reserves are shown to be sufficient for a maximum of 370 yr in the U.S., when all supplies become depleted. Breeder reactors have a doubling time which is 30 yr too long for meeting more than 0.5% of world energy demand in 2050, while fusion, even considering ocean-derived deuterium as a fuel source, will not be supplying energy for another 35-70 yr. Among the solar technologies, the installation of ten million 100 m tall 4 MW wind generators is feasible to meet all the projected energy needs, and solar cells with 10% conversion efficiency could do the same with 14 times less land. Further discussion is given to geothermal, fuel cell, and OTEC technologies, as well as the forty trillion dollars necessary to erect the fully renewable systems. M.S.K.

A82-21362 **Government-industry relationships in technology commercialization - The case of photovoltaics.** J. D. Roessner (Georgia Institute of Technology, Atlanta, GA). *Solar Cells,* vol. 5, Jan. 1982, p. 101-134. 34 refs. NSF-supported research.

Interfaces between the U.S. government and the emerging photovoltaics industry are examined in terms of basic research programs, market studies, and strategies to accelerate the development of the industry. The process of the development of a model industry is outlined from innovation to large-scale, specific use production, and DOE programs are noted to shift from R and D, testing, and evaluation programs to market tests, demonstrations, and workshops when a product becomes commercially ready. The growth of funding for research, technology development, and purchases to gain operational experience with solar cell arrays is traced, and it is noted that firms specializing in photovoltaics production have managed to continue with irregular government funding and normal, private financing arrangements. Government procurement is suggested to have the greatest impact on a new industry, especially when coupled with performance and reliability requirements. M.S.K.

A82-21373 * # **We have just begun to create efficient transport aircraft.** D. J. Maglieri and S. M. Dollyhigh (NASA, Langley Research Center, Aeronautical Systems Div., Hampton, VA). *Astronautics and Aeronautics,* vol. 20, Feb. 1982, p. 26-38. 21 refs.

Factors affecting the cost-effectiveness and economics of the air transportation industry are reviewed. The delivery of more fuel-efficient aircraft and eventual total replacement in the 1990's by fleets of advanced aircraft are seen to offset rising fuel costs. Better airport operations are perceived to eliminate fuel-costly delays due to overcrowded runways, lack of available carriers, and maintenance of aircraft in holding patterns. Noise reduction research will lower the lawsuit costs from noise pollution, and the introduction of advanced turbofans for long, short, and medium range flights, advanced commuter planes, and advanced SSTs offering projected 50% increases in current aircraft efficiencies are seen to be limited only by the airlines' ability to provide purchase financing, rather than by a lack of available new technology. M.S.K.

A82-22097 # **Testing of the low mass flow test train in the DOE Coal Fired Flow Facility.** G. D. Smith, R. J. Schulz, and N. R. Johanson (Tennessee, University, Tullahoma, TN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0378.* 12 p. 7 refs. Contract No. DE-AC02-79ET-10815.

The initial shakedown testing and evaluation of The Department of Energy (DOE) Coal Fired Flow Facility and the Low Mass Flow Magnetohydrodynamic Test Train are described. The testing included system and component performance determination and initial evaluation of the NO(x) relaxation through the flow train and SO2 level existing in the exhaust. Satisfactory performance was obtained from the facility systems and flow train components including the vitiation heater, coal fired combustor, radiant slagging furnace and secondary combustor. The effect of primary stoichiometry and N/O ratio on NO(x) levels throughout the flow train was clearly demonstrated. The exhaust stack NO(x) and SO2 levels for coal-fired operation are shown to be well below current EPA limits. Heat flux and wall static pressure distributions along the flow train are

presented and were found to be consistent with previous experience in a smaller research facility. The facility is operational as a test facility for coal and oil fired combustion systems and is capable of operation over a range of conditions from 100% coal to 100% fuel oil or any combination of coal/fuel oil mixture. (Author)

A82-24025 **Air transport in the 21st century.** K. G. Wilkinson. *Aerospace* (UK), vol. 9, Jan. 1982, p. 18-23. 8 refs.

Trends in aircraft design into the 21st century are discussed, based on the driving need for higher fuel efficiency and alternative fuels. Noting that fuel presently accounts for 30% of air transportation, results of an international study on the world energy supply and growth are used to present several scenarios of future aerospace operations. Global energy is projected to be provided from renewables and nuclear, coal and gas, and oil, each group producing 1/3 of the world energy demands, with aerospace consuming 3% of the total oil consumed. Advances in aerodynamics from NASA studies, in lightweight synthetic materials, in active controls, and in propulsion systems are outlined, with mention made of the CO2 contribution to a global rise in temperature. The development of nuclear technology and the availability of nuclear fuels is contrasted against the environmental costs of using hydrocarbon fuels, and the necessity of developing a hydrogen-based fuel economy is emphasized. M.S.K.

A82-24075 # **Stack gases desulphurization recovery processes in thermal power plants of the world. III - Processes based on absorption by solid materials.** S. Kumar (Banaras Hindu University, Varanasi, India). *Indian Journal of Environmental Protection*, vol. 1, July 1981, p. 162-165. 17 refs.

A review of processes involving entrained contactor systems and efficient dust recovery equipment for desulfurization recovery in the stacks of thermal power plants is presented. The alkalized alumina process involves the contact of the stack gas with the absorber in an entrained solid reactor at high temperature. The removal of SO2 occurs from 130-330 C by means of alkalized alumina with an active ingredient of sodium oxide. The DAP-Mn process comprises an absorption tower for the stack gases and a magnesium oxide absorber. Manganese sulphate is formed in the tower for collection in a multicyclone collector or an electrostatic precipitator. The absorber is later recycled. The Grillo process has an absorbent deposited on a carrier such as coke and contacted with stack gas in a moving bed absorber. Finally, the Sill process is examined for the absorber contact in an entrainment reactor, using high-calcium lignite ash for an absorber. M.S.K.

A82-24304 **Fuel-efficient windshields for transport, commuter and business aircraft.** G. L. Wiser (Sierracin Corp., Sylmar, CA). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 25-95. 34 refs.

The effects of weight and drag reduction measures involving windshields and their associated structures and systems on fuel efficiency are explored. It is shown that the incorporation of these techniques can save up to 80,000 gallons of fuel/year per aircraft in wide-body commercial aircraft applications, and 12,000 gallons/year per aircraft in the case of commuter designs. The alternatives considered include (1) flat glass windshields, (2) curved glass windshields, (3) curved high-strength glass windshields, (4) structurally-integrated curved windshields, (5) curved stretched acrylic windshields, (6) curved, chemically-strengthened glass windshields, and such associated systems as temperature controllers and rain removal. O.C.

A82-24394 **Management of powerplant maintenance and restoration programs for fuel conservation.** C. Reid (General Electric Co., Fairfield, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811052.* 15 p.

Powerplant operational and maintenance procedures are reviewed to minimize fuel consumption and total operating costs of existing large turbofan engines. Recommendations are made to reduce the rate of on-wing performance deterioration and to define cost effective performance refurbishment. Measures being taken to increase fuel and cost savings include the development of performance diagnostic/analytical systems to permit better management control of engine operating costs. On-wing performance retention can be improved by the observance of line maintenance and operational procedures minimizing the impact of the major causes of performance deterioration, such as increased clearances, erosion, contamination and leakage. D.L.G.

A82-24395 **Airline fuel saving through JT9D engine refurbishment.** J. W. Allison and D. R. Weisel (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811051.* 12 p.

Since the JT9D engine entered airline service in 1970, increase in the price of jet fuel made it imperative to devise refurbishment procedures for in-service engines to improve their fuel economy. Developments leading to performance recovery and improvement of the engine are related to fan leading edge rework, and the one degree open first stator. Factors responsible for engine performance recovery and retention include also operational procedures, test configuration, and prevention of aircraft system pneumatic leakage. Attention is given to the fan strip panel concentric grinding tool, a properly repaired combustor with recently developed 'S-16' fuel nozzles, recommended refurbishment additions, operational procedures to maximize performance retention, a test configuration, and inspection techniques. G.R.

A82-24604 # **Magnetohydrodynamics and its hazard assessment.** W.-T. Chan. *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Saf-3.* 7 p. 34 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Montana Energy and Magnetohydrodynamics Research and Development Institute.

Potential occupational and environmental hazards of a typical combined open-cycle MHD/steam cycle power plant are critically assessed on the basis of direct/indirect research information. Among the potential occupational hazards, explosion at the coal feed system or at the superconducting magnet; combustor rupture in a confined pit; high intensity dc magnetic field exposure at the channel; and combustion products leakage from the pressurized systems are of primary concern. While environmental emissions of SO(x), NO(x) and fine particulates are considered under control in experimental scale, control effectiveness at high capacity operation remains uncertain. Gaseous emission of some highly toxic trace elements including radioactive species may be of concern without gas cleaning device in the MHD design. (Author)

A82-24683 **The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980.** Conference sponsored by the Institute of Electrical and Electronics Engineers. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. 192 p. Members, $22.50; nonmembers, $30.

Technical and economic problems were addressed for developing technologies which hold promise for replacing world demand for oil based fuels. Monitoring and analysis of conservation measures were discussed, along with new sources of fossil fuels, and energy from OTEC and fusion power plants. Geothermal plant siting, construction, and operation were examined, and MHD prototype plants were described. The applications and social effects of energy storage systems were explored, along with biomass potentials and methods, solar thermal energy systems, and topics relevant to fission reactor power systems. Finally, the development and assessment of fuel cells for commercial and utility applications were described, and IEEE position papers were presented on reactors, safety, cogeneration, SPS, and solid waste energy sources. M.S.K.

A82-24686 **OTEC power system development and environmental impacts.** N. F. Sather (Argonne National Laboratory, Argonne, IL). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 50-55. 6 refs.

The costs, materials, maintainability, and environmental impacts of prospective OTEC plants are reviewed, along with developmental time tables. The plants are noted to cost almost three times per KW

installed power as conventional coal or nuclear plants on land, with main expenses derived from the massive heat exchangers, which must necessarily be 500 times the size of those in conventional power plants. The issue of biofouling in the heat exchangers is addressed, and mechanical scrubbers, recirculating sponge balls, and low-level chlorination are suggested as possible solutions. A 10-40 MW installation is projected to be completed by 1984, and is intended for confirming the validity of OTEC concept for large-scale power generatinn, to test the methods of preventing biofouling, and to establish monitoring instrumentation for avoiding ammonia leaks from the working cycle into the ambient ocean. M.S.K.

A82-24687 **Geothermal resource field development.** T. Amor (Thermal Power Co., San Francisco, CA). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 71-73.

The procedures for siting, constructing, and maintaining geothermal power plants are examined, with regard for the economic and environmental parameters. An initial survey involves leasing 10,000 acres of land to drill wells to depths of 5000-7000 feet in search of 340-400 F heat in the form of water or steam. The first well costs from $700,000-1,200,000, and is required to yield a steam flow rate of 100,000 lb/hr to indicate economic feasibility. Generating units are chosen in the 20-55 MW range, and in the case of the Geysers Project 15 wells delivering two million lb/hr are used to drive 110 MW generating units, each installation costing $20,000,000. Fluids are reinjected into the substrate to prevent subsidence of the land around the site and may actually extend the life of the resource. Problems with hydrogen sulfide abatement techniques are noted to decrease plant efficiencies and have not been solved. M.S.K.

A82-24688 **Geothermal direct use projects.** E. G. DiBello (EG & G Idaho National Engineering Laboratory, Idaho Falls, ID). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 75-79.

The history of direct use of geothermal resources is presented, along with an outline of current U.S. based programs. Geothermal fluids have been used to evaporate mineralized water to produce boric acid, for health and bathing, and for district heating. Current programs target applications in agriculture, for fish farming, grain drying, greenhouse heating, soil heating, mushroom growing, and animal husbandry. Industrial uses include timber and diatomaceous earth drying, mineral extraction, dehydration, cement slab curing, pulp and paper processing, and ethanol production. Projects are being monitored for environmental effects, resource assessment, well drilling and evaluation, corrosion, water disposal methods, system design and construction, and operational characteristics. Costs for the heat have been found to span the range of $.45-5.55/GJ, dependent on well depth and temperature, and space heating, commercial processing, and greenhouse heating systems are examined. M.S.K.

A82-24689 **Description of the DOE Coal-Fired MHD Flow Facility /CFFF/.** J. B. Dicks, J. F. Martin, J. W. Muehlhauser, and S. S. Strom (Tennessee, University, Tullahoma, TN). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 81-85.

Components, instrumentation, and operating parameters of the DOE MHD Coal-Fired Flow Facility are described, noting its extension and expansion from a previous prototype plant. The CFFF features three bays for coal delivery, offering hot gas flows of 8 and 30 lb/sec, and a third rate for outside contractor studies. A Low Mass Flow test train is intended for engineering tests of component performance, durability, and scaling parameters. An oxygen-rich gas composed of oxygen, nitrogen, and No. 2 fuel oil will be heated to 1283 K for mixing with pulverized coal, a carrier gas, and a seed material such as potassium carbonate and/or potassium sulfate and burned substoichiometrically to produce an ionized gas. The gas flow is routed through a diagnostic channel to determine the MHD output, plasma uniformity, and gas dynamic conditions. Further systems for slag removal, pollution control, magnetic field generation, and data acquisition are detailed. M.S.K.

A82-24690 **Biomass options for the big island of Hawaii.** P. C. Meagher and E. M. Kinderman (SRI International, Menlo Park, CA). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 92-98.

Potential sources of renewable energy which can serve to displace some of the 500 million dollars spent each year by Hawaii for petroleum products are examined, particularly for biomass opportunities. Solar heating is noted to have minimal impact due to favorable weather conditions, while hydropower potential is limited and wind use, although very appealing, will be limited to a 10-15% contribution to the total due to aesthetic power quality, and land-use considerations. Geothermal is projected to steadily grow to 500 MW production. Sugar plants burn bagasse to produce power totalling 9 MW, while a growing logging industry offers increased forest residue for power production competitive with diesel fueled generators. Bagasse, cane trash, sweet sorghum, and ocean plants for alcohol and ethanol formation are not economically feasible unless coupled to a geothermal heating method for thermochemical conversion, and offers the only alternative for liquid fuels imports. M.S.K.

A82-24696 **From steam to kilowatts - Planning, siting and regulatory considerations in geothermal resource development.** J. F. McKenzie (Pacific Gas and Electric Co., San Francisco, CA). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 166-173.

A82-24803 **Novel metal-ceramics-composite sealing coatings in aircraft engines (Neuartige Metall-Keramik-Verbund-Dichtungsbeläge in Flugtriebwerken).** A. Sickinger and V. Wilms (Motoren- und Turbinen-Union München GmbH, Munich, West Germany). In: Composite materials; Lecture and Discussion Meeting, Constance, West Germany, April 17, 18, 1980, Reports. Oberursel, West Germany, Deutsche Gesellschaft für Metallkunde, 1981, p. 133-140. In German.

Requirements for the enhancement of the performance of aircraft engines and the reduction of fuel consumption make it necessary to operate aircraft engines at higher gas pressures and temperatures. The development of novel metal-ceramics-composite sealing coatings makes it possible to overcome certain problems related to more exacting sealing requirements and greater thermal extension in connection with the new operational conditions. The sealing coating provides a means to compensate for different thermal extensions and manufacturing tolerances existing for rotating and stationary structural components. It is feasible to obtain minimum clearance values and to reduce attrition effects for the rotating component. Other important benefits of the coating are related to its thermal-barrier characteristics. Attention is given to the requirements which the coating has to satisfy, its application by thermal spraying, the coating composition, and some test results. G.R.

A82-25161 **Trade-offs in NO/x/ control.** R. Whitaker. *EPRI Journal*, vol. 7, Jan.-Feb. 1982, p. 18-25.

Mechanisms which produce NO(x) pollutants in coal burning power plants are reviewed, along with methods for lowering the emissions. The pollutant is formed by oxidizing the nitrogen in the combustion air (20-40%) and from burning coal with too lean an air-fuel ratio in initial combustion stages (60-80%). All low-NO(x) furnace designs currently feature staging with, e.g., delayed mixing as the fuel enters or reburning of the gases coming from the furnace. Control adjustments are noted to serve as immediate steps for pollutant reduction in retrofit plants, and tangentially fired boilers have demonstrated NO(x) emissions as low as 0.2 lb/1,000,000 Btu. The selective catalytic reduction process, mentioned as showing the most cost-effective possibilities, is a post-combustion process which achieves a 60-80% reduction in NO(x) flue gas. M.S.K.

A82-25507 **Status and near-term development goal - A solar hydrogen economy.** P. Brennecke, H. H. Ewe, and E. W. Justi

(Braunschweig, Technische Universität, Braunschweig, West Germany). *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, 2nd Semester, 1981, p. 52-57. 14 refs.

The possibilities of total conversion to a world hydrogen-based economy is discussed, noting that economically retrievable coal reserves will be depleted by 2033, at which time a 2-4 C rise in the world atmospheric temperature will have resulted. The removal of large coal, nuclear, and windpowered central generating plants to offshore locations, and solar thermal plants to remote, sunny locations, along with large photovoltaic installations, is recommended as a means of ameliorating the nuissances and dangers of building such facilities near populations. The removal of energy-producing centers from populated areas necessitates long-distance energy transmission, which is noted to be achievable by employing hydrogen gas in natural gas-type transmission pipes. The hydrogen could be produced electrolytically, and an effort during the 1980's to found a common hydrogen pipeline between France and Germany is mentioned. M.S.K.

A82-25660 The Solar Power Satellite - An opportunity for Third World development. R. Mayur and P. E. Glaser (SUNSAT Energy Council, Cold Spring, NY). *(United Nations, Conference on New and Renewable Sources of Energy, Nairobi, Kenya, Aug. 10-21, 1981.) Space Solar Power Review*, vol. 2, no. 4, 1981, p. 329-335. 26 refs.

The application of Solar Power Satellite (SPS) systems in conjunction with other renewable energy configurations such as flat plate collectors, windmills, hydroelectric power stations, OTEC, and photovoltaic cells to alleviate the shortages and costs of energy sources in developing nations is recommended. Education of people in the Third World to potential benefits of space resources exploitation is a way to involve them in space activities in the 21st century. SPS systems are noted to have a potential of freeing millions of tons of manure and firewood for other uses. Potential land-use and legal definitions of GEO problems are indicated, along with the potential for ocean-basing the rectennas to serve as mariculture sites. M.S.K.

A82-25665 Assessing the Solar Power Satellite - The OTA experience. R. A. Williamson, S. Weisburd, and A. Wasserman (Office of Technology Assessment, Washington, DC). *Space Solar Power Review*, vol. 2, no. 4, 1981, p. 383-392. 19 refs.

A review of an Office of Technology Assessment examination of SPS potentials and problems as an energy source is presented, along with an examination of the SPS effects on other space systems. The SPS configuration considered included solar cell conversion to klystron transmission to rectennas, with the solid-state converters located on the back of each solar panel. A LEO-based laser system was also explored, along with LEO-based large mirrors to reflect light to selected spots on the earth. A need for the SPS if energy end-use requirements grow to more than 20 quads by the year 2015 was noted, and economic competitiveness with solar technologies and extent of development of the technology was concluded to be on the same level as fusion. Developing the SPS technology was found to offer significant opportunities for advancing U.S. space technology. M.S.K.

A82-25666 Dust removal from small- and medium-sized coal-fired generators (La dépoussiérage des petites et moyennes chaudières à charbon). R. Bouscaren (Centre Interprofessionnel Technique d'Etudes de la Pollution Atmosphérique, Paris, France). *Pollution Atmosphérique*, vol. 23, Oct.-Dec. 1981, p. 299-312. 11 refs. In French.

The problem of dust removal from the emissions of industrial coal-fired generators of capacity less than 50,000 th/h is considered in light of increasing emphasis on coal as an energy source. Following a brief review of dust emission standards and the characteristics of dust emission prior to purification, means for the reduction of dust production in various types of combustors are examined. The advantages and disadvantages of the various available types of removal systems are surveyed, with attention given to mechanical removal, wet removal, porous layer removal, and electrical removal. Economic aspects of the installation and operation of dust removal techniques are then surveyed. It is recommended that pollution standards be temporarily relaxed in order to promote the use of coal in small installations, while intense efforts be undertaken to develop reliable, affordable equipment for dust removal from exhaust emissions. A.L.W.

A82-25669 Ten years of the fight against air pollution in Japan - Evaluation of a policy (Dix années de lutte contre la pollution de l'air au Japon - Bilan d'une politique). P. Jarrault (Institut Français de l'Energie, Paris, France), A. Pradinaud (Agence Financière Rhin-Meuse, France), and R. Guillet. *Pollution Atmosphérique*, vol. 23, Oct.-Dec. 1981, p. 337-352. 6 refs. In French.

Major aspects of the efforts at air pollution control in Japan over the past 10 years are discussed. Pollution control policy in Japan has been characterized by a basis in sentiment rather than economic considerations, an emphasis on certain types of pollution, enforcement by direct administrative surveillance, the use of indemnity payments to victims and the importance of the local authorities. While mean annual SO2 concentrations have declined from 0.06 to 0.04 ppm from 1965 to 1977, nitrogen oxide levels have increased and stabilized at a level of 0.03 ppm and the air quality standards have been revised upwards. Pollution monitoring is accomplished through national and local networks. Detailed emission standards exist for sulfur dioxide and nitrogen oxides and to a lesser extent solid particles and odorous products, and are met by strategies including emission reduction, fuel and emission desulfurization, taxation of emissions, catalytic conversion, and pollution prevention. A.L.W.

A82-26327 Air pollution control technology - An overview. S. R. Orem (Industrial Gas Cleaning Institute, Inc., Alexandria, VA). *Air Pollution Control Association, Journal*, vol. 32, Mar. 1982, p. 246-249.

An overview is presented of the equipment and economics of pollution control devices for industrial applications. Attention is given to the Venturi scrubber, high order pressure drops, mechanical/centrifugal, cyclonic devices, baghouses, the Hersey reverse jet blow ring, electrostatic precipitators, and flue gas desulfurization. A total of over one and 1/3 billion dollars was spent on air pollution control equipment in 1980. The development of cartridge-type filters filled with synthetic fabrics such as fiberglass mesh for baghouses is reviewed, as is the growth of installed electrostatic precipitator units, totalling 42.274 GW of installed capacity in 1980. A steady growth in the total capacity of scrubbers is foreseen with the tendency for the use of coal as a primary energy source. M.S.K.

A82-26368 Progress on alternative energy resources. H. T. Couch (United Technologies Research Center, East Hartford, CT). *Astronautics and Aeronautics*, vol. 20, Mar. 1982, p. 42-47.

Progress in the year 1981 toward the development of energy systems suitable for replacing petroleum products combustion and growing in use to fulfill a near term expansion in energy use is reviewed. Coal is noted to be a potentially heavy pollution source, and the presence of environmentally acceptable methods of use such as fluidized-bed combustion and gasification and liquefaction reached the prototype stage in 1981, MHD power generation was achieved in two U.S. plants, with severe corrosion problems remaining unsolved for the electrodes. Solar flat plate collectors sales amounted to 20 million sq ft in 1981, and solar thermal electric conversion systems with central receivers neared completion. Solar cells are progressing toward DOE goals of $.70/peak W by 1986, while wind energy conversion sales were 2000 machines in 1981, and the industry is regarded as maturing. Finally, geothermal, OTEC, and fusion systems are reviewed. M.S.K.

A82-26407 The Nanticoke shoreline diffusion experiment, June 1978. IV. A - Oxidation of sulphur dioxide in a power plant plume. B - Ambient concentrations and transport of sulphur dioxide, particulate sulphate and nitrate, and ozone. K. G. Anlauf, P. Fellin, H. A. Wiebe (Department of the Environment, Atmospheric Environment Service, Downsview, Ontario, Canada), and O. T. Melo (Ontario Hydro, Research Div., Toronto, Canada). *Atmospheric Environment*, vol. 16, no. 3, 1982, p. 455-466. 29 refs.

A82-26409 Modeling continuous fumigation of Nanticoke generating station plume. P. K. Misra (Ontario Ministry of the

Environment, Air Resources Branch, Toronto, Canada) and S. Onlock (Monitec Limited Concord, Ontario, Canada). *Atmospheric Environment*, vol. 16, no. 3, 1982, p. 479-489. 13 refs.

A shoreline fumigation model is verified with the data from two studies conducted for the Ontario Hydro generating station plumes at Nanticoke. The model reproduces the physical system of continuous fumigation reasonably well. Predictions are shown to agree with observed values within the framework of the uncertainties in various input parameters. As expected, the parameters defining the state of the onshore air mass are critical in the estimate of ground level concentrations inside the fumigation zone. Also, sampling time plays an important role, even though data from the averaging of three to four helicopter passes conform to half hourly average concentration data and model predictions very well. (Author)

A82-26568 # Fuel optimal trajectory computation. J. W. Burrows (Boeing Computer Services Co., Energy Technology Applications Div., Seattle, WA). *Journal of Aircraft*, vol. 19, Apr. 1982, p. 324-329. 8 refs.

Roughly a quarter of the total fuel savings of the new generation of large jet transports will come from the capability of computing fuel optimal flight trajectories between departure point and destination. The shape of the trajectory in the vertical plane is treated here. A simplified mathematical model is described including spline fits to the drag and fuel flow functions. A suboptimal trajectory is found using the maximum principle of optimal control and singular perturbation theory. The inner or boundary-layer solutions are identified as the climb or descent segments of the flight, while the outer solution corresponds to cruise. The inner solutions are expanded to second order in the vicinity of the outer solution to develop cruise control laws for cost-effective response to altered in-flight conditions. (Author)

A82-27828 # Legal implications of economic activities in outer space. A. A. Cocca. In: Colloquium on the Law of Outer Space, 24th, Rome, Italy, September 6-12, 1981, Proceedings. New York, American Institute of Aeronautics and Astronautics, 1982, p. 19-23. (IAF 81-SL-50)

The directions of economically-driven activities in space are projected, along with legal guidelines -present or future- which will ensure maximum freedom for space development and restraint in areas of general concern. Policy objectives in economic matters of space exploitation are defined as space resources development for integration in the world economy, open cooperation between nations, a prevention of monopolies, and pricing which is equitable. Celestial body-based resources are noted to be open to exploitation although no claim can be made on undeveloped territories. The formation of space-oriented companies such as Intelsat, Intersputnik, the Space Committee, New World, Inc., Otrag, etc. are mentioned as positive manifestations of business activities operating without legal interference. Further review is given to insurance policies, formation of a Space Bank, and maintaining the Shuttle under NASA control. M.S.K.

A82-27851 # Ecospace. E. R. Finch, Jr. (Finch and Schaefler, Attorneys, New York, NY). In: Colloquium on the Law of Outer Space, 24th, Rome, Italy, September 6-12, 1981, Proceedings. New York, American Institute of Aeronautics and Astronautics, 1982, p. 189-193. (IAF 81-SL-40)

The paper defines Ecospace as the policy basis for 'international regimes' for global resources, including outer space. It discusses some 'Ecospace legal truths': (1) outer space requires long-range policy planning; (2) outer space is inherently international; (3) outer space provides solutions for the global resource shortage problems; (4) outer space is a factor for world peace, information and trade; and (5) participation by as many nations as possible in outer space is desirable. Various outer space treaties are marked as accomplishments. Solar power satellite plans are recommended noting Space Shuttle usages. Finally, four options are presented to the United States: (1) do it alone; (2) do nothing; (3) more R&D; and (4) cooperation with the Soviet Union. C.D.

A82-27853 # International legal basis and organizational framework for space activities - Present state, problems and prospects. V. Kopal (United Nations, Outer Space Affairs Div., New York, NY). In: Colloquium on the Law of Outer Space, 24th, Rome, Italy, September 6-12, 1981, Proceedings. New York, American Institute of Aeronautics and Astronautics, 1982, p. 201-205. 12 refs. (IAF 81-SL-51)

The present legal and organizational framework for international cooperation in space is reviewed with emphasis on the role of the United Nations and, in particular, of the UN Committee on the Peaceful Uses of Outer Space (COPUOS). The discussion covers principal legal instruments governing activities in space and international programs of space exploration and space applications promoted by the United Nations. Some current legal issues under consideration in the COPUOS are examined, including legal implications of remote sensing of the earth from space, the use of artificial satellites for direct television broadcasting, consideration of the possibility of supplementing the norms of international law relevant to the use of nuclear power sources in outer space, definition of outer space, and the legal status of the geostationary orbit. V.L.

A82-28000 Biomass energy systems and the environment. H. M. Braunstein, P. Kanciruk, R. D. Roop, F. E. Sharples, J. S. Tatum, and K. M. Oakes (Oak Ridge National Laboratory, Oak Ridge, TN). New York and Oxford, Pergamon Press, 1981. 190 p. 416 refs. $13.50.

The technology, resources, applied, and experimental features of biomass energy resources are explored, with an emphasis on environmental and social implications of large-scale biomass development. The existing land and water based biomass resource is described in terms of available energy, ecological concerns, agricultural crops, livestock production, freshwater systems, and ocean systems. Attention is given to proposed systems of biomass energy production from forestry and silviculture, agricultural crops, livestock wastes, and freshwater and ocean systems. A survey is made of various biomass materials, techniques for conversion to gas, liquid fuels, or for direct combustion, and impacts of large-scale biomass production and harvest are examined. Particular note is made of the effects of scaling biomass conversion systems, including near- and long-term applications, and ethics and aesthetic concerns. M.S.K.

A82-28523 The impact of mixing cooling tower and power plant plumes on sulfate aerosol formation. J. F. Meagher, E. M. Bailey (Tennessee Valley Authority, Muscle Shoals, AL), and M. Luria (Jerusalem, Hebrew University, Jerusalem, Israel). *Air Pollution Control Association, Journal*, vol. 32, Apr. 1982, p. 389-391. 8 refs. Research supported by the Tennessee Valley Authority; U.S. Environmental Protection Agency Contract No. EPA-IAG-D9-E721-DL.

Results of a study to determine the effect of power plant-cooling tower interaction on sulfate production from a coal-burning power plant are described. The plant investigated had one 244 m and two 183 m stacks, each connected to an electrostatic precipitator. Intermixing of the plumes in the afternoon hours resulted in increased SO2 oxidation. The excess SO4(-2) production is concluded to occur in a water droplet or on the wet surface of a particle, with metal ions such as Fe(+3) and Mn(+2) also playing an as yet undetermined role. The formation enhancement lasts only as long as wetted surfaces and/or increased reactant concentrations are present. M.S.K.

NASA RESEARCH ACTIVITIES IN AEROPROPULSION
John F. McCarthy, Jr. and Richard J. Weber 1982 30 p refs
Presented at the 24th Ann. Conf. on Aviation and Astronautics, Tel Aviv, Israel, 17-18 Feb. 1982
(NASA-TM-82788; E-1113) Avail: NTIS HC A03/MF A01 CSCL 21E

NASA is responsible for advancing technologies related to air transportation. A sampling of the work at NASA's Lewis Research Center aimed at improved aircraft propulsion systems is described. Particularly stressed are efforts related to reduced noise and fuel consumption of subsonic transports. Generic work in specific disciplines are reviewed including computational analysis, materials, structures, controls, diagnostics, alternative fuels, and high-speed propellers. Prospects for variable cycle engines are also discussed.

ENERGY CONSUMPTION FOR THE ECHO STATION (DSS 12)
C. N. Guiar and D. Schonfeld *In its* The Telecommun. and Data Acquisition Rept. 15 Dec. 1981 p 355-363 refs

Avail: NTIS HC A16/MF A01 CSCL 10B

Energy consumption for the Echo Station is analyzed. The HVAC equipment including vapor compression refrigeration units, absorption chillers, annd heating units such as boilers and heat pumps is shown to be the largest consumer of electrical energy. The energy consumption for the buildings at the station is itemized and compared to the electrical meter data. The figures for energy consumption as predicted by the ECP computer program are found to agree well with the meter data.

ENVIRONMENTAL ASSESSMENT OF THE USE OF ALCOHOL FUELS IN HIGHWAY VEHICLES
O. M. Bevilacqua, M. J. Bernard, III, D. Sperling, S. Rosenberg, L. J. Hill, D. Fingleton (WAPORA, Inc., Chicago), P. DEliscu (Santa Clara Univ.), and J. R. Gasper Dec. 1980 307 p refs
Prepared jointly with Argonne National Lab.
(Contract W-7405-eng-38)
(DE82-000887; ANL/CNSV-14) Avail: NTIS HC A14/MF A01

Impact associated with alcohol fuel storage, distribution, and use are assessed under four possible scenarios of alcohol fuel use during the period 1980 to 2000. Alcohol use is projected to range from 196 million bbl/yr by 2000, up from 5 million barrels in 1980. In addition to effects on the physical environment (aquatic and terrestrial ecosystems, air quality, and energy resources), consideration is given to the impacts of alcohol fuel use on such social and economic concerns as health and safety, employment, retail fuel costs, balance of trade, capital investments, and regulatory needs. Although some potentially negative impacts are identified, in general, the assessment finds that the use of alcohol fuels would have a positive or neutral effect on the environment; moreover, the negative impacts could be mitigated through the judicious application of existing regulatory controls and procedural standards.

ASSESSMENT OF THE ECONOMIC, TECHNICAL, AND ENVIRONMENTAL FEASIBILITY OF DEVELOPING, CONSTRUCTING, AND OPERATING A 25-MILLION-GALLON-PER-YEAR GRAIN-ETHANOL-PRODUCTION FACILITY. VOLUME 1: EXECUTIVE SUMMARY
May 1981 47 p 4 Vol.
(Contract DE-FG07-80RA-50365)
(DE82-000294; DOE/RA-50365/T1-Vol-1) Avail: NTIS HC A03/MF A01

The economic, technical, and environmental feasibility of developing, constructing, and operating a 25 million gallon per year ethanol facility in northeastern Oklahoma was determined. The executive summary is presented. A site providing the necessary grain, energy, and labor resources; flexible transportation methods and alternatives for receiving and shipping; nearby markets for products and by-products; an existing environmental quality able to withstand the minor impacts of the process; and a receptive and growing business and community environment was selected. The ability to produce a high quality product at a reasonable and competitive price with or without federal assistance or state assistance in the form of tax exemptions is demonstrated. It is shown that coal burning technologies are efficient, whether conventional burning methods or innovative methods such as fluidized-bed combustion are used. All resources for the process are available nearby. The grains required come from carryover reserves, thus not impacting the food supply. The residual by-products are in high demand.

CARBON DIOXIDE POWER PLANT FOR TOTAL EMISSION CONTROL AND ENHANCED OIL RECOVERY
Frederick L. Horn and Meyer Steinberg Aug. 1981 28 p refs
(Contract DE-AC02-76CH-00016)

(DE81-030734; BNL-30046) Avail: NTIS HC A03/MF A01

The design of a compact environmentally acceptable carbon dioxide diluted coal-oxygen fired power plant is described. The plant releases no combustion products to the atmosphere. The oxygen for combustion is separated in an air liquefaction plant and the effluent nitrogen is available for use in oil well production. Recycle carbon dioxide mixed with oxygen replaces the nitrogen for the combustion of coal in the burners. The carbon dioxide produced is used in enhanced oil recovery operations and injected into spent wells and excavated salt cavities for long-term storage. The recovery of CO2 from a coal-burning power plant by this method appears to have the lowest energy expenditure and the lowest by-product cost compared to alternative removal and recovery processes. INTERNATIONAL MARKET ASSESSMENT OF STAND-ALONE PHOTOVOLTAIC POWER SYSTEMS FOR COTTAGE INDUSTRY APPLICATIONS Final Report

Therese M. Philippi Nov. 1981 290 p refs

(Contracts DEN3-197; DE-AI01-79ET-20485)

(NASA-CR-165287; DOE/NASA/0197-1; IITRI-J06519) Avail: NTIS HC A13/MF A01 CSCL 10B

The final result of an international assessment of the market for stand-alone photovoltaic systems in cottage industry applications is reported. Nonindustrialized countries without centrally planned economies were considered. Cottage industries were defined as small rural manufacturers, employing less than 50 people, producing consumer and simple products. The data to support this analysis were obtained from secondary and expert sources in the U.S. and in-country field investigations of the Philippines and Mexico. The near-term market for photovoltaics for rural cottage industry applications appears to be limited to demonstration projects and pilot programs, based on an in-depth study of the nature of cottage industry, its role in the rural economy, the electric energy requirements of cottage industry, and a financial analysis of stand-alone photovoltaic systems as compared to their most viable competitor, diesel driven generators. Photovoltaics are shown to be a better long-term option only for very low power requirements. Some of these uses would include clay mixers, grinders, centrifuges, lathes, power saws and lighting of a workshop. Author

WIND ENERGY PLANNING CONSIDERATIONS [WINDENERGIE IN PLANOGISCH PERSPEKTIEF]

A. vanSetten and H. Voogd Apr. 1980 19 p refs In DUTCH Presented at Planning Conf., Amsterdam, Apr. 1980

(PM-80-4) Avail: NTIS HC A02/MF A01

Windpowered utilization in the Netherlands and the search for wind rich areas is discussed. It is suggested that large water areas, like the North Sea and Market Lake, are the preferred areas for wind powered energy production. Storage of wind energy in large water basins is suggested. Government wind energy production programs like the installation of wind parks, and difficulties because of opposing local interests are discussed. Windmill exploration by small private industry, rather than by government administered programs, are outlined. E.A.K.

RISK OF PRODUCING ENERGY, AND CONSERVING IT

H. Inhaber, G. Caton, and R. Gove 1981 25 p refs Presented at 6th Intern. Symp. on the Uranium Inst., London, Sep. 1981

(Contract W-7405-eng-26)

(DE81-030807; CONF-810965-1) Avail: NTIS HC A02/MF A01

The idea that society can have a free lunch in the form of a risk-free energy system is rapidly fading away. All energy systems have some risk to human health, and for some it can be substantial. Nuclear power seems to have both a low occupational and public risk compared to other forms. In addition to this, research is presented with calculations on some of the risk associated with sealing up houses to keep heat in. When the effects of the accumulated radon are included; the risk per unit energy saved for this form of conservation can be great. Indeed, it appears to be much greater than the public risk of nuclear power. DOE

CHOICE AND UTILIZATION OF ENERGY-USING DURABLES

Electric Power Research Inst. Aug. 1981 349 p refs Workshop held in Boston, 1-2 Nov. 1979 Sponsored by Electric Power Research Inst.

(EPRI Proj. 1050)

(DE81-904228; EPRI-EA-1981; CONF-7911154) Avail: NTIS HC A15/MF A01

The adequacy of state of the art methods to analyze the choice and utilization of energy using durables by households is assessed. The long run adjustment process of households to higher energy prices is characterized in large part by their choice of type and efficiency of new energy using durables (e.g., major appliances and automobiles). Trade-offs must be made between original purchase price and future operating costs, the latter depending not only on prospective energy costs but on expected levels of utilization. Considerable progress has been made in modeling these important factors and their interactions. DOE

ANALYSIS TO DEVELOP A PROGRAM FOR ENERGY-INTEGRATED FARM SYSTEMS
D. E. Eakin, M. A. Clark, L. K. Inaba, and K. I. Johnson Sep. 1981 127 p refs
(Contract DE-AC06-76RL-01830)
(DE82-000318; PNL-3981) Avail: NTIS HC A07/MF A01

A program to use renewable energy resources and possibly develop decentralization of energy systems for agriculture is discussed. The program's objective is determined by: (1) an analysis of the technologies that could be utilized to transform renewable farm resources to energy by the year 2000, (2) the quantity of renewable farm resources that are available, and (3) current energy-use patterns. Individual research, development, and demonstration projects are fit into a national program of energy-integrated farm systems on the basis of market need, conversion potential, technological opportunities, and acceptability. Quantification of these factors for the purpose of establishing program guidelines is conducted using the following four precepts: (1) market need is identified by current use of energy for agricultural production; (2) conversion potential is determined by the availability of renewable resources; and (3) technological opportunities are determined by the state-of-the-art methods, techniques, and processes that can convert renewable resources into farm energy. DOE

ASSESSMENT OF SEASONAL-EFFICIENCY MODELS FOR NATURAL-GAS FIRED RESIDENTIAL FURNACES
N. Domingo and E. G. Keshock Sep. 1981 81 p refs
(DE82-000499; ORNL-5801) Avail: NTIS HC A05/MF A01

Several methods for determining the seasonal efficiency and operating costs of residential fossil-fuel-fired heating systems are discussed. Four computer models for determining such efficiency, the Honeywell HFLAME model, the National Bureau of Standards DEPAF model, the Institute of Gas Technology SPACE-FI model, and the Carrier Corporation model, are separately described, discussed, and evaluated in relation to their use in predicting seasonal performance of residential gas-fired heating systems. A general conclusion is that purely analytical estimations of seasonal furnace efficiencies are not generally reliable principally because of: (1) a variety of furnace designs; and (2) the different infiltration characteristics of homes. DOE

FLUE-GAS DESULFURIZATION: REVIEW OF SELECTED COMMERCIAL AND ADVANCED TECHNOLOGIES
Jerry L. Gillette and Shen-Yann Chiu Feb. 1981 187 p refs
(Contract W-31-109-eng-38)
(DE82-001960; ANL/FE-81-51) Avail: NTIS HC A09/MF A01

Selected technologies for the desulfurization of flue gas are reviewed and evaluated. One of the technologies, wet scrubbing of the gas with a slurry containing either lime or limestone, has attained widespread commercial usage and for this reason is presented as the base case against which 10 second-generation systems of flue-gas desulfurization (FGD) are compared. The new technology include chemical-treatment, or scrubbing, processes and processes that combine scrubbing and filtering of the flue gas. The two combination processes use baghouse filters, with the SO2-collecting material either injected dry or sprayed into the system. The eight straight-scrubbing processes use either wet or dry collecting materials and are identified as follows: aqueous-carbonate, copper-oxide, Bergbau-Forschung, sodium-sulfite-based double-alkali, DOA double-alkali, Chiyoda-121, magnesia, and Wellman-Lord. HC A03/MF A01

The Department of Energy has established the Advanced Environmental Control Technology Program to protect the environment while supporting the development of more efficient and acceptable technologies utilizing domestic fossil fuels. This program consolidates cleanup efforts in ongoing technology specific DOE programs (such as combustion and gasification, and cleanup projects transferred from EPA to DOE) with new project initiates into a coordinated program that addresses cleanup technology development. There are numerous problems associated with using coal to replace oil and gas as a primary fuel. Sulfur, nitrogen, alkali and halogen compounds, and mineral particulate matter, all found in varying proportions in the domestic coals, are released during gasification and combustion. These contaminants of coal, as well as the soot and tars produced by incomplete combustion or gasification, can potentially degrade the performance of the energy producing system. DOE

ASSESSMENT OF ENVIRONMENTAL HEALTH AND SAFETY ISSUES ASSOCIATED WITH THE COMMERCIALIZATION OF UNCONVENTIONAL GAS RECOVERY: DEVONIAN SHALE
Sep. 1981 88 p refs
(Contract DE-AC06-76RL-01830)
(DE82-001047; PNL-3848) Avail: NTIS HC A05/MF A01

Potential public health and safety issues and the potential environmental impacts from recovery of natural gas from Devonian age shale are identified. The resource and the DOE eastern gas shales project are described. The new and developing recovery technologies associated with Devonian shale are described. An assessment of the environment, health and safety impacts associated with a typical field is presented. The typical field for this assessment occupies ten square miles and is developed on a 40-acre spacing (that is, there is a well in each 40-acre grid). This field thus has a total of 160 wells. Finally, conclusions and recommendations are presented. A reference list is provided to give a greater plant. Based on the estimated plant cost and the various cases of operating income, an economic analysis was performed employing a profitability index criterion of discounted cash flow to determine an interest rate of return on the plant investment. PUBLIC HEALTH HAZARDS OF LURGI/FISCHER TROPSCH COAL LIQUEFACTION
J. R. Gasper and S. E. Rosenberg Jan. 1981 63 p refs
(Contract W-31-109-eng-38)
(DE82-001617; ANL-EES-TM-153) Avail: NTIS
HC A04/MF A01

The public hazards of wastes from Lurgi/Fischer-Tropsch coal liquefaction were identified. Data on dose response and synergism are not available for many of the waste chemicals from this process. This approach employs two measures of hazards: (1) body burdens that result from exposure to Lurgi/Fischer-Tropsch wastes are compared to body burdens from other sources of the same chemicals; (2) ambient concentrations of pollutants from Lurgi/Fischer-Tropsch operations are projected and compared to various air and water quality standards. DOE

SULFUR GAS EMISSIONS FROM STORED FLUE GAS DESULFURIZATION SOLIDS Final Report
D. F. Adams Oct. 1981 87 p refs Sponsored by Electric Power Research Inst.
(EPRI Proj. 856-2)
(DE82-900859; EPRI-EA-2067) Avail: NTIS
HC A05/MF A01

The emissions of volatile, sulfur-containing compounds from the surfaces of 13 flue gas desulfurization (FGD) solids field storage sites were characterized. The sulfur gas emissions from these storage surfaces were determined by measuring the sulfur gas enhancement of sulfur-free sweep air passing through a dynamic emission flux chamber placed over selected sampling areas. Samples of the enclosure sweep air were cryogenically concentrated in surface-deactivated Pyrex U traps. Analyses were conducted by wall-coated, open-tubular, capillary column, cryogenic, temperature-programmed gas chromatography using a sulfur-selective flame photometric detector. Several major variables associated with FGD sludge production processes were examined in relation to the measured range and variations in sulfur fluxes including: the sulfur dioxide scrubbing reagent used, sludge sulfite oxidation, unfixed or stabilized (fixed) RGD solids, and ponding or landfill storage. The composition and concentration of the measured sulfur gas emissions were found to vary with the type of solids, the effectiveness of rainwater drainage from the landfill surface, the method of impoundment, and the sulfate/sulfite ratio of the solids. EXHAUST EMISSIONS FROM HIGH-MILEAGE CATALYST-EQUIPPED PASSENGER CARS
Gary T. Jones Jul. 1981 15 p refs
(PB82-103326; EPA-AA-TEB-81-20) Avail: NTIS
HC A02/MF A01 CSCL 13B

Vehicles from the 1975 through 1981 model years were used to examine the effect of 'high mileage' on levels of exhaust emissions. The emission levels from the vehicles involved were examined from four basic views: (1) 'as received' results of the top 15% (by odometer) versus similar results from the bottom 15% and 85%; (2) 'as received' results of vehicles with over 50,000 miles versus those with under 50,000; (3) the effects of restorative maintenance on high mileage vehicles; and (4) the effects of catalyst replacement on high mileage vehicles. The results show that the high mileage vehicles exhibit higher average HC and CO emissions than the lower mileage vehicles. It was also found that on the averge, catalytic converters remain active beyond a vehicle's statutory 'useful life' of 50,000 miles and that restorative maintenance is an effective method to reduce average emission levels. FUEL ECONOMY AND EXHAUST EMISSIONS OF A METHANOL-FUEL CHEVETTE
H. Anthony Ashby May 1981 7 p refs
(PB82-101783; EPA-AA-TEB-81-23) Avail: NTIS
HC A02/MF A01 CSCL 13F

The results of a series of tests conducted over a period of several months on a 1979 Chevrolet Chevette powered by anhydrous methanol are presented. Baseline tests with gasoline were also conducted about three months before the methanol test series began. The exhaust emissions from this car were greatly affected by air-fuel ratio and state of tune. Driveability was not good during most tests when CO met Federal standards. The best optimized adjustments gave a 10 percent better energy efficiency on pure methanol than on gasoline with approximately similar exhaust emission levels. GRA

WASTEWATER TREATMENT FACILITIES, TWINING WATER AND SANITATION DISTRICT, TAOS COUNTY, NEW MEXICO Draft Environmental Impact Statement
Aug. 1981 284 p refs
(PB82-104670; EPA-906/9-81-002) Avail: NTIS
HC A13/MF A01 CSCL 13B

The Twining Water and Sanitation District has considered alternatives for wastewater management which would solve a pollution problem in the high-quality Rio Hondo watershed of northern New Mexico. The district proposes construction of a new advanced treatment plant with a capacity of 95,000 gallons per day. A major alternative is to rehabilitate the existing plant

and provide only the capacity needed to treat existing wastewater flows (83,000 gallons per day). EPA is considering approval and funding of either alternative (as well as providing no funding). Many complex issues bear on EPA's decision, including impacts on water quality, water supply, and socio-economic conditions.

OIL SLICK DISPERSAL MECHANICS Final Report
Chukwuka A. Osamor and Robert C. Ahlert Sep. 1981 238 p refs
(Grant EPA-R-805901)
(PB82-105560; EPA-600/2-81-199) Avail: NTIS HC A11/MF A01 CSCL 13B

The spreading and dissolution behavior of small oil slicks formed from spills of 12 oils was investigated. The increases in area covered by the oils during spreading experiments were determined using photographic techniques. The rate of dissolution of the oils in tap water at 25 C were investigated by equilibrating oils with water in open static tests. Limits of solubilities were established for the oils from equilibration in closed vessels. Six oils were also equilibrated with salt water. A segmented mathematical model were derived and used to correlate experimental data. The primary mechanisms are quantified by analogy to homogeneous and heterogeneous catalysis and detergency. Parameters investigated include oil and dispersant types, oil to dispersant ratios, degree of agitation, and the effect of salt water.

HYDROGEN SULFIDE GENERATION BY REACTION OF NATURAL GAS, SULFUR AND STEAM Report of Investigations, Jul. 1981
S. R. Crane, Laird Crocker, and W. I. Nissen Jul. 1981 61 p refs
(PB82-106998; BM-RI-8539) Avail: NTIS HC A04/MF A01 CSCL 13B

A regenerable flue gas desulfurization process was developed. The citrate process uses a buffered weak acid solution to absorb SO2 from the waste gas. The absorbed SO2 is reacted with H2S to precipitate elemental sulfur and regenerate the solution for recycle. The H2S feedstock xor the process may be produced by reacting two-thirds of the recovered elemental sulfur with natural gas and steam. Laboratory investigations and pilot plant operations were conducted by the Bureau to determine if H2S from the natural gas, sulfur, and steam reaction was suitable for the citrate process. The laboratory investigations, in which an H2S generator was integrated with other citrate process operations, provided a basis for design and operation of the pilot plant. The objective was to provide H2S for citrate process pilot plant.

ENVIRONMENTAL ASSESSMENT, SOURCE TEST AND EVALUATION REPORT: COAL PREPARATION PLANT NO. 2 Final Report, Sep. 1979 - Mar. 1981
J. Buroff, J. Strauss, A. Jung, and L. McGilvray Apr. 1981 304 p refs
(Contract EPA-68-02-3136)
(PB82-103573; EPA-600/7-81-071B) Avail: NTIS HC A14/MF A01 CSCL 06F

Results and conclusions are given of a source test and evaluation program at a coal preparation plant, representing cleaning plants that process run of mine coal with high pyritic sulfur content, use high technology coal cleaning processes, operate in a high rainfall environment, and have a low soil neutralization potential. The major objective of the program was to perform an environmental assessment on the plant's waste streams and fugitive emissions. Chemical analysis results indicated that all streams, except fugitive particulates, contained constituents which may have a potentially harmful health and/or ecological effect. For streams showing potential for ecological affects, Mn was of concern for streams showing a potentially harmful health effect. Mn and Or were of prime concern. Contrary to previous studies, high Ni-13 concentrations were observed in the leachate. Further investigation of the Ni-13 source is warranted. Bioassays for fugitive particulates, sedimentation pond waters, and fine refuse slurry solid samples indicated moderate biological effects.

QUSER USER'S GUIDE
Mark D. Buck Sep. 1981 77 p refs
(Contract DE-AC01-80EI-11975)
(DE81-030681; DOE/EIA-11975/T1) Avail: NTIS HC A05/MF A01

The QUSER program functions as the controlling routine of the Midterm Energy Market Model (MEMM). In MEMM, a linear program (LP) is solved iteratively until QUSER determines that all convergence criteria have been met. After each iteration, QUSER is called to calculate new input prices and demands for the next iteration of the LP. The LP solution is considered to be a converged solution when the prices and demands input to the last iteration and the prices and demands from the LP solution differ by less than two percent. QUSER's other main function is to model energy pricing regulations for natural gas and electricity. These policies are based on average prices while the LP solution gives marginal prices. The program uses FORTRAN language.

ANALYSIS OF FEDERAL INCENTIVES USED TO STIMULATE ENERGY CONSUMPTION
R. J. Cole, B. W. Cone, J. C. Emery, M. Huelshoff, D. E. Lanerz, A. Marcus, F. A. Morris, W. J. Sheppard, and P. Sommers Aug. 1981 268 p refs
(Contract DE-AC06-76RL-01830)
(DE81-031928; PNL-3558) Avail: NTIS HC A12/MF A01

Federal incentives that have increased the consumption of coal, oil, natural gas and electricity are identified. The stimulus comes through changing values of variables included in energy demand functions, thereby inducing energy consumers to move along the function in the direction of greater quantity of energy demanded, or through inducing a shift of the function to a position where more energy will be demanded at a given price. The demand variables fall into one of six categories: price of the energy form, price of complements, price of substitutes, preferences, income, and technology. The government can provide such incentives using six different policy instruments: taxation, disbursements, requirements, nontraditional services, traditional services, and market activity. The four major energy forms were examined. Six energy consuming sectors were examined:

residential, commercial, industrial, agricultural, transportation, and public. DOE

ELECTRIC CAR: IS IT STILL THE VEHICLE OF THE FUTURE
R. L. Graves, C. D. West, and E. C. Fox Aug. 1981 29 p refs
(Contract W-7405-eng-26)
(DE81-030437; ORNL/TM-7904) Avail: NTIS
HC A03/MF A01

An analysis of electric and internal combustion engine (ICE) cars of equivalent performance shows that, even with advanced batteries, the electric vehicle would be much more costly to run (23 cents/mile vs 16 cents/mile) than the ICE car. The electric vehicle, of course, would not use gasoline, thus reducing the nation's dependence on imported oil; however, the cost of oil saved in this way would be about $190/bbl, and the same result could be achieved at about one quarter the cost by manufacturing synfuels from domestic coal or oil shale. A similar analysis of some proposed hybrid electric vehicles indicates that they are also more costly to operate than an equivalent conventional vehicle, although by a smaller margin. The cost of oil saved by the use of hybrid vehicles is also lower, although it is still much more than the projected cost of synthetic fuels. The key to improving the economics of the electric vehicle is to increase battery life or lower battery costs. DOE

DOE-2 VERIFICATION PROJECT, PHASE 1 Interim Report
Stephen C. Diamond, Bruce D. Hunn, and Charlene C. Cappiello. Apr. 1981. 74 p. refs
(Contract W-7405-eng-36)
(LA-8295-MS) Avail: NTIS HC A04/MF A01

Phase 1, an analytical and empirical verification of DOE-2 as computational algorithms, is reported. DOE-2 is a computer program developed to provide architect/engineers with a public domain tool for energy analysis buildings. Results of a comparison of plant equipment performance default values with manufacturer's data, and results of a series of comparisons of DOE-2 solar simulator predictions with predictions of other solar system simulation computer programs. Results of empirical tests of the full DOE-2 program are also presented, including comparisons with measured monthly and annual energy consumption for seven commercial buildings located in seven different cities and for nine elementary schools. Comparisons of predicted results of several building energy analysis computer programs are reported. E.A.K.

ASSESSMENT OF TECHNICAL POTENTIAL: PROBLEMS, METHODS AND RESULTS
G. Obemair *In* Kernsforschungsanlage Implementing Agreement for a Program of Res. and Develop. on Wind Energy Conversion Systems Apr. 1981 p 17-28 (For primary document see N82-17617 08-44)
Avail: NTIS HC A06/MF A01

The technical and economic problems posed by the integration of wind energy into the electric power supply system are considered. Stability and control requirements, the efficiency of wind converters and the exclusion of technically inaccessable areas are applied to the stochastic wind field over the total area. The resulting technical potential is then reduced to an economic potential by applying an economic filter which involves competitiveness measured against other energy sources, comparative social costs and socio-economic preferences, and the actual cost and existing use of land for wind energy parks. J.D.H.

CUSTOMER ATTITUDES TOWARD THERMAL-ENERGY-STORAGE HEATING
H. N. Hersh. Jun. 1981. 74 p. refs
(Contract W-31-109-eng-38)
(DE82-003010; ANL-SPG-17) Avail: NTIS HC A04/MF A01

Attitudes among users of thermal energy storage (TES) heating systems were studied. A customer acceptance survey exploring attitudes and levels of satisfaction, face to face contacts between utility representatives and users, and a survey of pertinent published information are investigated. It is found that: (1) TES heating systems are installed for economic reasons by customers who can afford higher initial costs and understand the concept of lower total cost; and (2) attitudes toward TES are positive. The TES systems are not regarded more favorably than conventional systems, however, and it is likely that lower electric heating bills are responsible for the favorable perceptions of most TES users. (NASA-CR-168458) Avail: NTIS HC A06/MF A01 CSCL 13B

The international demand for and supply of oil between the years 1980 and 2000 is assessed and future world oil prices and their implications for the price of jet fuel are estimated. Three critical questions are investigated: (1) how long will the world supply of oil continue to keep pace with its demand under likely trends in its use and discovery; (2) at what price will demand and supply clear the world oil market; (3) what does the analysis imply about the price of jet fuel. Projection of oil price is based upon supply and demand, which is consistent with microeconomic analysis. E.A.K.

ASSESSMENT OF OIL PRODUCTION VOLATILE ORGANIC COMPOUND SOURCES Final Report, Jan. - Sep. 1980
W. S. Eaton, G. R. Schneider, W. Unterberg, and F. G. Bush, III. Sep. 1981. 75 p
(Contract EPA-68-03-2648)
(PB82-108176; EPA-600/2-81-197) Avail: NTIS HC A04/MF A01 CSCL 13B

Oil and gas exploration and production drilling technology are described with emphasis on the makeup, use, and disposal of drilling fluids. A model for assessment of volatile organic compounds (VOC) emissions accompanying drilling is presented, along with an estimation of the potential VOC emissions associated with drilling activities. Emissions of volatile organic compounds from oil production in new fields were estimated, based on three types of information: (1) extent of new oil and gas fields (those that started production after 1974) in the contiguous 48 states; (2) drilling techniques used for oil and gas exploration and production wells (and their VOC potential), with specific emphasis on the drilling fluids; and (3) equipment and techniques for oil and gas production in new fields and their potential VOC sources. PERFORMANCE EVALUATION OF AN INDUSTRIAL SPRAY DRYER FOR SO2 CONTROL Final Report, Mar. 1980 - Jun. 1981
James A. Kezerle, Steve W. Mulligan, Dave-Paul Dayton, and Patricia J. Perry. Aug. 1981. 274 p. refs. Prepared in cooperation with Celanese Fibers Company, Cumberland, Md. and Rockwell International, Downey, Calif., and Wheelabrator-Frye, Inc., Pittsburgh, Pa.
(Contract EPA-68-02-3174)
(PB82-110701; EPA-600/7-81-143) Avail: NTIS HC A12/MF A01 CSCL 13B

Results of a test to evaluate the SO2 removal performance of the lime-spray-dryer/fabric-filter system treating flue gas from the stoker-coal-fired boiler are presented. Continuous monitors were used to collect data according to EPA procedures for compliance testing. Data were collected for 23 days with the boiler operating at about half load. In addition to evaluating SO2 removal by dry flue gas desulfurization, operating experience with the boiler and spray-dryer/baghouse system was obtained for 5 months. Data were reduced to express SO2 removal on a mass per unit energy input basis as prescribed by EPA. Test

results showed the mean SO2 removal efficiency to be 70% (standard deviation of + or - 9%) when the sulfur content of the bituminous coal averaged 2%. T.M.

PILOT FIELD STUDIES OF FGD WASTE DISPOSAL AT LOUISVILLE GAS AND ELECTRIC Final Report, May 1976 - Aug. 1979
R. P. VanNess, A. L. Plumley (Combustion Engineering, Inc., Windsor, Conn.), N. C. Mohn (Combustion Engineering, Inc., Windsor, Conn.), C. R. Ulrich (Louisville Univ., Kentucky), and D. J. Hagarty (Louisville Univ., Kentucky) 1981 314 p refs
(Contract EPA-68-02-2143)
(PB82-105479; EPA-600/7-81-155) Avail: NTIS HC A14/MF A01 CSCL 13B

The gas desulfurization (FGD) waste disposal was studied. It is shown that properly prepared landfill from FGD sludge/fly ash mixtures prevents trace element contamination of underlying groundwater. Small synthetically lined, above ground impoundments has higher concentrations of trace contaminants than subsurface impoundments. Most sites developed compressive strengths greater than the minimum required for recreational or light structural landfill. Water samples from beneath larger subsurface impoundments indicated that the filtering action of soil aids in decreasing the concentration of contaminants reaching the ground water supply. Certain mixtures under fixation reaction, reducing the permeability and minimizing the release of moisture and/or contaminants to the surrounding soil. GRA

DEFINITIVE SOx CONTROL PROCESS EVALUATIONS: AQUEOUS CARBONATE AND WELLMAN-LORD (ACID, ALLIED CHEMICAL, AND RESOX) FGD (FLUE GAS DESULFURIZATION) TECHNOLOGIES Final Report, Apr. 1978 - Apr. 1981
J. R. Byrd, K. D. Anderson, S. V. Tomlinson, and R. L. Torstrick Jun. 1981 319 p refs
(Contract EPA-IAG-D9-3721-B1)
(PB82-118670; EPA-600/7-81-099; EDT-121) Avail: NTIS HC A14/MF A01 CSCL 13B

Economic evaluations of two processes: (1) the aqueous carbonate process (ACP) and the Wellman-Lord process, applied to a sulfuric acid plant, (2) the Resox process, and the coal reduction process, all for sulfur production are reported. The ACP uses a spray dryer flue gas desulfurization (FGD) system and molten salt reduction with coal to make sulfur. The ACP has a major cost advantage because it incorporates final fly ash and chloride removal as process functions. The ACP has a major advantage in annual revenue requirements because it does not need process or reheat steam. Wellman-Lord process costs are the same for all three applications. GRA

CLIMATIC INFLUENCES OF RESIDENTIAL ENERGY CONSUMPTION Ph.D. Thesis
Stewart Jay Cohen 1981 193 p
Avail: Univ. Microfilms Order No. 8127570

A climatic index, applicable to the estimation of residential energy consumption was developed. The index is based on seasonal frequencies of upper-air (500-mb height) circulation patterns. A multivariate statical technique, principal component analysis with oblique rotation of eigenvectors was used to classify 33 years of daily 500-mb height anomaly, patterns into 30 components. Each component represents two modes, positive and inverse, thereby resulting in sixty 500-mb types. Additional aggregation procedures reduced the number of types to 48. 78% of all days were categorized by this method. Two sets of regression analyses were performed on the data base, on set using 500-mb type frequencies, the other using population weighted heating degree days (POPHDD) and unweighted heating degree days (HDD). Results show that the 500-mb type frequency is a better climatic index of long term residential natural gas consumption than either HDD or POPHDD. Dissert. Abstr.

INCREASE OF ATMOSPHERIC CO2 AND POSSIBLE CLIMATIC CHANGES
Bert Bolin *In* WMO Tech. Conf. on Climate: Asia and Western Pacific 1981 p 227-238 refs

Avail: NTIS MF A01; print copy available at WMO, Geneva SwFr 28

Numerous surveys of man's impact on climate, particularly the possible effects of an increasing concentration of atmospheric CO2 were made. A brief account summarizing the state of knowledge in this regard is made. Consideration is given to: (1) the characteristics of the carbon cycle and its response to man-made emissions to the atmosphere; (2) the climatic change that may be induced by an increasing amount of CO2 in the atmosphere; and (3) the likely developments over the next 50 years as a result of man's increasing exploitation of the global resources of fossil fuels and the terrestrial ecosystems. Analysis of the way in which the carbon cycle responds to disturbances due to man, i.e., fossil fuel combustion, deforestation and expansion of agriculture is considered to be of particular importance. ENERGY AND CLIMATE IN SOUTH-EAST ASIA AND THE WESTERN PACIFIC
G. J. Lockwood *In* WMO Tech. Conf. on Climate: Asia and Western Pacific 1981 p 239-263 refs

Avail: NTIS MF A01; print copy available at WMO, Geneva SwFr 28

Regional and global aspects of energy use were reviewed. The combined results of population increases, changing patterns of population densities, and escalating per capita energy consumption has concentrated in some regions of the world very large energy fluxes per unit area (energy flux density) when compared with the world average; consequences are considered. Climate is discussed as related to increasing energy use in three major areas: (1) climate as an energy source; (2) pollution of the atmosphere by energy use (waste heat and aerosols); and (3) climatic controls on energy use and the effects of climatic variations. Long term climatic changes and the attendant economic consequences of increased atmospheric carbon dioxide are discussed. Utilization of wind, water, and solar power as climate related energy sources is also considered. M.D.K.

VEHICLE TEST REPORT: ELECTRIC VEHICLE ASSOCIATES ELECTRIC CONVERSION OF AN AMC PACER
Theodore W. Price, Vincent A. Wirth, Jr., and Michael F. Pompa 15 Oct. 1981 61 p refs
(Contracts NAS7-100; DE-AI01-78CS-54209)
(NASA-CR-168425; JPL-Pub-81-97; DOE/CS-54209/4) Avail: NTIS HC A04/ A01 CSCL 13F

Tests were performed to characterize certain parameters of the EVA Pacer and to provide baseline data that can be used for the comparison of improved batteries that may be incorporated into the vehicle at a later time. The vehicle tests were concentrated on the electrical drive subsystem; i.e., the batteries, controller and motor. The tests included coastdowns to characterize the road load, and range evaluations for both cyclic and constant speed conditions. A qualitative evaluation of the vehicle's performance was made by comparing its constant speed range performance with other electric and hybrid vehicles. The Pacer performance was approximately equal to the majority of those vehicles assessed in 1977. A.R.H.

FUEL ECONOMY AND EXHAUST EMISSIONS CHARACTERISTICS OF DIESEL VEHICLES: TEST RESULTS OF A PROTOTYPE FIAT 131TC 2.4 LITER AUTOMOBILE
S. S. Quayle Jan. 1982 58 p refs
(NASA Order C-32817-D; Contract DE-AI01-80CS-50194)
(NASA-CR-165535; DOE/NASA/2817-2; DOT-TSC-NASA-81-2) Avail: NTIS HC A04/MF A01 CSCL 13F

The results obtained from fuel economy and emission tests conducted on a prototype Fiat 131 turbocharged diesel vehicle are presented. The vehicle was tested on a chassis dynamometer over selected drive cycles and steady-state conditions. Two fuels were used, a United States number 2 diesel and a European diesel fuel. Particulate emission rates were calculated from dilution tunnel measurements and large volume particulate samples were collected for biological and chemical analysis. It was determined that turbocharging accompanied by complementary modifications results in small but substantial improvements in regulated emissions, fuel economy, and performance. Notably, particulate levels were reduced by 30 percent. Author

COMMUNICATION AND INTEGRATION WITHIN THE AGRICULTURE WATER, WASTE, AND ENERGY INDUSTRIES
D. C. Andrews Sep. 1980 28 p refs
(ERG-033) Avail: NTIS HC A03/MF A01

The special area of interest lies in the possible benefits of integrating and coordinating the activities of the agriculture, water, waste and energy (AWWE) sectors, where large cash and energy savings seem possible. The integration of the AWWE sectors is a specific example, but the comments and methods suggested are general in their application to complex problem-solving areas. A general method is described which, compared with conventional research, makes the collection of information on potential integration and coordination of any complex activities much easier. It also makes it more likely that the information is relevant and correct but, above all, the method ensures that any useful results of the research will be brought to the attention of relevant policy makers, with therefore a better chance that such results will be acted upon. Lateral access networks are proposed as a general means of achieving these practical benefits. J.M.S.

ELECTRIC VEHICLE REFUELLING INFRASTRUCTURE
Mike Baker Oct. 1981 69 p refs
(ERG-038) Avail: NTIS HC A04/MF A01; Secy. Energy Research Group, Milton Keynes, England

Energy and economic aspects of refueling infrastructures required in 2025 by complete fleets of electric battery and coal derived liquid fuel powered road vehicles are compared. Data are drawn from a study of the United Kingdom. The electric car is cheaper than the liquid powered one. If battery exchange is discounted, all electric vehicles have lower fuel costs than their equivalent. The electric vehicle alternative shows a very large saving in both primary energy and running cost. It requires a much smaller installed electricity generating capacity whose load factor is such that it can be totally nuclear. Author (ESA)

A METHOD FOR ESTIMATING FUEL CONSUMPTION AND VEHICLE EMISSIONS ON URBAN ARTERIALS AND NETWORKS
Juri Raus Apr. 1981 60 p refs
(PB82-108523; FHWA/TS-81/210) Avail: NTIS HC A04/MF A01 CSCL 13F

A method to estimate motor vehicle fuel consumption and vehicle emissions in an urban driving environment which requires a minimum of field data collection and processing effort was developed. Average transient speed measured by travel time is a good composite parameter reflecting stops and slowdowns and is closely correlated with fuel consumption and vehicle emission rates. Data were obtained for fuel speed and emission speed profiles for a 1980 typical mix of passenger cars, single unit trucks, tractor trailers and busses. Data and computational procedure provide an approach for estimating fuel consumption and emissions and can be used to gain insight into existing traffic operations and the merits of proposed or actual flow improvements. [AVIATION AND SPACE FLIGHT RESEARCH ACTIVITIES] Annual Report, 1980 [JAHRESBERICHT 1980]
Sep. 1981 176 p refs In GERMAN
Avail: NTIS HC A09/MF A01

Results on the main research projects conducted in 1980 are described in the areas of transport and communication systems, airplanes, space flight techniques, exploration techniques, and energy and turbomachinery techniques. The improvement of reliability and security in transportation is a common feature of all projects. Aviation research is focussed on projects such as AIRBUS, fighter aircraft, and helicopters. Spacelab and the development of suitable payloads are the central issues of the space research effort with emphasis on material and processing techniques as well as biophysics and biomedicine. Data acquisition, using sensors and processing of satellite and Spacelab data is actively pursued. Recent developments in the domain of turbomachinery, nonnuclear energy research, energy conservation, and high energy laser techniques are also discussed.

POTENTIAL REDUCTIONS IN AIRCRAFT OPERATION AND MAINTENANCE COSTS BY USING THRUST COMPUTING SUPPORT EQUIPMENT Report to the Honorable Joseph P. Addabbo, Chairman, Subcommittee on Defense, Committee on Appropriations, House of Representatives
27 Oct. 1981 17 p
(AD-A108463; GAO/PLRD-82-4) Avail: NTIS HC A02/MF A01 CSCL 01/2

This report addresses the evaluation of thrust measuring equipment. We interviewed Air Force officials and contractor representatives, reviewed documentation pertaining to the key events in the evaluation of the thrust computing system program, reviewed test data and analyses by Air Force and contractor engineers, and observed the operation of the thrust computing system. Our analyses show that the accurate measurement and setting of thrust for installed jet engines is of vital importance not only for aircraft readiness and safety but also for operation and maintenance cost reductions. Although test results indicate that a system is available that can perform such measurements, the services have not been using it. The Air Force has conducted extensive tests that will measure thrust for installed J85-5 engines, but has not implemented a system. The Navy has not performed any tests to determine whether its aircraft jet engines might benefit from such a system.

SOLAR POWER SATELLITES, SUMMARY
Aug. 1981 22 p
(OTA-E-145) Avail: NTIS HC A02/MF A01

The energy potential of the solar power satellite (SPS) was assessed. The preliminary nature of SPS technology was taken into account by comparing four alternative SPS systems across a broad range of issues: their technical characteristics long term energy supply potential, international and military implications, environmental impacts, and institutional effects. The SPS options were also compared to potentially competitive energy technologies in order to identify how choices among them might be made. In addition, a set of Federal research and funding options were developed to address the central questions and uncertainties identified in the report.

MICROMECHANISMS OF FRACTURE AND HYPOTHERMAL AGING OF FIBROUS COMPOSITES Final Report, 1 Aug. 1978 - 31 Dec. 1980
Peter W. R. Beaumont 28 Feb. 1981 73 p refs
(Grant AF-AFOSR-3644-78; AF Proj. 2307)
(PB82-121369; CUED/C-MAT/TR-76-181) Avail: NTIS HC A04/MF A01 CSCL 11D

The micromechanisms of crack extension of carbon fibers, glass fibers, and hybrid composites containing glass fibers, and carbon fibers in epoxy and polyester resins were studied. A new collection of failure data based on observations of fibers debonding snapping and pulling out was summarized in cumulative probability diagrams and analyzed using Weibull distribution parameters. This data, together with models of failure processes and information of work of fracture, is used to construct fracture mechanism diagrams. These diagrams, together with the Weibull parameters may help in distinguishing between mechanisms of fracture give guidance in selecting a material system and in isolating aging and environmental effects.

SELECTIVE JET PLATING Ph.D. Thesis
Tan-Jen Chen 1981 204 p
Avail: Univ. Microfilms Order No. 8127565

The use of an unsubmerged impinging jet system for selective plating is proposed. A theoretical analysis, which accounted for the charge transfer, mass transfer, and ohmic resistance effects, was developed to predict the current distributions along the cathode. Three electrochemical systems were employed in an experimental jet plating cell to demonstrate the validity of the model. The current distributions were measured with controlled variation of jet Reynolds number, nozzle-to-cathode distance, solution specific conductivity, and reactant concentration. Upon demonstrated to be valid, the theoretical model was used to predict the cell performance under a wide range of parameter values.

EXPERIMENTAL AND THEORETICAL STUDIES ON GAS CYCLONE SEPARATORS OPERATING AT HIGH EFFICIENCY Ph.D. Thesis
Thinh Van Tran 1981 161 p
Avail: Univ. Microfilms Order No. 8126034

It was shown that wall friction has negligible effect on particle motion, but dust particles on the wall move much more slowly than the surrounding gas, due to crowding. It was found that re-entrainment of particles in the region near the cone apex of a cyclone is a significant factor affecting collection efficiency of low and moderate efficiency cyclones. A theory on the secondary flow along the cone wall was developed. Short circuit flow on the top of a cyclone was also studied. The effect of this flow on efficiency was also studied. The secondary flow velocity was found to be dependent on inlet geometry and is of order of 15% that of the main flow. A simplified theory was developed to give the flow field in gas cyclones. It was shown that the particle volume fraction inside the dust spiral on a cyclone wall is of the same order as the emulsion phase in fluidized systems.

FREQUENCY RESPONSE ANALYSIS OF DISTILLATION COLUMN INTERACTION Ph.D. Thesis
Chien Wang 1981 338 p

Avail: Univ. Microfilms Order No. 8126983

A dynamic pressure model of multicomponent distillation is developed in the frequency domain. The model consists of a set of linearized overall and component balances, enthalpy balance, pressure relationship, hydraulic equation and equilibrium relationships for each tray, the condenser and the reboiler of a general column. A numerical method consisting of total scaled pivoting Gaussian elimination with the method of residues is worked out for solving the model in the frequency domain to obtain all of the desired transfer functions. As a result, this analysis can be useful in defining the control problem and predicting interaction difficulties. The computer program developed can be used to study the effect of different model simplifying assumptions. The models studied were pressure model, enthalpy model and quimolar overflow model. A steady state program and a mechanical design program were also developed.

IDENTIFYING AND DETERMINING HALOCARBONS IN WATER USING HEADSPACE GAS CHROMATOGRAPHY

Daniel C. Leggett Oct. 1981 17 p refs

(Proj. CWIS-31281)

(AD-A108345; CRREL-SR-81-26) Avail: NTIS HC A02/MF A01 CSCL 07/4

Since the discovery that chloroform and other haloforms are produced during water chlorination, methods have been needed for their routine analysis. This report describes the application of the multiple equilibration headspace technique for the determination of halocarbons in water. This method has certain advantages over solvent extraction and direct injection techniques, including greater sensitivity because of the favorable gas/liquid distribution ratios. It is simpler and faster than purge and trap and resin sorption methods and gives more information about compound indentity than single headspace analysis because gas/liquid distribution ratios are determined experimentally. The method is absolute, unlike solvent extraction, resin sorption, purge and trap, and conventional headspace analysis, which require standard additions to correct for incomplete recovery. The use of the technique to analyze chlorinated water samples for haloforms revealed a potential problem in their analysis. Haloforms continued to form for 24 hours, even after destruction of chlorine residuals with thiosulfate. Maximum haloform concentrations were observed in undechlorinated samples only after a 48 hour aging period. GRA

REPORT ON THE EXPERIENCES WITH THE GAS COMPRESSION HEAT PUMP SYSTEM OF THE SCHOOL AND SPORTS CENTER AT ALTENKUNSTADT Final Report, Dec. 1980

Fritz Tscherter Bonn Bundesministerium fuer Forschung und Technologie Oct. 1981 109 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie

(BMFT-FB-T-81-175; ISSN-0340-7608) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 23,10

Three years of operation of a 1200 kw natural gas boiler system supplemented by a 800 kw gas heat pump system are evaluated and the savings in primary energy are assessed. Setup, control system and measuring instrumentation are described. The proximity of a river allows an hybrid operation whereby 100% of the heat is produced by the gas powdered heat pump for any river temperature above 3 C whereas below that temperature the gas boiler takes over completely. Annual heat pump heating figures between 1.66 and 1.72 were obtained, thus yielding a saving in primary energy between 36% and 47%, in good agreement with the design values. The cost analysis shows that the savings thus achieved cover the operating costs specific to the heat pump. Author (ESA)

OPEN-CYCLE VAPOR COMPRESSION HEAT PUMP Annual Progress Report, 1980

Ravi Sakhuja and Frederick E. Becker 5 May 1981 54 p

(Contract GRI-5011-342-0094)

(PB82-110503; TE4224-243-81; GRI-80/0064) Avail: NTIS HC A04/MF A01 CSCL 13A

Recovery and upgrading of low-grade steam or waste heat sources offers a great potential of energy conservation. Thermo Electron is developing an open cycle vapor compression steam heat pump to meet this objective. The system utilizes excess low-pressure steam or that produced from an industrial excess heat source with a waste heat boiler and compresses this steam to the desired pressure level for process use. The compressor is driven by a prime mover such as a gas turbine, gas engine, etc. The prime mover exhaust heat also can be recovered to generate additional process steam. The fuel consumption of this system can be as low as 30 to 50 percent in comparison to a direct-fired boiler over the expected range of process conditions. Simple payback periods as low as one year can be achieved. GRA

DEVELOPMENT OF A MULTIDETECTOR PETROLEUM OIL IN WATER MONITOR Final Report, May 1978 - Jan. 1981

Robert W. Melvold Sep. 1981 90 p refs

(Contract EPA-68-03-2648)

(PB82-105206; EPA-600/2-81-206) Avail: NTIS HC A05/MF A01 CSCL 14B

A prototype petroleum oil-in-water monitoring system that continuously measures oil (whether free, suspended, dissolved, or emulsified) in water carrying a variety of potential interfering substances was developed. An extensive desk-top survey of commercially available oil monitors was carried out. Three devices were selected for thorough laboratory evaluation: (1) Sigrist Fluorescence Monitor Model FLJ, (2) CE Invalco D.O.W. Monitor, and (3) Horiba OCMA-25 Oil Content Monitor. The construction of a flow loop and its operation, the installation of the selected detectors in the breadboard system, the development of a data retrieval system, the calibration methodology employed, the initial checkout of the detectors, and the extensive multidetector evaluation of each detector's performance for quantifying petroleum oil in the presence of impurities and other interferents are described. A LAND USE ANALYSIS OF EXISTING AND POTENTIAL COAL SURFACE MINING AREAS IN THE OHIO RIVER BASIN ENERGY STUDY REGION

Daniel E. Willard, Michael A. Ewert, Mary Ellen Hogan, and Jeffrey D. Martin Apr. 1981 136 p refs

(Contract EPA-R-805588)

(PB82-105172; EPA-600/7-81-068) Avail: NTIS HC A07/MF A01 CSCL 08I

The land use changes resulting from the surface mining of coal in the Ohio River Basin, which depend on the distribution of the coal, the economic attractiveness of the coal demand, rigor and effectiveness of regulatory mechanisms, and the resilience of the existing ecosystems are reported. The three levels of coal demand assumed are taken from ORBES scenarios. The study analyzes existing industrial and governmental data on distribution, availability, and extraction of strippable coal. The history of reclamation enforcement and compliance is examined, and several potential land use results of the Federal Surface Mining Control and Reclamation Act of 1977 are analyzed. All of these factors are compared to existing patterns of topography, agriculture, and forestry. GRA

COAL MINE SITING FOR THE OHIO RIVER BASIN ENERGY STUDY

Donald A. Biorne Sep. 1981 180 p refs

(Grant EPA-R-805590)

(PB82-108119; EPA-600/7-81-116) Avail: NTIS HC A09/MF A01 CSCL 08I

In part 1, an overview of the ORBES region coal industry is presented. (The region consists of all of Kentucky, most of West Virginia, and substantial portions of Illinois, Indiana, Ohio, and Pennsylvania). Topics include coal production, mine types, reserves, selected coal properties, coal markets, employment, working conditions, wages, and quality of life. In part 2, the procedures for siting coal mines under the ORBES energy development scenarios are set forth. The coal mine siting analysis projects at the county level the number and type of new coal mines that would be opened in the ORBES region through the year 2000

under various scenario conditions and constraints. Among these conditions and constraints are the locational siting pattern of additional power plants in each scenario, the total coal production specified for the year 2000 by the ORBES energy demand model, and the sources of high and low sulfur coal, by mine type, specified by the ORBES coal supply analysis. ENERGY POLICIES FOR RESILIENCE AND NATIONAL SECURITY Final Report
Amory B. Lovins and L. Hunter Lovins Oct. 1981 322 p refs
(Contract DCPA01-79-C-0317)
(AD-A108263) Avail: NTIS HC A14/MF A01 CSCL 15/3

The vulnerabilities of the U.S. energy system to accidental or deliberate disruptions are analyzed generically and specifically and shown to be disturbingly large. Since they arise from reliance on highly centralized technologies, increasing such reliance is likely to increase national energy vulnerability. A more efficient, diverse, dispersed, renewable energy system is shown to be inherently more resilient, to make major failures impossible, and to be compatible with consistent adherence to free-market principles. FEASIBILITY STUDY ON ENERGY RECOVERY AND COGENERATION FROM AN EXISTING MUNICIPAL INCINERATOR, PHASE 1 Final Report
Jul. 1981 458 p refs
(Contract DE-FG01-79CS-20232)
(DE82-001143; DOE/CS-20232/1) Avail: NTIS HC A20/MF A01

A feasibility study of recovering and converting incinerator waste heat energy into steam and electricity for use in the facility with excess electricity being sold to the local utility was made. Energy recovery would be accomplished by retrofitting each furnace with a waste heat boiler and producing steam for heating and for driving steam turbine electric generators. Preliminary designs economic analyses, and financial plans were prepared. The quantity of municipal refuse was identified and the electric revenues needed for project justification were calculated. For the purpose of obtaining accurate design data, field tests were carried out on the actual refuse and combustion process. DOE

CYCLE: A GENERAL COMPUTER CODE FOR THERMODYNAMIC CYCLE COMPUTATIONS. STUDIES OF COGENERATION IN DISTRICT HEATING SYSTEMS
J. A. Miedema Sep. 1981 272 p refs
(WTHD-135) Avail: NTIS HC A12/MF A01

Computer programs which determine the energy consumption of heat power units, calculate the energy consumed by large scale district heating systems, compute the energy consumption per unit heat (f factor), and estimate the effect of dual purpose units on energy production/consumption of a regional scale power network were developed. District heating systems were assessed, using the programs. Systems with steam and gas units have lowest f factors. Regional power production efficiency is influenced by dual purpose units. The influence must be calculated for each case separately. Accurate computation of the f factor is urged since it is directly linked to the benefits/cost ratio. Author (ESA)

INDUSTRIAL BURNER AND PROCESS EFFICIENCY PROGRAM Annual Report, Jan. - Dec. 1980
S. R. Huebner and S. N. Prakash Mar. 1981 96 p refs
(GRI Proj. 5011-342-0148)
(PB82-115486; GRI-80/0059; Rept-1228) Avail: NTIS HC A05/MF A01 CSCL 13A

A laboratory prototype burner which is compatible with a FM (frequency modulation) combustion control system where temperature control is accomplished by regulating the ratio of burner on-time to burner off-time was developed. This multifuel (natural gas and No. 2 fuel oil) high velocity burner is capable of repeated pulse ignition at maximum rated capability (1 million Btu-hour) with preheated air (from ambient to 1100F). A digital control in the FM mode was developed. Experimental data from tests in a laboratory furnace indicated that when applied to a batch type thermal process where appreciable turndown is presently obtained by excess air operation, the FM combustion system provides improvements in process fuel efficiency and gains in productivity. HC A05/MF A01 CSCL 10A

Energy consumption data for the year 1975 for the states of Illinois, Indiana, Kentucky, Ohio, Pennsylvania, and West Virginia, as well as for the United States as a whole is presented. Energy use is examined both by consuming sector and by fuel source. The principal components of each sector are described briefly, and detailed comparisons are made among national, six-state, and individual state consumption patterns for 1975. Preliminary estimates are given for total energy consumption in the United States, the six states, and individual states for the years 1976, 1977, and 1978. GRA

HC A14/MF A01 CSCL 13B

An environmental data acquisition program involving a commercial scale, medium Btu, Lurgi gasification plant in the Kosovo region of Yugoslavia is described. The objective of the program was to characterize potential environmental problems associated with coal gasification in a Lurgi plant. The primary conclusion of the environmental assessment mode is that the process exhibits a significant potential for pollution. All discharge streams are potential vehicles for pollutant transfer from the process to the environment. The streams with the highest priority for control based on their potential for adverse health effects in the three discharge media, are the H2S rich waste gas, phenolic wastewater, and heavy tar. EMISSIONS ASSESSMENT OF CONVENTIONAL STATIONARY COMBUSTION SYSTEMS: SUMMARY REPORT Final Report, Sep. 1976 - Jul. 1981
C. C. Shih and A. M. Takata Sep. 1981 77 p refs
(Contract EPA-68-02-2197)
(PB82-109414; EPA-600/7-81-003D) Avail: NTIS
HC A05/MF A01 CSCL 13B

Results of a characterization of multi-media emissions from 39 source categories of conventional stationary combustion systems are reported. In the assessment, existing emissions data were first examined to determine the adequacy of the data base. This was followed by a measurement program to fill identified data gaps. Emissions data obtained from the sampling and analysis program were combined with existing emissions data to provide estimates of emission levels, and to define the need for additional data. Study results indicate that flue gas emissions of NOx, SO2, and particulate matter from the 39 source categories account for approximately 86, 66, and 36%, respectively, of the emissions of these pollutants from all stationary sources. Additionally, flue gas emissions of sulfates and several trace elements from coal- and oil-fired combustion sources also require further attention. GRA

INVENTORY OF EMISSIONS FROM MARINE OPERATIONS WITHIN THE CALIFORNIA COASTAL WATERS Final Report

W. C. Kelly, L. R. Reckner, and G. D. Maines 26 Jun. 1981 222 p refs
(Contract ARB-A5-209-30)
(PB82-105099; Rept-2581-01-0881; ARB-R-81/40) Avail: NTIS HC A10/MF A01 CSCL 13B

The magnitude of air polluting emissions from marine vessels and marine related activities in the coastal waters and ports of California is studied. Major sources of emissions included the operation of marine engines and auxiliary power plants; the transport, handling, storage and transfer of petroleum and petroleum products, and the ballasting and lightering associated with tanker vessel operations. The record of activity of every commercial vessel operating in the waters of California was traced and the emissions were calculated for each activity of these vessels. The average daily emissions were - NOx 41.4 tons per day (tpd), CO 8.3 tpd, SO2 79.2 tpd, hydrocarbons 21.5 tpd, and particulates 7.6 tpd. GRA

EPA UTILITY FGD (FLUE GAS DESULFURIZATION) SURVEY Final Report, Apr. - Jun. 1981

M. Smith, M. Melia, N. Gregory, and R. McKibben Aug. 1981 335 p
(Contract EPA-68-02-3173)
(PB82-115858; EPA-600/7-81-012D) Avail: NTIS HC A15/MF A01 CSCL 13B

A survey of operational and planned domestic utility flue gas desulfurization (FGD) systems, operational domestic particle scrubbers, and Japanese coal-fired utility FGD installations is presented. It summarizes information contributed by the utility industry, system and equipment suppliers, systems designers, research organizations and regulatory agencies. It presents data on system design, fuel characteristics, operating history, and actual performance. Unit by unit dependability parameters are included and problems and solutions associated with the boilers, scrubbers, and FGD systems are discussed. The domestic FDG systems are tabulated alphabetically by development status (operational, under construction, or in the planning stages), utility company, system supplier, process, waste disposal practice, and regulatory class. NASA TECHNOLOGY UTILIZATION HOUSE TECHNICAL SUPPORT PACKAGE SUMMARY OF RESULTS AND HOUSE DESCRIPTION Final Report

Aug. 1979 83 p
(NASA-TM-X-74686) Avail: NTIS HC A05/MF A01 CSCL 13M

The Technology Utilization House (Tech House) was designed and constructed to demonstrate to the building industry and the public the benefits of aerospace technology and other new technology that are presently available or will be in very near future. Use of solar energy, conservation of energy and of water, safety, and security were incorporated in the design of the house. The terms to be incorporated into the house and to assist in the design of the house were evaluated. An architectural engineering team was employed to investigate energy conservation ideas, determine cost effectiveness of new materials and systems, and prepare specifications and drawings for the house. The Tech House was constructed during the spring of 1976. All the systems were monitored to insure proper operation, and data were collected during a one year occupancy. Results obtained during the family live-in period, comments on the acceptance of the various energy-saving systems by the family, and suggestions for improvement of the systems are presented. N.W.

CONVENTIONAL ENGINE TECHNOLOGY. VOLUME 1: STATUS OF OTTO CYCLE ENGINE TECHNOLOGY

M. W. Dowdy 15 Dec. 1981 216 p refs
(Contracts NAS7-100; DE-AI01-80CS-50194)
(NASA-CR-168643; JPL-Pub-81-65-Vol-1; DOE/CS-50194/1)
Avail: NTIS HC A10/MF A01 CSCL 21A

Federally-mandated emissions standards have led to major changes in automotive technology during the last decade. Efforts to satisfy the new standards were directed more toward the use of add-on devices, such as catalytic converters, turbochargers, and improved fuel metering, than toward complete engine redesign. The resulting changes are described and the improvement brought about by them in fuel economy and emissions levels are fully documented. Four specific categories of gasoline-powered internal combustion engines are covered, including subsystem and total engine development. Also included are the results of fuel economy and exhaust emissions tests performed on representative vehicles from each category. Author

N82-19543*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
CONVENTIONAL ENGINE TECHNOLOGY. VOLUME 2: STATUS OF DIESEL ENGINE TECHNOLOGY

H. W. Schneider 15 Dec. 1981 191 p refs
(Contracts NAS7-100; DE-AI01-80CS-50194)
(NASA-CR-168644; JPL-Pub-81-65-Vol-2; DOE/CS-50194/1)
Avail: NTIS HC A09/MF A01 CSCL 21A

The engines of diesel cars marketed in the United States were examined. Prominent design features, performance characteristics, fuel economy and emissions data were compared. Specific problems, in particular those of NO and smoke emissions, the effects of increasing dieselization on diesel fuel price and availability, current R&D work and advanced diesel concepts are discussed. Diesel cars currently have a fuel economy advantage over gasoline engine powered cars. Diesel drawbacks (noise and odor) were reduced to a less objectionable level. An equivalent gasoline engine driveability was obtained with turbocharging. Diesel manufacturers see a growth in the diesel market for the next ten years. Uncertainties regarding future emission regulation may inhibit future diesel production investments. With spark ignition engine technology advancing in the direction of high compression ratios, the fuel economy advantages of the diesel car is expected to diminish. To return its fuel economy lead, the diesel's potential for future improvement must be used. Author

CONVENTIONAL ENGINE TECHNOLOGY. VOLUME 3: COMPARISONS AND FUTURE POTENTIAL

M. W. Dowdy 15 Dec. 1981 32 p ref
(Contracts NAS7-100; DE-AI01-80CS-50194)
(NASA-CR-168645; JPL-Pub-81-Vol-3; DOE/CS-50194/1)
Avail: NTIS HC A03/MF A01 CSCL 21A

The status of five conventional automobile engine technologies was assessed and the future potential for increasing fuel economy and reducing exhaust emission was discussed, using the 1980 EPA California emisions standards as a comparative basis. By 1986, the fuel economy of a uniform charge Otto engine with a three-way catalyst is expected to increase 10%, while vehicles with lean burn (fast burn) engines should show a 20% fuel economy increase. Although vehicles with stratified-charge engines and rotary engines are expected to improve, their fuel economy will remain inferior to the other engine types. When adequate NO emissions control methods are implemented to meet the EPA requirements, vehicles with prechamber diesel engines are expected to yield a fuel economy advantage of about 15%. While successful introduction of direct injection diesel engine technology will provide a fuel savings of 30 to 35%, the planned regulation of exhaust particulates could seriously hinder this technology, because it is expected that only the smallest diesel engine vehicles could meet the proposed particulate requirements. REVIEW OF THE UK TRANSPORT ENERGY OUTLOOK: AND POLICY RECOMMENDATIONS
1981 43 p refs
(EP-47; ACEC-Paper-11) Copyright. Avail: Issuing Activity; HMSO £4 + postage, PHI

Liquid fuel consumption for transport (excluding international bunkers for ships) in 1979 is analyzed and used to forecast the position at the end of the century. Car population is expected to increase by 6 million to over 20 million, but fuel saving designs mean that fuel consumption increases only slightly. Truck fuel consumption stays the same. Fuel consumption by UK airlines is expected to double. The proportion of a barrel of crude oil which is refined as transport fuel must be increased. Author (ESA)

ENERGY CONSERVATION IN THE PRODUCTION OF DOMESTIC HOT WATER
1981 23 p refs
(EP-48; ACEC-Paper-12) Copyright. Avail: Issuing Activity; HMSO £2.80 + postage, PHI

Improvements in energy efficiency in existing buildings and the construction of energy efficient buildings are discussed with emphasis on water heating. Cost effective measures proposed include fitting an 80-mm insulating jacket to the hot water storage cylinder, using time switches, fitting thermostatic control systems to boiler based central heating, and storing domestic hot water at a lower temperature. Research into the recovery of heat from waste water, the use of cold water detergents, and the use of heat pumps is urged. Author (ESA)

TIDAL POWER FROM THE SEVERN ESTUARY, VOLUME 1
1981 125 p refs Original contains color illustrations 2 Vol.
(EP-46 Vol-1; ISBN-0-11-410916-8) Copyright. Avail: Issuing Activity; HMSO £9.80 + postage, PHI

Environmental, energy, and economic factors associated with building a tidal power barrage in the Bristol channel were studied. An ebb generation scheme is recommended since it minimizes the unit cost of electricity generation and has less effect on ports than flood or two way generation. The economic justification for a barrage depends on factors which are not known when the decision on whether to build is taken, e.g., the extent of nuclear generation, or the price of coal in the first third of the next century. Further study of the environmental consequences of the barrage is required. An inner barrage is recommended since the larger output of an outer barrage does not outweigh engineering, environmental and economic disadvantages. Author (ESA)

LIFE ON A WARMER EARTH: POSSIBLE CLIMATIC CONSEQUENCES OF MAN MADE GLOBAL WARMING
H. Flohn 1981 80 p refs
(ER-3) Copyright. Avail: Issuing Activity

The interaction between energy and climate is explored, including the impact on global climate of three main energy sources: solar, nuclear and fossil fuels. The global warming problem is introduced. Comprehensive analogies with warmer times are made. From the best models available, the future global average surface temperature is found and modified, describing the global warming effects caused by greenhouse effect caused by gases other than carbon dioxide, released into the atmosphere by man, i.e. nitrous oxide, methane, ammonia, and the chlorofluoromethanes. Paleoclimatic scenarios are reviewed, showing possible effects of global warming. An 800 to 1100 ppm CO_2 concentration causes irreversible Arctic melting, leading to displacement of present climatic zones by 400 to 800 km. Author (ESA)

PRELIMINARY RESULTS OF A STUDY OF MAPPING THERMAL DISCHARGE IN THE OCEAN, USING REMOTE SENSING DATA
Merritt Raymond Stevenson, Carlos Alberto Steffen, and Hector Manual Inostroza Villagra Sep. 1981 23 p refs In PORTUGUESE; ENGLISH summary Presented at 33d Ann. Meeting of SBPC, Salvador, 8-15 Jul. 1981
(INPE-2229-PRE/021) Avail: NTIS HC A02/MF A01

The spatial and temporal variations of the sea surface temperature, utilizing data obtained from sea surface, aircraft and satellite platforms were studied. The objective of the study is the evaluation and mapping of small scale variations in the sea surface temperature, caused by the thermal discharge from a nuclear power plant at Angra dos Reis, Brazil. Evaluation of data from ANGRA 01, the first experiment made on December 19, 1980, showed the surface temperature to be quite isothermal. Temperature from the aircraft and satellite radiometers were about 0.6 C and 5.0 C cooler, respectively, than the temperatures measured from the boat. These thermal offsets are readily accounted for by differences in emissivities of the sea surface and the intervening water vapor in the lower atmosphere. Author

URBAN TRAFFIC SIGNAL CONTROL FOR FUEL ECONOMY. PART 2: EXTENSION TO SMALL CARS

G. S. Messenger Nov. 1981 13 p refs
(AD-A109393; DME-ME-249; NRC-19846) Avail: NTIS HC A02/MF A01 CSCL 13/6

Use of a small car's characteristics in a simulation program utilizing velocity profiles obtained in a traffic study by the Metropolitan Toronto Roads and Traffic Department and the Engine Laboratory at the National Research Council Canada has shown that trends shown in fuel consumption in NRC, Division of Mechanical Engineering Report No. ME-247 are similar for a small-engined vehicle. NRC, DME Report No. ME-247 showed that under the TRANSYT timing plan vehicles encountered fewer stops, saved time and used a slightly smaller amount of fuel than under the existing timing plan. In the above mentioned report, a large vehicle's fuel consumption was calculated using a computer model of the vehicle which used velocity profiles obtained from an instrumented floating car. GRA

SYNTHETIC-FUEL COMBUSTION: POLLUTANT FORMATION. SOOT-INITIATION MECHANISMS IN BURING AROMATICS Fourth Quarterly Report, 1 Jul. - 30 Sep. 1981
W. T. Rawlins, S. P. Schertzer, and T. Tanzawa Nov. 1981 43 p refs
(Contract DE-AC22-80PC-30292)
(DE82-002566; DOE/PC-30292/4; PSI-TR-291) Avail: NTIS HC A03/MF A01

The pyroiysis rates, free radical kinetics, and soot and NO/sub x/ formation mechanisms for a variety of aromatic families such as those of benzene, anisole, phenol, and nitrogen heterocyclics were examined. The processes are studied in shock tubes, where combustion temperatures is attained almost instantly without wall effects and under well controlled flow conditions. Experiments are performed in incident shock waves, using optical absorption and emission diagnostics in the ultraviolet, visible, and infrared. It is indicated that soot formation is minimal for pyridine and proceeds rapidly for toluene, and a bimodal mechanism above 2000 K is shown. Comparison of ultraviolet and visible attenuation signals indicates that the mean size of the soot particles causing the attenuation is considerably larger than previously assumed, and requires the use of complete Mie theory rather than the Rayleigh limit in data interpretation. HEAT PUMP WATER HEATER: MIDWAY RESIDENTIAL COMMUNITY Final Report
J. R. Aguilar and Jon R. Biemer Oct. 1981 63 p refs Sponsored by DOE
(DE82-003548; DOE/BP-53) Avail: NTIS HC A04/MF A01

A prototype heat pump water heater was tested. Five heat pump water heaters were installed in a residential community at Midway, Washington, and their performance was monitored between September 1979 and January 1981. The objectives of the project were to evaluate performance, to assess equipment reliability, and to determine energy savings. Results were also used to assess the heat pump water heater's potential contribution to energy conservation in the Pacific Northwest. The coefficient of performance (COP) and energy savings compared to an electric resistance water heater are 1.66 and 40%, respectively. Because the COP of a heat pump water heater varies with the ambient temperature, performance of a unit affected by seasonal and climatic variation. The energy savings of individual heat pump

water heaters will vary from 41 to 56% in the Pacific Northwest, depending on climatic conditions. DOE

COAL WASTE ARTIFICIAL REEF PROGRAM, PHASE 3. VOLUME 1: SUMMARY REPORT Interim Report, Oct. 1981
J. H. Parker, P. M. J. Woodhead, I. W. Duedall, and H. R. Carleton Oct. 1981 79 p refs Sponsored by Electric Power Research Institute
(EPRI Proj. 1341-1)
(DE82-900854; EPRI-CS-2009-Vol-1) Avail: NTIS HC A05/MF A01

The technical feasibility and the environmental effects of a method for ocean disposal of fly ash and scrubber sludge were

explored. Techniques were developed for coal waste block fabrication utilizing machines and equipment from the concrete block industry. Accelerated steam curing procedures developed block strengths adequate for industrial handling and stacking. The new fabrication techniques were successfully established at commercial block factories and 450 metric tons (500 short tons) of stabilized wastes were processed into about 15,000 reef-blocks. Two waste materials were used with fly ash to sludge ratios of 4:1 and 1.5:1 respectively. Small numbers of blocks were made separately from fluidized bed combustion residues. In laboratory bioassays and in field tests, the material did not appear to be toxic in the sea. These results all suggested that the blocks are compatible with the marine environment. T.M.

ELECTROCYCLONE DEVELOPMENT PROGRAM Quarterly Technical Report, Feb. - Apr. 1981
1981 43 p
(Contract DE-AC21-80ET-17091)
(DE81-025062; DOE/ET-17091/T2; FE-7091-10) Avail: NTIS HC A03/MF A01

In response to the need for a high efficiency, high throughput gas cleanup device for pressurized fluidized bed application, General Electric experimented with an elecrostatically augmented cyclone. A principal advantage of the GE Electrocyclone concept is that a 12 ft dia unit can be built with performance comparable to a 10 in conventional cyclone. The use of large Electrocyclones will avoid the plugging and flow imbalance problems which plagued the use of multiclones. The development work is being continued under the present Electrocyclone Development Program. The Electrocyclone Development Program addresses three critical development areas: performance scaleup; performance at high temperature and pressure; and corona charging. The scaleup of Electrocyclone performance will be demonstrated experimentally by cold flow testing of a 36 in-dia unit geometrically similar to the earlier 18-in model. DOE

ENVIRONMENTAL AND ECONOMIC ASPECTS OF INDIRECT COAL LIQUEFACTION PROCESSES: A REPORT EMPHASIZING THE RELATIONSHIP BETWEEN PRODUCT MIX AND EFFICIENCY
Lawrence Hoffman Sep. 1981 40 p refs
(Contract EPA-68-02-3671)
(PB82-103581; EPA-600/7-81-153) Avail: NTIS HC A03/MF A01 CSCL 07A

Environmental and economic aspects of three indirect liquefaction processes are reported. The following are addressed: U.S. coal resources; indirect coal liquefaction processes; and environmental and economic aspects associated with the considered processes. The conservation of coal resources would be affected by conversion efficiencies, which vary with process and product mix. For the processes considered, for similar liquid to gas ratio values (product mix), the coal to methanol is the most efficient while the Fischer Tropsch is the least efficient. For these processes, the cost per Btu of product at reasonable equivalent liquid/gas ratios is greatest for Fischer Tropsch and the least for the coal to methanol process. GRA

The Gas Research Institute (GRI) is engaged in medium- to

long-range research and development in various sectors of the economy that depend on gasing technologies and equipment. To assess the potential demand for natural gas in the industrial sector, forecasts available from private and public sources were compared and analyzed. More than 20 projections were examined, and 10 of the most appropriate long-range demand forecasts were analyzed and compared with respect to the various assumptions, methodologies and criteria on which each was based. SEDIMENTATION PLAN TO ASSESS THE IMPACT GEOTHERMAL ACTIVITIES TO THE AQUATIC ECOSYSTEM IN THE GEYERS CALISTOGA KGRA
Robert R. Ireland 19 May 1981 45 p
(Contract W-7405-eng-48)
(DE82-001688; UCID-19059) Avail: NTIS HC A03/MF A01

The prevention of sedimentation or siltation in aquatic ecosystems is always a key enviromental issue in the development and operation of power plant units. A field program, which will assess the amount of sedimentation in the streams and tributaties of the Geysers-Calistoga Known Geothermal Resource Area (KGRA) due to development-related or other site-specific activities. This sediment plan is one part of a four part venture - the others are water quality, benthic invertebrates and fisheries studies. Included are the cost breakdowns for each phase, maps and rationale of the sampling sites, the methodology for the laboratory sample processing, and examples of the type of graphic and tabular output expected. BASELINE HEALTH EFFECTS DATA APPLICABLE TO ANTICIPATED GEOTHERMAL RESOURCE DEVELOPMENT IN IMPERIAL COUNTY Final Report
Margaret Deane and Jeffrey L. Hahn Jun. 1981 17 p Prepared in cooperation with California Dept. of Health Services
(Contract W-7405-eng-48)
(DE82-001669; UCRL-15391) Avail: NTIS HC A02/MF A01

The effects of budget cuts on the original contract proposal are described. A task by task description of the program is presented including results and outcome of the task. DOE

N82-21783# California Univ., Livermore. Lawrence Livermore Lab.
IMPERIAL COUNTY BASELINE HEALTH SURVEY POTENTIAL IMPACT OF GEOTHERMAL ENERGY
Margaret Deane (Calif. State Dept. of Health Services) Jun. 1981 169 p
(Contract W-7405-eng-48)
(DE82-001672; UCRL-15392) Avail: NTIS HC A08/MF A01

The survey purpose, methods, and statistical methods are presented. Results are discussed according to: area differences in background variables, area differences in health variables, area differences in annoyance reactions, and comparison of symptom frequencies with age, smoking, and drinking. Included are tables of data, enumeration forms, the questionnaire, interviewer cards, and interviewer instructions. T.M.

NO SUB x REGULATORY CHANGES AND THE ELECTRIC UTILITY: A GUIDANCE MANUAL FOR AIR QUALITY MODELING IN PLANNING, SITING, AND EMISSIONS CONTROL Final Report
S. R. Hayes, P. D. Gutfreund, S. D. Reynolds (KVB, Inc., Irvine, Calif.), R. Pease (KVB, Inc., Irvine, Calif.), and L. Muzio Sep. 1981 149 p refs Sponsored by Electric Power Research Inst.
(EPRI Proj. 1375)
(DE82-900966; EPRI-EA-2050) Avail: NTIS HC A07/MF A01

Several regulatory changes that are likely to influence requirements for the control of nitrogen oxide emissions from power plants are discussed. The possible requirement for a short-term ambient standard for NO2, prevention of significant deterioration rules for NO2, and visibility protection regulations are also discussed. A guidance manual, a reference document designed primarily for the utility reader, is presented. The potential implications of the possible NO/sub x/-related regulations, current regulatory and permitting requirements, and surveys of NO/sub x/ control technology costs and capability are evaluated. The conduct of a NO2 air quality impact analysis is also discussed. Other topics presented include: a modeling strategy: screening analysis; and selection of appropriate models, data requirements, and costs. M.D.K.

GEOLOGICAL DISPOSAL OF HIGH-LEVEL RADIOACTIVE WASTES
D. F. Coates, G. Larocque, and L. Geller 1980 23 p
(CANMET-79-29) Avail: NTIS (US Sales Only) HC A02/MF A01; DOE Depository Libraries

The problem of safe disposal of various types of radioactive wastes from nuclear power plants is discussed. Mining waste and mill tailings containing toxic radium are produced in large quantities. It is believed about 80 million tons have already accumulated at Elliot Lake, Ontario, alone and that this may increase by the year 2000 to several hundred million tons. These tailings are in bulk but relatively low in radioactivity. Wastes from nuclear generating stations, on the contrary, are highly radioactive but relatively small in volume. A brief overview of how electricity is generated by means of nuclear power, and reasons which render safe disposal of high-level nuclear wastes a particularly difficult and multifaceted problem are discussed. It is suggested that under Canadian conditions deep underground burial of these wastes in mined-out facilities in igneous rocks is the most acceptable solution. M.D.K.

OPTIMIZATION PROGRAMS FOR ECONOMIC ENERGY MODELLING PROBLEMS
Susan M. Hodson Oct. 1981 43 p refs
(Contract EEC-680-79-1-EM-UK)
(NPL-DNACS-51/81; EUR-7548-EN; ISSN-0143-734X) Avail: NTIS HC A03/MF A01

The use of MINOS and MINOS/AUGMENTED programs in linear programming and nonlinear optimal control models is described. The programs take advantage of general sparsity in the matrix of first derivatives of the constraints, which allows the solution of large problems, like finding the optimal fuel-mix and investment proposals to minimize the overall discounted cost covering all the supply utilization sectors of the energy system on a multinational, multiperiod scale. A model is used which predicts aggregate final energy demand and aggregate costs for the European economies over a 10 yr period. Author (ESA)

URBAN CONSORTIUM Final Report
J. K. Parker 1981 10 p
(Grant NSF ISP-78-12729)
(PB82-122789; NSF/ISP-81020) Avail: NTIS HC A02/MF A01 CSCL 13B

Needs and priorities were assessed for the areas of transportation, community and economic development, and management, finance and personnel were evaluated. Workshops were conducted to (1) assess the condition of urban infrastructure and developing future policies; and (2) study the use of emerging energy technologies in urban management. A study of multi-year revenue and expenditure forecasting and a study on the use of fire data were made. City-led research projects included evaluating landfill gas as an energy source; developing methodol-

ogy for energy impact analysis of community development projects; developing a primary urban energy planning methodology handbook; and retrofitting municipal buildings with solar energy systems. GRA

02
SOLAR ENERGY

Includes solar collectors, solar cells, solar heating and cooling systems, and solar generators.

A82-18890 Combined photovoltaic/thermal solar array DC electrical model. J. S. Krikorian, Jr. *IEEE Circuits and Systems Magazine*, vol. 3, Dec. 1981, p. 7-13. 6 refs. Contract No. DE-AC03-79CS-30205.

An electrical model of a combined photovoltaic/thermal solar array has been developed to predict the steady state behavior of the line currents, power output and array voltage. The effects of temperature on the solar cell characteristics is included in the analysis. The model includes line isolation diodes and 'open cell' bypass diodes. A numerical procedure based on the Contraction Mapping Fixed Point Theorem is used to solve the associated nonlinear equations. (Author)

A82-19295 Performance of collector/storage solar water heaters - Arbitrary demand pattern. M. S. Sodha, P. K. Bansal, and N. D. Kaushik (Indian Institute of Technology, New Delhi, India). *Energy Conversion and Management*, vol. 21, no. 4, 1981, p. 229-238. 8 refs.

A82-19296 Selective blacks for enhanced photothermal solar energy conversion. R. C. Agarwal and P. K. C. Pillai (Indian Institute of Technology, New Delhi, India). *Energy Conversion and Management*, vol. 21, no. 4, 1981, p. 239-251. 112 refs.

The optical and physical requirements of selective surfaces for maximum absorption of solar thermal energy are reviewed, along with processes to fabricate the selective coatings. Noting that the solar energy which reaches the ground is usually in wavelengths of 0.3-2 microns, the desired qualities of coatings are listed as stability of performance, good adherence to the substructure, ease of application, low emissivity above two microns, and economical fabrication. Selective surfaces comprise absorber-reflector tandems, which allow or reflect IR passage, multilayer interference stacks, which involve successive deposition of metallic coatings, and controlled surface morphology, which entails either geometric irregularities, Mie scattering films, corrugated surfaces, or wire mesh surfaces. Preparation can be by electrodeposition, chemical conversion, spray pyrolysis, paint coatings, vacuum deposition, and chemical vapor deposition (CVD), which is stressed as offering the most attractive option for economical large scale coating of solar selective surfaces. M.S.K.

A82-19298 Model evaluation and optimum collector slope for a tropical country. H. P. Garg and S. N. Garg (Indian Institute of Technology, New Delhi, India). *Energy Conversion and Management*, vol. 21, no. 4, 1981, p. 299-312. 13 refs.

Various models for predicting the radiation on an inclined surface are compared and an anisotropic model is used to determine an optimum solar collector slope based on the maximum solar energy availability. The effectiveness of operating a receiver in three modes was examined: facing south with a variable tilt, a fixed tilt and azimuthal sun tracking, and sun-following with maintenance of normal incidence. Three pyranometers were employed to simulate receivers in the different modes. A single tilt equal to the latitude of the location was found to be optimum for a fixed tilt collector, while partially tracking collectors show no dependence on latitude. Partially tracking and fully tracking surfaces received 16-20% more radiation than fixed surfaces, although the gain with fully tracking surfaces exceeded the partially tracking by only 2.5%, which led to a recommendation for the partially tracking configuration. M.S.K.

A82-19448 Solar energy storage and thermal use of an unconfined aquifer. H. Umemiya, E. Haga, R. Miyazawa, and M. Urushidani (Yamagata University, Yonezawa, Japan). *Energy Developments in Japan*, vol. 4, July 1981, p. 15-30. Translation.

An experiment using a large area, shallow aquifer for seasonal thermal storage is discussed. Two wells were drilled 70 m apart and water was pumped up from one well during the winter, and drained over a rooftop to melt snow before running back into another well-bore. During the summer, the well water is pumped up from the cool well, through a solar collector (the rooftop), and back into the warm well. A collection efficiency of 70% was determined for the summer cycle, and winter use from March-December revealed a water temperature of 8.5 C with a total injected volume of 14,700 cu m. The subsequent discovery that water returned to the ground quickly rose 4 C in temperature was taken as proof that the unconfined aquifer washed out the cooler water, implying that a one-well system is sufficient as a snow melter and collector fluid source in the winter. M.S.K.

A82-19825 † Solar-energy perspectives (Perspektivy solnechnoi energetiki). Iu. S. Bortnikov, N. S. Lidorenko, G. F. Muchnik, S. V. Riabikov, and D. S. Strebkov. *Akademiia Nauk SSSR, Izvestiia, Energetika i Transport*, Nov.-Dec. 1981, p. 3-12. In Russian.

The current status and perspectives of solar energy utilization are briefly reviewed. Optimal techniques for the design and application of solar energy converters are described, and the possible contribution of solar energy to the future energy economy is assessed. Particular consideration is given to the role of satellite solar power stations. B.J.

A82-19876 Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, December 2-4, 1980, Proceedings. Conference sponsored by the Japan Society of Applied Physics and Science Council of Japan. *Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2. 244 p.

The state-of-the-art in amorphous solar cells is reviewed in terms of polycrystalline silicon solar cells, single crystal silicon solar cells, and methods of characterizing solar cells, including dielectric liquid immersion to increase cell efficiency. Compound semiconductor solar cells are explored, and new structures and advanced solar cell materials are discussed. Film deposition techniques for fabricating amorphous solar cells are presented, and the characterization, in addition to the physics and the performance, of amorphous solar cells are examined. M.S.K.

A82-19877 Invited - Recent progress in amorphous silicon research and photovoltaic applications in the U.S.A. J. L. Stone (Solar Energy Research Institute, Golden, CO). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 1-7. 19 refs.

The progress in the development of amorphous silicon solar cells is traced from 1969-1980, including ongoing research projects, divisions of research, and directions and techniques. Contracted studies are being undertaken of advanced amorphous materials, physical phenomena in amorphous materials, and new materials and techniques. Principal attention is being given to hydrogenated and fluorinated amorphous Si, amorphous B-H, amorphous Si-C, Si-Ge alloys, amorphous GaAs, and other modifiers. Thin film preparation methods such as glow discharge plasma deposition, reactive sputtering, CVD, and ion plating are being investigated. Efficiencies of 6% have been reached, and problems of dopant-Si alloy forming are discussed with a view to improving the conductivity of the doped layers by using fluorinated materials. A realistic goal of 8% is predicted in the near term, and 10% in the 1990's. M.S.K.

A82-19878 An analysis of EBIC response of ITO/poly-Si solar cells. N. Inoue, T. Miyakawa (Defence Academy, Yokosuka, Japan), and C. W. Wilmsen (Colorado State University, Fort Collins, CO). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 11-15. 6 refs. Contract No. XS-9-8232-1.

An EBIC technique is applied to the grain boundaries of an ITO/poly-Si solar cell in order to investigate the effect of grain boundaries on solar cell output. The results are well explained by solving a three-dimensional diffusion equation. It is found that the

regions with reduced EBIC signals around the grain boundaries are much smaller than the bulk diffusion length. The difference between the EBIC profile and that of local cell photoresponse is pointed out and a way to estimate the latter is proposed based on the information from the EBIC profile. (Author)

A82-19879 Rapid characterization of solar cell performances. H. Takakura, T. Nishino, and Y. Hamakawa (Osaka University, Toyonaka, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 17-21. 6 refs.

A new technique of computer-assisted automated measurements and analyses for solar cell output characteristics has been developed. A curve-fitting method developed in this work permits the estimation of solar cell parameters such as the saturation current, n-value, etc. A quantitative correlation between these parameters and fabrication conditions is discussed. This automated system also enables the user to calculate the real photocurrent from output characteristics. More precise analyses of the solar cell output parameters are discussed. (Author)

A82-19880 Characterization of 3-inch solar cells fabricated from granular silicon obtained in a fluidized-bed reactor. T. Warabisako, S. Matsubara, H. Itoh, T. Saitoh, T. Tokuyama (Hitachi, Ltd., Central Research Laboratory, Kokubunji, Tokyo, Japan), K. Matsukuma (Hitachi Ltd., Hitachi Works, Hitachi, Ibaraki, Japan), and N. Hasegawa (Shin-Etsu Chemical Co., Ltd., Research and Development Laboratory, Niigata, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 23-27. 5 refs. Research supported by the Ministry of International Trade and Industry.

Industrial feasibility of a solar-grade silicon material for use in terrestrial solar cells is demonstrated through the fabrication of practical size, 3 in. diameter, solar cells. The granular silicon prepared in a fluidized-bed reactor consumes less energy than the current Siemens process. A polycrystalline ingot obtained by the Czochralski method is described as a function of ingot length in terms of electrical properties and solar cell performance. Impurity gettering is also attempted through the application of a phosphorus diffusion process. The possibility of realizing a conversion efficiency higher than 8% for an entire ingot is revealed. (Author)

A82-19881 Fabrication and properties of silicon solar cells using squarely shaped crystals. E. Kuroda, S. Matsubara, T. Saitoh, and T. Tokuyama (Hitachi, Ltd., Central Research Laboratory, Kokubunji, Tokyo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 31-37. 10 refs. Research supported by the Ministry of the International Trade and Industry.

Square single crystal silicon ingots with 3-inch sides are grown by producing uniform melt temperature distribution in the crucible. The growth of square ingots is described in a model where supercooling is present at the growth interface, and where growth rates vary for different faces. A relatively high conversion efficiency of 12-13% is obtained from square solar cells. Inhomogeneities in the solar cells are revealed by studying laser-beam induced current images and crystal defect density distribution. The packing density in modules increases up to the 0.93-0.95 level. As a result, modular efficiency also increased by 20%, compared with when using circular wafers. (Author)

A82-19883 Junction and bulk region characteristics of the laser annealed Si solar cells. A. Usami and H. Nishioka (Nagoya Institute of Technology, Nagoya, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 45-49. 7 refs.

The diffusion length in the bulk region and carrier lifetime near the junction in laser annealed Si solar cells are presented. The excess currents in the low forward bias region and the reverse currents of the laser annealed cells were observed to be larger than those in an 800 deg C furnaced annealed cell, implying the existence of residual defects near the junction in the laser prepared cells. The spectral response of the laser annealed cell was equal to that of the furnace annealed cell, while the minority carrier diffusion length in the laser annealed cells was three times that of the furnace annealed cell, which means a better response at higher wavelengths for the laser annealed crystals. Degradation in the solar cells was noted to occur when the laser pulse energy was above 1.5 J/sq cm. M.S.K.

A82-19884 Fundamental properties of MIS solar cells using Mg-p Si system. H. Matsura, S. Nishino, and H. Matsunami (Kyoto University, Kyoto, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 51-55. 8 refs.

Existence of an inversion layer at the surface of Si in an MIS diode using the Mg-p Si system is confirmed by the analysis of C(-2)V characteristics and charges in the inversion layer are estimated. The diode is thought to behave like a p-n junction diode, since minority carrier current is dominant in I-V characteristics. Effects of oxidation time on the C(-2)-V and I-V characteristics are studied. Photovoltaic properties of this inversion type MIS diode are measured. (Author)

A82-19885 A large active area Be-Si MIS solar cell with textured surface. Y. Maeda (Hoxan Corp., Research Laboratories, Sapporo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 57-60. 5 refs.

Experiments on an MIS solar cell using Be as a barrier metal are reported. A Be layer was deposited on boron doped Si wafers by a vacuum deposition technique, resulting in a layer 100-250 A thick. The resulting Be-Si MIS cell displayed an open circuit voltage of 0.5 V, short circuit current density equal to 27.3 mA/sq cm, a fill factor of 0.62, and an efficiency of 8.5%. The preparation of large active area cells is described for 4 sq cm cells, including the electron beam induced vapor deposition at a rate of 15 A/sec. Efficiencies of about 7% were obtained for several cells, with an optimum angle of incidence between 70 and 80 deg. The angular dependence was discovered to be a result of pyramidal shadowing in the deposited layer. Finally, it is noted that a double layered grid electrode consisting of the Be and aluminum contact metal was fabricated, which prevented leakage between the front contact and the textured Si surface. M.S.K.

A82-19888 Parallel- and radial-current stream-line type metal-contacts of solar cell. K. Yonei (Shibaura Institute of Technology, Tokyo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 73-76. 5 refs.

The relation of the window-side metal contact structure to loss in the transparent-conduction region of a solar cell is analytically described. It is assumed that the current is perpendicular to the boundary of the transparent-conduction region, and a basic equation is formulated to define the parallel current and radial current streamlines extending to the metal-contact structures in the back of the cell. It is shown that the larger the surface resistivity of the transparent-conduction region becomes, the larger the difference between the values of the power density of the parallel and radial current streamlines becomes. It is concluded that the chance of losing the window-side metal contact leads to a necessity of fabricating the cells into radial current streamline cells, which have a surface resistivity one order of magnitude lower than the parallel current streamline cells. M.S.K.

A82-19889 Efficiency increase of solar cells operated in dielectric liquid. T. Ugumori and M. Ikeya (Yamaguchi University, Ube, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied*

Physics, vol. 20, 1981, Supplement 20-2, p. 77-80. 6 refs.

Light collection by means of refraction and inner reflection by solar cells immersed in dielectric liquids is investigated, along with the adsorption of polarizable molecules in the liquid. Solar cells with varying p-n junction depths were used to examine the adsorption effect, and current-voltage characteristics and depletion layer capacitance were measured to ascertain the effect of the polarizable molecules. The cells were illuminated by laser light in baths of benzene, ethyl ether, acetone, ethyl alcohol, and methyl alcohol. The photocurrent increased with an increase in the wavelength of the laser light, while the voltage did not increase as quickly. The polarizable molecules are interpreted as suppressing the surface recombination, a factor which overshadows any changes due to reflection. The molecules are thought to adsorb into the antireflection coatings of the cells. M.S.K.

A82-19891 High efficiency MOS solar cells by anodic oxidation processes. H. Yamamoto, M. Moniwa, T. Sawada, and H. Hasegawa (Hokkaido University, Sapporo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 87-91. 14 refs.

Preparation of GaAs, InP and Si single-crystal MOS solar cells by anodization in various modes is investigated. Both passive and active modes of anodization are found to increase the open-circuit voltage with respect to that of the bare Schottky cell. The best result is obtained by active anodization of n-GaAs. Passive anodization with a high formation voltage results in an anomalous reduction in photocurrent. A detailed analysis of cell current-voltage characteristics indicates that cell behavior is dominated by interface-states. (Author)

A82-19893 A new structure for high efficiency and humidity resistant AlGaAs/GaAs solar cells. K. Mitsui, S. Yoshida, T. Oda, Y. Yukimoto, and K. Shirahata (Mitsubishi Electric Corp., Itami, Hyogo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 99-103. 7 refs.

A82-19894 Performance of 1 kWp AlGaAs/GaAs terrestrial concentrator solar cell array. S. Yoshida, K. Mitsui, T. Oda, Y. Yukimoto, and K. Shirahata (Mitsubishi Electric Corp., Itami, Hyogo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 105-108. 6 refs.

A 1 kWp (electrical output power at 100 mw/sq cm incident power density) concentrating photovaltaic array with 180 square Fresnel lenses and AlGaAs/GaAs concentrator solar cells has been constructed. The AlGaAs/GaAs concentrator solar cells consist of p-AlGaAs/p-GaAs/n-GaAs with an area of 2 x 2 sq cm. The p-GaAs layer thickness is set at 3-5 microns so as to keep the spreading resistance low. The concentrator cells are passively cooled by natural convection. The maximum output power from the best concentrator cell is 9.1 with an efficiency of 22.6% at about 125 suns. An array output power of 977 W has been obtained at 125 suns. (Author)

A82-19895 Photovoltaic effect in monoclinic ZnP2. K. Ito, Y. Matsuura, T. Nakazawa, and H. Takenouchi (Shinshu University, Nagno, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 109-112. 5 refs.

Heterojunction diodes consisting of n type In2O3 film and p type monoclinic ZnP2 single crystal were formed. Spectral response of monoclinic ZnP2 was measured on these diodes using polarized monochromatic light. At wavelengths around 0.76 micrometer, the response for the electric vector of plane polarized light parallel to the c-axis was considerably larger than that for the light polarized perpendicular to c. The anisotropy of the response corresponds to an intense dichroism observed in the absorption spectrum of monoclinic ZnP2. The overall response observed within the 0.35-0.86 micrometer range matches with the solar spectrum. (Author)

A82-19896 Growth and evaluation of n-CdS/n-InP/p-InP heteroface solar cell. A. Yoshikawa, S. Yamaga, and H. Kasai (Chiba University, Chiba, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 113-117. 15 refs.

Fabrication and electrical and optical characteristics of an n-CdS/n-InP/p-InP heteroface solar cell are described. The cell was fabricated by two growth steps, i.e., first, a thin n-InP layer was grown on a p-InP substrate by a conventional LPE technique, then a thin n-CdS layer was grown on the n-InP layer by the close-spaced technique. It is shown that the photoresponse of an n-InP/p-InP homojunction cell is remarkably improved by applying a CdS layer on the n-InP because the surface recombination velocity on the n-InP reduces after a CdS growth. Furthermore, the reverse saturation current and the built-in voltage of the InP homojunction are also improved after a CdS growth. The conversion efficiency of the heteroface solar cell with no AR coating was 10.4% under AM2 conditions. The lower observed efficiency than that expected theoretically is attributed to a poor electrical characteristic of the n-InP/p-InP homojunction. (Author)

A82-19897 InGaAsP/InP wavelength division solar cells. N. Ito, S. Hattori (Nagoya University, Nagoya, Japan), T. Uesugi, S. Sakai, and M. Umeno (Nagoya Institute of Technology, Nagoya, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 121-125. 9 refs.

Two types of InGaAsP/InP wavelength division solar cells are fabricated. One of them includes a shallow homojunction and the other has a heteroface structure. A combination of the present cell and a conventional high efficiency GaAlAs/GaAs cell is proposed in this paper. The fabricated first type of cell exhibited a conversion efficiency of 11% for total solar illumination and 18.5% for filtered illumination with GaAs crystal. Neglecting the optical loss in filter material, the possibility that a 26% conversion efficiency will be obtained in the proposed system is demonstrated. The initial results on the second type of cell are presented and an 8.71% conversion efficiency was obtained with a single p-n junction InGaAsP/InP heteroface solar cell. (Author)

A82-19898 Design and performances of a triple /GaAs, Si, and Ge/- solar-cell system with multi-layered spectrum splitters. H. Sakaki, T. Tanoue, K. Yokoyama, Y. Sekiguchi (Tokyo, University, Tokyo, Japan), D. C. Sun (Mitsubishi Electric Corp., Itami, Hyogo, Japan), and Y. Yukimoto. *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 127-133. 6 refs.

A calculation has been performed to predict the ultimate conversion efficiency of various split-spectrum multiple-solar cell systems. Based on this analysis, a triple-cell system is designed and fabricated in which the solar radiation is divided by multilayered filters into three beams of different spectral bands; the beams are then converted separately by a GaAs-, an Si-, and a Ge-cell. A total conversion efficiency of 22.7% is achieved. The factors determining the efficiency are examined to clarify possible methods of attaining higher efficiencies. (Author)

A82-19902 Effect of fluorine on the photovoltaic properties of amorphous silicon prepared by dc glow discharge. K. Nishihata, M. Konagai, K. Takahashi (Tokyo Institute of Technology, Tokyo, Japan), and K. Komori (Showa Oil Co., Tokyo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 151-155. 14 refs. Research supported by the Ministry of International Trade and Industry.

Amorphous Si-F-H films were prepared by dc glow discharge in an atmosphere of SiF4 + H2. The electrical and optical properties have been described. Infrared spectra of amorphous Si-F-H have been studied for various deposition pressures. In the n-type doping characteristics, the maximum conductivity obtained is 10.0/ohm-cm

with the addition of 500 vppm PH3. The Schottky barrier a-Si-F-H solar cell shows an efficiency of 3.5% under AM1, 100 mW/sq cm insolation. (Author)

A82-19903 Properties of amorphous Si:F:H film and its photovoltaic characteristics. Y. Kuwano, M. Ohnishi, H. Nishiwaki, S. Tsuda, and H. Shibuya (Sanyo Electric Co., Ltd., Research Center, Hirakata, Osaka, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 157-162. 9 refs. Research supported by the Ministry of International Trade and Industry.

The optical and electrical characteristics of a-Si:F:H films deposited by RF glow discharge and the photovoltaic properties of the a-Si cells using the films are discussed, in addition to the presentation of a new phenomenon in a-Si solar cells. Glow discharge deposition of a-Si:H and a-Si:F:H films in SiH4 and SiF4 + SiH4, respectively, were accomplished by an RF capacitive system at a pressure of 0.4 Torr. Glass/ITO/p-i-n cells were also fabricated with a boron doped p-layer of about 50-800 A, an undoped layer of 1000-20,000 A, and a phosphorus doped n-layer 100-1500 A thick on an ITO transparent film deposited on glass. Investigation of the properties of the a-Si:F:H films in terms of IR transmittance revealed a peak at 830/cm, implying that the deposited film contains fluorine. A decrease in efficiency with an increase in light intensity was observed to be less than that which occurs in a-Si:H cells. M.S.K.

A82-19905 Dependence of RF power on the content and configuration of hydrogen in amorphous hydrogenated silicon by reactive sputtering. T. Imura, K. Ushita, K. Mogi, and A. Hiraki (Osaka University, Suita, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 171-174. 10 refs.

Infrared absorption spectra at stretching bands of Si-H were investigated in hydrogenated amorphous silicon fabricated by reactive sputtering in the atmosphere of Ar and H2 (10 mole%) at various input RF powers in the range from 0.8 to 3.8 W/sq cm. Hydrogen content mainly due to the configuration of Si = H2 in the film increased with the decreasing RF power, as the deposition rate was decreased. On the other hand, the quantity of the monohydride (Si-H) configuration depended less on the power. Attachment of hydrogen molecules onto the fresh and reactive surface of silicon deposited successively was proposed for possible process of hydrogen inclusion into amorphous silicon resulting in Si = H2 configuration. The photoconductivity increased as the input power became higher, when the deposition rate also increased linearly with the power. (Author)

A82-19909 Interpretation of characteristics in a-Si:H solar cells. Y. Uchida, H. Sakai, and M. Nishiura (Fuji Electric Corporate Research and Development, Ltd., Yokosuka, Kanagawa, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 191-194. 12 refs. Research supported by the Ministry of International Trade and Industry.

Current versus voltage characteristics in an illuminated a-Si:H solar cell which shows conversion efficiency of 4.3% (cell area of 1.0 sq cm) are interpreted by assuming a simplified junction model and a distribution of the density of states in the band gap. Since the width of the depletion region relates to this distribution, a depletion width (W) versus bias voltage (V) relation can be calculated from this distribution. Also, another W-V relation is obtained from light-generated current data on the basis of a few assumptions. These two different estimations of the W-V relation excellently agree when one assumes a hyperbolic distribution of the density of states in the band gap which is symmetric with respect to the middle of the energy band gap and has a density of mid-gap states of 8.3 x 10 to the 15th per cu cm eV. This values are comparable to the minimum density of states in a-Si:F:H reported by Czubatyj et al. (1980). (Author)

A82-19911 Schottky barrier solar cells of weakly hydrogenated CVD amorphous silicon. T. Nakashita, M. Hirose, and Y. Osaka (Hiroshima University, Hiroshima, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 201-204. 9 refs.

Electronic properties of CVD a-Si were remarkably improved by hydrogen plasma annealing. As a result, the Schottky-barrier solar cells without an antireflection coating have provided a conversion efficiency of 2.7% at 100 mW/sq cm, and no Staebler-Wronski effect has been observed in the hydrogenated CVD a-Si cell. It is also found that the fill factor is dependent on incident light intensity, because of changes in its series and parallel resistances by light illumination. (Author)

A82-19912 Characteristics of Schottky barrier diodes in reactively sputtered amorphous Si:H. H. Okushi, K. Nakagawa, H. Yamamoto, A. Matsuda, K. Tanaka, S. Iizima (Ministry of International Trade and Industry, Electrotechnical Laboratory, Sakura, Ibaraki, Japan), S. Yamasaki, and M. Matsumura (TOA Nenryo Kogyo KK, Tokyo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 205-209. 6 refs.

Experiments with Schottky barrier diodes in reactivity sputtered a-Si:H films to investigate the diode characteristics on the basis of film properties are reported. The H content, optical gap, activation energy, spin density, and diode characteristics such as I-V, C-V, and photovoltaic properties are discussed in terms of the bonded H-content. The samples were prepared in a diode sputtering system and the H2 content was varied, with the Schottky diodes in an n+ crystalline Si configuration having Au contacts. The bonded H and median wave number were determined by film thickness and IR absorption spectroscopy. The effective density of gap states was found to decrease with increasing H content, and discussions are presented of the transient current characteristics and the illuminated diode characteristics. M.S.K.

A82-19913 A new integrated type amorphous Si solar cell. Y. Kuwano, S. Tsuda, M. Ohnishi, H. Nishiwaki, H. Shibuya, S. Nakano, and T. Imai (Sanyo Electric Co., Ltd., Research Center, Hirakata, Osaka, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 213-218. 7 refs. Research supported by the Ministry of International Trade and Industry.

The conversion efficiencies of amorphous silicon (a-Si) solar cells were found to decrease with an increase of the cell size. The cause of this effect was investigated, and a part of the cause was indicated by a distributed constant model. In order to enlarge the size of a solar cell with high efficiency, an integrated structure has been developed for the a-Si solar cell module. The best conversion efficiency of this module with a size of 10 x 10 sq cm was 3.4% in sunlight. (Author)

A82-19914 Optimizations of the film deposition parameters for the hydrogenated amorphous silicon solar cell. Y. Tawada, T. Yamaguchi, S. Nonomura, H. Okamoto, Y. Hamakawa (Osaka University, Toyonaka, Japan), and S. Hotta. *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 219-225. 12 refs.

A82-19915 Broadening of spectral response width by a-Si/a-SiGe p-i-n type solar cells. G. Nakamura, K. Sato, Y. Yukimoto, and K. Shirahata (Mitsubishi Electric Corp., LSI Research and Development Laboratory, Itami, Hyogo, Japan). *(Japan Society of Applied Physics and Science Council of Japan, Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, Dec. 2-4, 1980.) Japanese Journal of Applied Physics*, vol. 20, 1981, Supplement 20-2, p. 227-232. 11 refs. Research supported by the Ministry of International Trade and Industry.

A82-19948 Turbomachinery for small solar power plants. K. Bammert (Hannover, Universität, Hanover, West Germany), H. Helkal (Helwan University, Cairo, Egypt), and A. Mobarak (Cairo University, Cairo, Egypt). *Forschung im Ingenieurwesen*, vol. 47, no. 6, 1981, p. 169-178. 5 refs.

The considered investigation is concerned with the selection of turbomachinery for a thermodynamic cycle involving the employment of working fluids at different maximum process temperatures, taking into account the power range from 10 to 500 kW. Approaches for determining system efficiency are discussed. It is pointed out that in selecting the thermodynamic cycle and the working fluid for a solar power plant, the primary consideration must be related to the necessity to obtain a simple, reliable system which meets also the efficiency requirements. The Rankine cycle and the Brayton cycle are described, and the design of suitable turbines and compressors is considered. It is found that solar farm plants using parabolic troughs or bowls are best suited for process temperatures in the range from 200 to 300 C and for power outputs up to 500 kW. For the considered conditions, steam and toluene are the most suitable working fluids in a Rankine system. G.R.

A82-20066 Macroscopic surface roughness in metal-dielectric composite films - Photothermal absorber applications. G. A. Nyberg and R. A. Buhrman (Cornell University, Ithaca, NY). *Applied Physics Letters*, vol. 40, Jan. 15, 1982, p. 129-131. 9 refs. NSF-supported research; Contract No. DE-FG02-80CS-83113.

Previous studies have shown that coevaporated metal-dielectric composite films are quite smooth. But a substantially higher deposition temperature results in the surface roughness of Mo/Al2O3 composite films becoming larger than the mean film thickness. This effect was applied to photothermal solar absorbers where, for the first time, a stable selective absorber was produced which absorbs over 99% of the solar spectrum. These results have implications for other surface roughness dependent effects. (Author)

A82-20070 Silicon-silicon interfaces. D. Redfield (RCA Laboratories, Princeton, NJ). *Applied Physics Letters*, vol. 40, Jan. 15, 1982, p. 163-165. 14 refs. Research supported by RCA; Contract No. DE-AC01-79ET-23108.

A wide variety of measurements on silicon grain boundaries shows that the electronic properties of such boundaries are much like those of Si surfaces in all essential respects. Moreover, the properties of 'clean' surfaces and lightly contaminated surfaces can be studied on many crystallographic orientations of the interfaces without the need for vacuum measurements. Such grain boundaries may therefore be regarded as Si-Si interfaces in the sense used in surface physics. It is shown that the thermal history and the dissolved oxygen of the silicon play major roles in determining the interface properties. (Author)

A82-20136 * Solar/hydrogen systems for the 1985-2000 time frame - A review and assessment. J. A. Hanson (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA), R. W. Foster, W. J. D. Escher, and R. R. Tison (Escher-Foster Technology Associates, Inc., St. Johns, MI). *International Journal of Hydrogen Energy*, vol. 7, no. 1, 1982, p. 3-20. Research sponsored by the U.S. Department of Energy and NASA.

A comprehensive state-of-the-art review of solar/hydrogen technologies has been conducted. From this, solar/hydrogen production systems which could be commercialized by the year 2000 have been characterized technically and economically. Incentives and disincentives for the early commercialization of four solar/hydrogen systems have been explored, conclusions drawn and recommendations made. (Author)

A82-20139 * Urban air pollution and solar energy. R. B. Gammon (New South Wales, Energy Authority, Sydney, Australia), J. R. Huning, M. S. Reid, and J. H. Smith (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *International Journal of Ambient Energy*, vol. 2, Oct. 1981, p. 183-195. 49 refs. Contract No. NAS7-100.

The design and performance of solar energy systems for many potential applications (industrial/residential heat, electricity generation by solar concentration and photovoltaics) will be critically affected by local insolation conditions. The effects of urban air pollution are considered and reviewed. A study of insolation data for Alhambra, California (9 km south of Pasadena) shows that, during a recent second-stage photochemical smog alert (greater than or equal to 0.35 ppm ozone), the direct-beam insolation at solar noon was reduced by 40%, and the total global by 15%, from clean air values. Similar effects have been observed in Pasadena, and are attributable primarily to air pollution. Effects due to advecting smog have been detected 200 km away, in the Mojave Desert. Preliminary performance and economic simulations of solar thermal and photovoltaic power systems indicate increasing nonlinear sensitivity of life cycle plant cost to reductions in insolation levels due to pollution. (Author)

A82-20165 SHAC - A nation turns to the sun. N. Lihach. *EPRI Journal*, vol. 6, Dec. 1981, p. 13-17.

The state-of-the-art and applications of solar heating and cooling are discussed. Domestic hot water heating is considered as a currently viable, commercially acceptable technique, with progress moving rapidly in the area of building heat. Storage systems, when combined with solar heating systems, are asserted to be a valid method of levelling off utility heating energy supply loads, and studies by the Electric Power Research Institute to identify site specific active solar systems are outlined. The insulation of storage tanks has been found to be a critical factor in solar system economics, with single tank storage being more efficient than multiple tank methods; careful management of the stored hot water use extended a system's effectiveness. Other findings showed that hot air collectors gathered more thermal energy than liquid filled collectors, liquid storage is more efficient than rock storage, and passive systems are most likely to be used on new houses. M.S.K.

A82-20167 Solar-thermal electric - Focal point for the desert sun. D. Van Atta. *EPRI Journal*, vol. 6, Dec. 1981, p. 37-41, 43. 6 refs.

The applications of solar thermal systems are explored, including flat plate and line-focus collectors, and parabolic and heliostat point focus electrical generators. The first U.S. 10MWe solar tower power plant, Solar One, is due to begin operational testing in 1982, while five other projects are under way in Europe and Japan. Mention is made of the use of solar thermal generators as repowering plants, used to preheat steam for conventional gas and oil fueled power plants. Thermal storage methods, such as molten salt, hot rocks, and hot oil are reviewed, as are Brayton and Rankine cycle heat transfer systems. The Brayton cycle will be tested in a hybrid scheme with a fossil fuel burning gas generator which will supplement the output from the solar thermal section. M.S.K.

A82-20168 Photovoltaics - A question of efficiency. R. Whitaker. *EPRI Journal*, vol. 6, Dec. 1981, p. 45-51. 11 refs.

The current state and requirements for large scale use of photovoltaic cells are examined. Annual sales are presently 4 MW, going primarily to remote communications installations, railway controls, navigation aids, and communications equipment on offshore oil platforms. With a goal of mass-production of cells yielding power at 0.70 cents/W, research programs are investigating crystalline Si, thin film CdS cells, amorphous Si films, etc. Cell module losses include defective cells, faulty wiring, uneven production quality, and losses in efficiency at higher temperatures. Higher efficiencies using cheaper cells are being investigated by doping amorphous cells with hydrogen, by laser recrystallization of thin film surfaces, or by employing more expensive cells in concentrator configurations. Utility applications are examined, noting that the ultimate goal is for modular units for home use. M.S.K.

A82-20169 Sea, soil, sky - Testing solar's limits. J. Hopkinson. *EPRI Journal*, vol. 6, Dec. 1981, p. 55-61. 6 refs.

The potentials and actualities of large scale biomass, ocean thermal, and satellite solar power systems are discussed. Biomass is an energy already on-line in installations ranging from home-sized wood-burning stoves to utility sized generators fueled by sawdust and forest residue. Uses of wheat straw, fast-growing trees such as eucalyptus and alder, and euphorbia as biofuels are examined, noting restrictions imposed by land use limitations and the necessity for genetic engineering for more suitable plants. Pyrolysis and thermochemical gasification of biomass to form gaseous, solid, and liquid

fuels are explored, and mention is made of utility refuse and sewage incineration for power generation. OTEC, satellite solar power systems, and tidal generator plants are considered as promising for further investigation and perhaps useful in limited applications, while solar pond power plants require extremely large areas to be effective. M.S.K.

A82-20205 Fabrication of thick narrow electrodes on concentrator solar cells. A. Blakers, P. B. Kosel, M. R. Willison, and M. A. Green (New South Wales, University, Kensington, Australia). *Journal of Vacuum Science and Technology*, vol. 20, Jan. 1982, p. 13-15. 5 refs. Research supported by the National Energy Research Development and Demonstration Council.

Narrow electrodes of thickness greater than 15 microns have been fabricated on concentrator solar cells by the PMTP (photoresist-metal-thick photoresist) process. This technique provides grid lines of low series resistance while minimizing the active area of silicon covered by electrodes, both advantages which increase the conversion efficiency of concentrator solar cells. In addition, as this technique is a 'liftoff' technique, it allows the use of composite or alloy metals which normally suffer in the course of chemical etching. Finally, the thick photoresist layer smooths out short range surface roughness and allows this technique to be used equally effectively on polycrystalline, textured or amorphous surfaces. (Author)

A82-20457 * Photovoltaic investigation of minority carrier lifetime in the heavily-doped emitter layer of silicon junction solar cell. C.-T. Ho (Mobil Tyco Solar Energy Corp., Waltham, MA). *Journal of Applied Physics*, vol. 53, Jan. 1982, p. 507-513. 21 refs. Research supported by the U.S. Department of Energy; Contracts No. NAS7-100; No. JPL-954355.

The results of experiments on the recombination lifetime in a phosphorus diffused N(+) layer of a silicon solar cell are reported. The cells studied comprised three groups of Czochralski grown crystals: boron doped to one ohm-cm, boron doped to 6 ohm-cm, and aluminum doped to one ohm-cm, all with a shunt resistance exceeding 500 kilo-ohms. The characteristic bulk diffusion length of a cell sample was determined from the short circuit current response to light at a wavelength of one micron. The recombination rates were obtained by measurement of the open circuit voltage as a function of the photogeneration rate. The recombination rate was found to be dependent on the photoinjection level, and is positive-field controlled at low photoinjection, positive-field influence Auger recombination at a medium photoinjection level, and negative-field controlled Auger recombination at a high photoinjection level. M.S.K.

A82-20463 Some properties of dc glow discharge amorphous silicon solar cells. H. Wiesmann, C. Coleman (Plasma Physics Corp., Locust Valley, NY), and A. Ghosh (Brookhaven National Laboratory, Upton, NY). *Journal of Applied Physics*, vol. 53, Jan. 1982, p. 703-707. 22 refs. Contract No. DE-AC02-76CH-00016.

A study of the internal yield, depletion width and absorption constant is presented for dc glow discharge P-I-N amorphous silicon films. Internal yields of approximately 0.9 at 475 nm and depletion widths as large as 0.37 microns were observed at low illumination levels and were characteristic of the better cells. The absorption constant as a function of wavelength showed no anomalies and was comparable to RF glow discharge films with an optical gap of 1.68 eV. A unique aspect of these cells is that the top P layer is amorphous boron. (Author)

A82-20464 Improved efficiency of n-CdSe thin-film photoelectrodes by zinc surface treatment. J. Reichman and M. A. Russak (Grumman Aerospace Corp., Research Dept., Bethpage, NY). *Journal of Applied Physics*, vol. 53, Jan. 1982, p. 709-711. 15 refs. Contract No. XP9-8002-8.

The open circuit voltage, fill factor, and power conversion efficiency of n-CdSe thin-film electrodes for photoelectrochemical solar cells have been improved by treating the surface with Zn(+2) ions. The overall efficiency of these electrodes was increased from approximately 5% to as high as 6.5% with a soaking treatment in 1 M ZnCl2. Photoelectrochemical measurement and Auger spectroscopy indicated the observed improvements were the result of a shift in the flat-band potential to more negative values to the incorporation of zinc into the surface region of the CdSe thin film. (Author)

A82-20574 The silicon solar satellite power system - A net energy analysis. B. Hannon and J. P. Naughton (Illinois, University, Urbana, IL). *Energy Systems and Policy*, vol. 5, no. 4, 1981, p. 319-343. 17 refs. Research supported by the National Academy of Sciences.

The physical aspects and net energy balance of a Satellite Solar Power System (SSPS) are examined. The feasibility of operating with or without laser annealing for the cells, possible variations in the total system costs, the projected worth of the energy, and the R&D costs are explored. The energy needed to mine, refine, fabricate, manufacture, launch, and maintain the SSPS materials and structures are included in the energy analysis, and cost-to-energy ratio of energy used to energy produced graphs are provided for the cases of the use or non-use of laser annealing for radiation protection for the solar cells. The resulting energy ratios indicate that the reference SSPS compares unfavorably with coal or nuclear earth-based plants, although further research is necessary to determine what level of technology is actually required for construction of the SSPS. M.S.K.

A82-20642 * # Cost and sizing sensitivities for the solar power satellite. L. Monford, G. D. Arndt, and J. W. Seyl (NASA, Johnson Space Center, Houston, TX). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 48.3.1-48.3.5.

A summary is provided of the characteristics and error parameters of the reference microwave transmission system for the solar power satellite (SPS). The relative importance of electrical and mechanical tolerances upon scattered microwave power and electrical costs is investigated. It is found that small increases in efficiency and/or reduction of losses (less than one percent) can improve the revenue from a single satellite over its 30-year lifetime by several hundred million dollars. Attention is given to a system definition, cost sensitivities for the reference system, the klystron dc-RF conversion efficiency, the transmitting antenna, the rectenna collection efficiency, system sizing tradeoffs, a cost analysis, and multiple antennas. G.R.

A82-20708 * # Solid-state alternatives for the Solar Power Satellite. L. Leopold and G. D. Arndt (NASA, Johnson Space Center, Houston, TX). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 72.1.1-72.1.5.

A solid-state transmitter at S-band frequencies will allow many low-power antenna array elements fed directly by the solid-state amplifier modules to combine power for transmission to earth in space. Two configurations, one the separate antenna and the other a sandwich concept are discussed. The results of two small hardware development studies are presented. (Author)

A82-20722 A high efficiency single-crystal CdSe photoelectrochemical solar cell and an associated loss mechanism. K. W. Frese, Jr. (SRI International, Menlo Park, CA). *Applied Physics Letters*, vol. 40, Feb. 1, 1982, p. 275-277. 13 refs.

The properties of n-CdSe photoelectrochemical solar cells using aqueous alkaline K3Fe(CN)6/K4Fe(CN)6 as the redox couple are examined. Such cells are shown to have a peak conversion efficiency of 12.4% at 13 mA/sq cm and 0.85V, when a solution with pH 13.4 is used. The pH of the solution is found to be very important for obtaining high-efficiency cells. Cell degradation due to selenium corrosion is discussed in terms of a simple model where the dominant degradation mechanism is attributed to light absorption by Se. V.L.

A82-20881 Technological approach towards future large solar arrays. B. Georgens (Telefunken AG, Wedel, West Germany). In: Space in the 1980's and beyond; Proceedings of the Seventeenth European Space Symposium, London, England, June 4-6, 1980. San Diego, CA, American Astronautical Society; Univelt, Inc., 1981, p. 229-250. 5 refs. (AAS 80-323)

Three generations of solar arrays are described, the first being characterized by body mounted arrays, the second by rigid paddle arrays, and the third by the direct bonding of solar cells on thin,

flexible plastic foils. It is pointed out that the use of solar arrays as power sources could significantly increase the capabilities of the Shuttle and Spacelab. Since the capacity for manufacturing solar cells in Europe has been increased to the required level, attention must now be directed to increasing cell efficiency and decreasing cell thickness toward 100 microns. Detailed development is also required in order to meet the retractability and high-voltage requirements in blanket technology. C.R.

A82-20968 Coupling to solar energy: Sensitized photoreactions - The primary source of self-organization. P. Decker (Hannover, Tierärztliche Hochschule, Hanover, West Germany). In: Origin of life; Proceedings of the Third ISSOL Meeting and Sixth ICOL Meeting, Jerusalem, Israel, June 22-27, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 529-536. 31 refs.

Life is modelled as a thermodynamically dissipative mechanism, and the chemical reactions most amenable to the formation of 'bioids' which form and change from one generation to the next are examined. The self-organization is assumed to occur on a planetary surface exposed to 6000 deg light quanta, in the availability of reactive chemicals, with nonenzymatic catalysts being present, and with macromolecules able to mediate the reactivity through catalytic concentration of metal ions. The model is taken to indicate that experimentation should look for photochemical reactions with autocatalytic feedback which yield an organization into cycles in a steady state scenario. The oxidation of methane is mentioned for the production of formaldehyde and the autocatalytic formation of sugars from the formaldehyde, and experiments on a nonenzymatic photophosphorylation is described as an example of the synthesis of energy rich intermediates. M.S.K.

A82-21147 Silicon solar cells with reduced temperature sensitivity. M. A. Green (Solar Energy Research Institute, Golden, CO.; New South Wales, University, Kensington, Australia), K. Emery (Solar Energy Research Institute, Golden, CO), and A. W. Blakers (New South Wales, University, Kensington, Australia). *Electronics Letters*, vol. 18, Jan. 21, 1982, p. 97, 98. 6 refs. Research supported by the Solar Energy Research Institute and Australian National Energy Research Development and Demonstration Council.

As the open-circuit voltage of silicon solar cells continues to improve, one resulting advantage, not widely appreciated, is reduced temperature sensitivity of device performance. Recently a new type of silicon solar cell has been described which has resulted in a significant increase in open circuit voltage. Experimental results are described for these devices which demonstrate the lowest temperature sensitivity ever reported for silicon cells under unconcentrated sunlight. With further improvements in voltage, it should be possible to approach the relative temperature insensitivity of some high performance GaAs devices. (Author)

A82-21149 A comparison of the solar-gas and solar-electric interface. G. G. Mannella (Mechanical Technology, Inc., Latham, NY). *Energy* (UK), vol. 7, Jan. 1982, p. 31-37. 15 refs.

The introduction of large-scale solar-derived gas, electricity, and home heat into the national pipeline, electric grid, and fuel supply systems is discussed. Natural gas is shown to be substitutable for most other energy sources, having a lower cost per energy unit than electricity or oil, and able to be augmented by biomass derived methane or solar derived hydrogen. The latter is perceived as an unproven technology, both economically and technically. Solar home heating systems will lower the utilities' rate base and lead to minimum charge rates for solar customers and higher rates for regular customers unless utilities are permitted to enter the solar heating business as an extension of their role as a service institution. Dispersed solar electric systems are seen to be the least economical use of solar systems, while the solar-gas system offers the greatest potential as a bridge for solar technologies into residential, institutional, and commercial markets. M.S.K.

A82-21150 Solar energy/utility interface - The technical issues. R. D. Tabors and D. C. White (MIT, Cambridge, MA). *Energy* (UK), vol. 7, Jan. 1982, p. 39-48. 10 refs.

The technical and economic factors affecting an interface between solar/wind power sources and utilities are examined. Photovoltaic, solar thermal, and wind powered systems are subject to stochastic local climatic variations and as such may require full back-up services from utilities, which are then in a position of having reserve generating power and power lines and equipment which are used only part time. The low reliability which has degraded some economies of scale formerly associated with large, centralized power plants, and the lowered rate of the increase in electricity usage is taken to commend the inclusion of power sources with a modular nature such as is available from solar derived electrical generation. Technical issues for maintaining the quality of grid power and also effectively metering purchased and supplied back-up power as part of a homeostatic system of energy control are discussed. It is concluded that economic considerations, rather than technical issues, bear the most difficulty in integrating solar technologies into the utility network. M.S.K.

A82-21253 Use of photovoltage for electrodeposition in solar cell processing technology. V. K. Jain (Solid State Physics Laboratory, Delhi, India) and A. R. Kulshreshtha (Indian Space Research Organization, Satellite Centre, Bangalore, India). *Journal of Physics D - Applied Physics*, vol. 14, Dec. 14, 1981, p. 2327-2331. 6 refs.

This paper reports the development of a new technology for the electrolytic deposition of a metal on a solar cell, without employing an external electric bias field, but by using the internal photo-induced voltage of the solar cell itself. The experimental details of depositing silver over the existing metallized contact structure of the cell and a transparent conducting oxide coating over the entire solar cell front surface are discussed. The proposed technique reduces the consumption of the processing materials and makes the fabrication procedure less expensive and simpler. (Author)

A82-21363 Bandpass filters for thermophotovoltaic conversion systems. F. Demichelis, E. Minetti-Mezzetti, M. Agnello, and V. Perotto (Torino, Politecnico, Turin, Italy). *Solar Cells*, vol. 5, Jan. 1982, p. 135-141. 9 refs. Research supported by the Fiat Aviazione S.p.A.

The design of dielectric-metal-dielectric filters especially suitable for use as wide bandpass filters with a high visible and a low IR transmittance is described. A refining method is applied to optimize the transmittance in the part of the spectrum corresponding to the spectral response of the solar cells and at the same time to preserve a high reflectance at longer wavelengths. These filters can provide a considerable transmittance over a wide band of the spectrum with a very low transmittance in the rejection regions. (Author)

A82-21364 Effect of the back-surface field on the open-circuit voltages of p/+/-n-n/+/ and n/+/-p-p/+/ silicon solar cells. S. N. Singh and G. C. Jain (National Physical Laboratory of India, New Delhi, India). *Solar Cells*, vol. 5, Jan. 1982, p. 143-172. 30 refs.

The means by which a back surface field (BSF) improves the open-circuit voltage for solar cells are investigated analytically. Minority carrier blocking, back reflection, and back-contact recombination velocity are discussed, and the effect of a BSF on cell performance is evaluated by defining an effective recombination velocity of minority carriers at the L-H junction end of the bulk region. Low and high energy level conditions in the bulk region are determined, and whereas at low levels the increase is due to the back reflection of minority carriers, at high levels the contribution of minority carrier blocking becomes significant too. The analysis is valid for front-illuminated silicon solar cells if both front and back junctions are shallow. M.S.K.

A82-21365 Optimum operating conditions of a solar cell panel and prediction of solar radiation in Sana'a, Yemen. A. Khogali and M. R. I. Ramadan (Sana'a University, Sana'a, Yemen). *Solar Cells*, vol. 5, Jan. 1982, p. 173-181. 9 refs.

Results of a study of the performance of solar cells under nominal operating conditions in Yemen are reported. The solar cell panel comprised 14 Si cells of .003 sq m surface area each, and was mounted on a rooftop with the solar radiation being measured by a pyranometer. Further monitoring was performed of the panel surface temperature, the ambient air temperature, and potentiometer readings of the panel output. Current-voltage characteristics were recorded at 14 intensities during the day for references to determine

other operating parameters. Efficiency varied as an inverse of the internal cell temperature, ranging from 21.7-17.5% at temperatures of 19 and 28.5 C, respectively. An average of daily irradiation of 21.2 MJ/sq m was calculated for 8.9 hr of sunlight/day and an increase of 10% in output was achieved in the winter by tilting the panel toward the equator. M.S.K.

A82-21366 Effect of shunt resistance and bypass diodes on the shadow tolerance of solar cell modules. M. S. Swaleh and M. A. Green (New South Wales, University, Kensington, Australia). *Solar Cells*, vol. 5, Jan. 1982, p. 183-198. 7 refs.

In the field, solar cell arrays are subjected to shadows from both predictable sources and such unpredictable sources as bird droppings or fallen leaves. The most obvious result of a shadow is a decrease in power output from the solar cell array. However, a more serious problem that can arise is the degradation and eventual failure of the array due to localized overheating. These difficulties can be avoided either by incorporating a relatively small shunt resistance in the solar cell design or by incorporating bypass diodes. In this paper we analyse these techniques and compare their effectiveness. (Author)

A82-21838 The effect of the I sub 01/I sub 02 ratio on the open circuit voltage of solar cells. A. Prasad (Bharat Electronics, Ltd., Bangalore, India). *Solid-State Electronics*, vol. 25, Jan. 1982, p. 80-82.

The relationship between the open-circuit voltage of a solar cell and the value of the ratio I sub 01/I sub 02 is investigated, I sub 01 and I sub 02 being the two leakage currents used is describing the dark characteristics of a solar cell by the two-exponential model. The voltage is found to decrease as the ratio becomes smaller. This reduction in voltage, however, is more pronounced for higher values of I sub 01. The reduction is also found to depend on the mode of variation of the space charge recombination current with applied voltage. C.R.

A82-21949 High-efficiency electrodeposited cadmium telluride solar cells. G. Fulop, M. Doty, P. Meyers, J. Betz, and C. H. Liu (Ametek, Inc., Harleysville, PA). *Applied Physics Letters*, vol. 40, Feb. 15, 1982, p. 327, 328. 10 refs.

Thin-film CdTe Schottky-barrier solar cells with efficiencies in excess of 8% have been produced by electrodeposition from an aqueous solution. The most efficient Au/CdTe solar cell developed to date had an efficiency of 8.65% (under 100 mW/sq cm illumination), and open-circuit voltage of 0.723 V, a short-circuit current density of 18.7 mA/sq cm, and a fill factor of 0.64. Even higher values of these parameters have been obtained individually on other cells. The maximum values measured to date are a short-circuit current of 21.3 mA/sq cm, an open-circuit voltage of 739 mV, and a fill factor of 0.69. V.L.

A82-22040 # Design and construction of a concentrating photovoltaic total energy system in Hawaii. D. Rafinejad and R. Spencer (Acurex Corp., Mountain View, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0069.* 8 p.

Design and construction of Hawaii's largest solar energy system are described. The project was sponsored by the U.S. Department of Energy and the State of Hawaii and was designed and constructed by Acurex Corporation. The system generates 35 kW of DC power at 1,000 W/sqm insolation. The major subsystems are the collector field, thermal energy subsystem, and electrical power generation. The photovoltaic (PV) collector field consists of 4,800 sq ft of parabolic linear focus concentrators. The linear receiver is populated with PV cells and is actively cooled. Project construction is complete and the system is currently being commissioned. (Author)

A82-22190 Effect of absorbed water on an indium oxide-insulator /BeO.SiO2/-p-silicon solar cell. K. Ito and T. Nakazawa (Shinshu University, Nagano, Japan). *Journal of Applied Physics*, vol. 53, Feb. 1982, p. 1110-1114. 30 refs.

Results are presented of a study of the output characteristics of an In2O3/p-Si heterojunction solar cell with an insulating layer of beryllium-treated silicon oxide applied between the indium oxide and the silicon. The cell was fabricated on single crystalline p-type silicon wafers thermally oxidized in O2 by the vacuum evaporation of beryllium and the deposition of indium oxide films. Results of reflection electron diffraction, Auger electron spectroscopy and observations of the beryllium thickness dependence of the heterojunction dark forward currents support the nature of the evaporated beryllium as an insulating oxide. Current-voltage curves of cells under illumination reveal increases in short-circuit current density, fill factor and open-circuit voltage with operating time, which correspond to increases in conversion efficiency from 1.1 to 9.7% in 2800 min. Experiments in which the cell was exposed to flows of various gases reveal this effect to be due to the absorption of water vapor, which introduces traps which assist electron tunneling through the composite oxide layer. A.L.W.

A82-22191 Laser processing for high-efficiency Si solar cells. R. T. Young and R. F. Wood (Oak Ridge National Laboratory, Oak Ridge, TN). *Journal of Applied Physics*, vol. 53, Feb. 1982, p. 1178-1189. 30 refs. Contract No. W-7405-eng-26.

Experiments on the optimal conditions for the laser-annealing of ion-implanted silicon solar cells to obtain cells of high efficiency are presented. Measurements of emitter region electrical characteristics, emitter dopant profiles, junction characteristics and back surface fields at various implantation energies and doses, laser energy densities, and substrate temperatures reveal the highest efficiency p(+)n and p(+)nn(+) cells to be obtained by shallow implantation (5 keV) with high surface concentrations followed by annealing with 1.2 J/sq cm laser pulses with beam homogenization. Substrate heating is also observed to improve the open-circuit voltage. It is also found that efficiencies of over 16% AM1 may be obtained with the use of laser gettering to enhance the minority carrier diffusion length and laser-induced diffusion to incorporate back surface fields in combination with ion implantation and laser annealing. A.L.W.

A82-22230 † Thermoelectric film receivers of radiant energy (Termoelektricheskie plenochnye priemniki luchistoi energii). S. Iazliev (Turkmenskii Gosudarstvennyi Universitet, Ashkhabad, Turkmen SSR). *Akademiia Nauk Turkmenskoi SSR, Izvestiia, Seriia Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk*, no. 6, 1981, p. 33-36. In Russian.

It is noted that, since concentrating systems have come into their own in solar power engineering, a thorough investigation of the heat fields (or concentration coefficient) in the focal and near-focal regions of these systems has become necessary. What is needed is a quantitative determination of the energy concentration in a receiver placed at the focal point of a concentrating system. The use of micromodular thermoelectric film receivers as sensors of power and radiant flux in the focal and near-focal plane of single- and multielement concentrating systems is shown to be theoretically possible. C.R.

A82-23356 Effects of grain boundaries on the current-voltage characteristics of polycrystalline silicon solar cells. A. Neugroschel (Florida, University, Gainesville, FL) and J. A. Mazer (Harris Semiconductor, Inc., Palm Bay, FL). *IEEE Transactions on Electron Devices*, vol. ED-29, Feb. 1982, p. 225-236. 25 refs. Contract No. XS-9-8275-1.

A82-23362 Intensity enhancement in textured optical sheets for solar cells. E. Yablonovitch and G. D. Cody (Exxon, Corporate Research-Science Laboratories, Linden, NJ). *IEEE Transactions on Electron Devices*, vol. ED-29, Feb. 1982, p. 300-305. 8 refs.

A statistical mechanical approach toward the optics of textured and inhomogeneous optical sheets adopted. As a general rule, the local light intensity in such a medium will tend to be 2n-squared(x) times greater than the externally incident light intensity, where n(x) is the local index of refraction in the sheet. This enhancement can contribute toward a 4n-squared(x) increase in the effective absorption of indirect-gap semiconductors like crystalline silicon. (Author)

A82-23391 The effect of length on absorption for a trapezoidal groove collector. V. M. Puri (Solar Energy Research Institute, Golden, CO). *Solar Energy*, vol. 27, no. 6, 1981, p. 463-467. 8 refs.

In practice, the collection efficiency or concentration ratio associated with a finite collector will significantly differ from the

predicted values using infinite collector correlations. In the present investigation nomographs have been developed showing the beam radiation collection efficiency as a function of different sun-collector relative positions with the nondimensional collector length, and base-to-depth ratio of the V-groove collector as parameter. The nondimensional lengths selected are based upon the most commonly available collector module sizes. Ray tracing technique is used for the evaluation of beam radiation augmentation. Only the direct component of solar radiation is treated in the investigation. However, to determine the effect of reflectors on the diffuse radiation interception, methodology of Dale et al. (1981) or Bannerot and Howell (1977, 1979) or Grimmer et al. (1978) can be followed. G.R.

A82-23393 Durability of porous silica antireflection coatings for solar collector cover plates. K. J. Cathro, D. C. Constaole and T. Solaga (Commonwealth Scientific and Industrial Research Organization, Div. of Mineral Chemistry, Melbourne, Australia). *Solar Energy*, vol. 27, no. 6, 1981, p. 491-496. 16 refs. Research supported by the National Energy Research Development and Demonstration Council.

A82-23395 Performance and economics of annual storage solar heating systems. S. Sillman (Solar Energy Research Institute, Golden, CO). *Solar Energy*, vol. 27, no. 6, 1981, p. 513-528. 16 refs. Research supported by the U.S. Department of Energy.

Annual storage is a means of both improving the technical efficiency of active solar systems by allowing solar heat to be collected in summer, and extending the capability of active solar systems to meet nearly 100 per cent of the load. Annual storage systems rely on a large storage tank which usually uses water as the storage medium. The winter load is met partly from day-to-day collection of solar heat, as in a conventional active solar heating system, and partly from heat stored during the summer. A description is presented of the findings from a study of the design trade-offs in annual storage systems, giving particular attention to the trade-off between collector and storage sizes. It was found that system performance increases linearly as storage volume is increased up to the point of 'unconstrained operation' where the storage tank is large enough to store all heat collected in summer. 'Unconstrained operation' is the likely economic optimum. G.R.

A82-23397 * New technologies for solar energy silicon - Cost analysis of dichlorosilane process. C. L. Yaws, K.-Y. Li, T. C. T. Chu (Lamar University, Beaumont, TX), C. S. Fang (Southwestern Louisiana, University, Lafayette, LA), R. Lutwack, and A. Briglio, Jr. (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Solar Energy*, vol. 27, no. 6, 1981, p. 539-546. 46 refs. Research supported by the U.S. Department of Energy and NASA.

A reduction in the cost of silicon for solar cells is an important objective in a project concerned with the reduction of the cost of electricity produced with solar cells. The cost goal for the silicon material is about $14 per kg (1980 dollars). The process which is currently employed to produce semiconductor grade silicon from trichlorosilane is not suited for meeting this cost goal. Other processes for producing silicon are, therefore, being investigated. A description is presented of results obtained for the DCS process which involves the production of dichlorosilane as a silicon source material for solar energy silicon. Major benefits of dichlorosilane as a silicon source material include faster reaction rates for chemical vapor deposition of silicon. The DCS process involves the reaction 2SiHCl3 yields reversibly SiH2Cl2 + SiCl4. The results of a cost analysis indicate a total product cost without profit of $1.29/kg of SiH2Cl2. G.R.

A82-23399 Simplified method for predicting photovoltaic array output. D. L. Evans (Arizona State University, Tempe, AZ). *Solar Energy*, vol. 27, no. 6, 1981, p. 555-560. 10 refs. Research supported by the U.S. Department of Energy.

A simplified procedure for predicting the long term, monthly average electrical output of photovoltaic arrays is presented. It is restricted to passively cooled, max-power tracked arrays, but is applicable to both south facing, fixed flat arrays and 2-D tracked concentrators. The procedure combines basic parameters characterizing the array with the local monthly mean temperature and the monthly Kt (ratio of the total radiation on the horizontal to the extraterrestrial radiation) to yield a monthly average array efficiency which, when multiplied by the monthly array insolation gives the electrical energy output. (Author)

A82-23575 Spray-deposited black nickel selective absorber surfaces for solar thermal conversion. M. Madhusudana and H. K. Sehgal (Indian Institute of Technology, New Delhi, India). *Applied Energy*, vol. 10, Jan. 1982, p. 65-74. 8 refs.

A low cost, single-step process employing spray pyrolysis has been developed to deposit selective black nickel coatings on commercially available aluminium and galvanised iron substrates. Parameters for growth have been optimised by a comparative study of the structural, optothermal and optical properties of these films. Optimised films of black nickel on aluminium have alpha = 0.92 and emittance (100 C) = 0.14 whereas those on galvanised iron have alpha = 0.90 and emittance (100 C) = 0.13. The films are seen to be extremely adherent to the substrates and to have stable operational characteristics under temperature cycling up to 280 C in low humidity environments. (Author)

A82-23654 # Evaluation of reliability of operational solar-energy systems. J. Mavec, R. Wolosewicz (Argonne National Laboratory, Argonne, IL), and E. Waite (Argonne National Laboratory, Idaho Falls, ID). *ASME, Transactions, Journal of Solar Energy Engineering*, vol. 104, Feb. 1982, p. 41-45. 9 refs. Research supported by the U.S. Department of Energy.

This paper presents a reliability study of two solar-energy systems using air as the heat-transfer medium. Failure modes and effects analysis are used to examine the controls of the systems for three operating modes. Principal components are identified for each mode, and a fault tree and reliability block diagram are constructed to structure the fault or failed sequence. Established failure rates are assigned to each component, and an exponential failure distribution is assumed. For components operating on demand at a given average frequency, the adjusted demand and normal operating failure rates are combined to reflect the total contribution. Representative operational times and component frequencies are found for each operating mode. A fault-tree computer code is used to determine minimal outsets to the top event, remove redundant events, and perform necessary calculations. The computer code obtains results at each level (component, cutset, and tree) using repairable and nonrepairable models. (Author)

A82-23656 # Performance of a parallel solar heat pump system. A. F. G. Bedinger, J. Tomlinson, R. L. Reid, and D. J. Chaffin (Tennessee, University, Knoxville, TN). *ASME, Transactions, Journal of Solar Energy Engineering*, vol. 104, Feb. 1982, p. 52-55. Research supported by the Tennessee Valley Authority.

The equipment, operations, operating parameters, and performance of a solar heat pump/resistance heated thermal storage bed house heating system are reported. A set of 12 solar air flat plate collectors is mounted on the roof for house heat when solar energy is available, and further heating is available from a heat pump system, with supplemental energy furnished by a limestone pebble storage tank which is charged by 15 kW resistance heating during off-peak hours. Data is provided for one winter's operation, with an analysis for combined and paired or single system performance as opposed to purchased power for a back-up conventional heating system and the power necessary to run the compressors, heating coils, and fans. An additional simulation was devised to be measured against the recorded performance. Significant energy conservation capability was observed for the solar augmented heat pump system without off-peak capability. M.S.K.

A82-23659 * # Heat transfer from combustion gases to a single row of closely spaced tubes in a swirl crossflow Stirling engine heater. C. P. Bankston and L. H. Back (California Institute of Technology, Jet Propulsion Laboratory, Energy and Materials Research Section, Pasadena, CA). *ASME, Transactions, Journal of Heat Transfer*, vol. 104, Feb. 1982, p. 55-61. 9 refs. Research sponsored by the U.S. Department of Energy and NASA.

This paper describes an experimental program to determine the heat-transfer characteristics of a combustor and heat-exchanger system in a hybrid solar receiver which utilizes a Stirling engine. The

system consists of a swirl combustor with a crossflow heat exchanger composed of a single row of 48 closely spaced curved tubes. In the present study, heat-transfer characteristics of the combustor/heat-exchanger system without a Stirling engine have been studied over a range of operating conditions and output levels using water as the working fluid. Nondimensional heat-transfer coefficients based on total heat transfer have been obtained and are compared with available literature data. The results show significantly enhanced heat transfer for the present geometry and test conditions. Also, heat transfer along the length of the tubes is found to vary, the effect depending upon test condition. (Author)

A82-23700 **Photovoltaics - Down to earth at last.** J. R. Burke (Solar Energy Research Institute, Golden, CO). *Sun at Work in Britain*, no. 12-13, 1981, p. 30-38.

The growth of terrestrial applications of solar cells is examined, with attention paid to the cost, materials, and fabrication methods now in existence. Current prices are the $10,000/kW range, with U.S. government research goals intending a reduction to less than $1000/kW by 1986. Solar Energy Research Institute studies are pursuing production cost decreases through a reduction in the number of required manufacturing steps. Efforts to directly electrochemically reduce quartz to solar-grade Si are outlined, as are the development of Si sheet manufacturing methods using porous carbon substrates or graphite filaments capped by a seed. Polycrystalline materials offer cost reductions through the acceptance of many crystals in the cells instead of a monocrystalline configuration, and hydrogenation or casting methods have reduced parasitic power losses caused by recombinations along the grain boundaries. M.S.K.

A82-23703 * **Space platforms - A cost effective evolution of Spacelab operation.** A. J. Stofan (NASA, Office of Space Science, Washington, DC). *(International Astronautical Federation, International Astronautical Congress, 31st, Tokyo, Japan, Sept. 22-28, 1980.) Acta Astronautica*, vol. 8, Nov.-Dec. 1981, p. 1299-1310. 7 refs.

The capabilities added to the Shuttle/Spacelab configuration by the addition of the Power Extension Package (PEP), the Power System (PS), and the Science and Applications Space Platforms (SASP) are reviewed with an emphasis on SASP. SASP are intended for placement in orbit by the Shuttle to test new instruments and systems, for clustering of instrumentation, and for servicing, refurbishment, repair, or augmentation by the Shuttle. The PEP permits extended stays in orbit (30 days), and the PS is an orbital solar array and energy storage system acting as a free flying spacecraft. The Shuttle can deliver payloads to the PS or attach to it for extension of the Spacelab operations. Applications of SASP for long term space-based biological experiments are outlined, and the fact that SASP do not increase the required Shuttle in-orbit time is stressed. M.S.K.

A82-23788 **Charge collection microscopy on p-WSe2 - Recombination sites and minority carrier diffusion length.** H. J. Lewerenz, S. D. Ferris, C. J. Doherty, and H. J. Leamy (Bell Telephone Laboratories, Inc., Murray Hill, NJ). *Electrochemical Society, Journal*, vol. 129, Feb. 1982, p. 418-423. 34 refs.

Charge collection microscopy of the layered semiconductor WSe2 is reported. Steps on the surfaces of layered material, bulk dislocations, and growth irregularities are identified as recombination sites. The minority carrier diffusion length perpendicular to the layer structure is determined to be 1.6 + or - 0.2 microns on a smooth surface. The results demonstrate a correlation between step-like surface structures and loss of current collection efficiency in solar energy-converting devices made from layered semiconductors. (Author)

A82-23818 **Thermodynamics of solar collectors (Zur Thermodynamik des Solerkollektors).** F. Bosnjakovic (Stuttgart, Universität, Stuttgart, West Germany). *Brennstoff-Wärme-Kraft*, vol. 33, Oct. 1981, p. 425, 426. In German.

A82-23872 **Second-stage CEC concentrator.** E. M. Kritchman (Chicago, University, Chicago, IL). *Applied Optics*, vol. 21, Feb. 15, 1982, p. 751-754. 5 refs.

The employment of a second-stage compound elliptical concentrator (CEC) designed from the principles of nonimaging optics has been proposed for the enhancement of the concentrating capability of a point focus solar concentrator and for the partial compensation of its nonideal behavior. The CEC is to be installed just behind the focal plane of the first (or primary) concentrator. Operational conditions for a 2-D and a 3-D case are considered, and an investigation based on the use of a ray tracing technique is conducted. Despite its skew-ray loss, the 3-D combination of a paraboloidal primary and a CEC second stage was found to be an almost ideal concentrator. For high reflectances the CEC two stage shows even higher efficiency than the trumpet two stage, especially for lower-grade primaries. G.R.

A82-24019 # **Second-generation parabolic trough solar energy systems optimization analysis.** R. R. Peters (Sandia National Laboratory, Albuquerque, NM). *Journal of Energy*, vol. 6, Mar.-Apr. 1982, p. 147-154. 8 refs. Research supported by the U.S. Department of Energy.

In the near future high-efficiency, low-cost, parabolic trough collectors will probably become available. The economic feasibility of these parabolic trough solar-energy systems is affected by many parameters which include component cost, load shape, fraction of the load supplied by solar energy, average temperature of the collector field and its axis of rotation, and for solar Rankine cogeneration systems, the electrical-to-thermal energy output ratio. The sensitivity of economic feasibility and system design to changes in these and other relevant parameters is discussed. System design and economics generally were found to be sensitive to component cost. They were also found to be quite sensitive to some of the other parameters in restricted ranges. (Author)

A82-24101 **Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.** Conference sponsored by the Commission of the European Communities. Edited by W. Palz (Commission of the European Communities, Brussels, Belgium). Dordrecht, D. Reidel Publishing Co., 1981. 1178 p. In English and French. $81.50.

The materials, design, fabrication, testing, applications, and instrumentation of solar cells and solar cell systems were discussed. Goals, markets, and obstacles in the near and medium term were examined, as were applications in developing countries, methods of cost reductions, and the development of Si and cell module production systems. Alternate materials were investigated for the cells, along with concentrator devices and systems, and current installations were reviewed. Attention was given to advanced systems and future applications, to cell processing, ion implantation, and testing and standards, and the implementation of CdS, amorphous Si, and MIS solar cells was explored. Fundamental work on solar cells was outlined, in conjunction with specific cells in concentrator conditions. M.S.K.

A82-24105 U.S. Department of Energy collector cost reduction program. L. M. Magid (U.S. Department of Energy, Div. of Photovoltaic Energy Systems, Washington, DC). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 158-165.

A program conducted by the United States Department of Energy that focuses on the basic research and technology development required to reduce the price of photovoltaic collectors is reviewed. Analysis of the current status of the flat-plate and concentrating collectors and projected status of the photovoltaic collector cost reduction efforts, both for flat-plate and concentrating collectors indicates that the photovoltaic industry should easily be able to meet the 1982 goal of $2.80/Wp collectors. Significant progress is also apparent toward the longer-range $0.70/Wp and $0.15-0.40/Wp goals. V.L.

A82-24106 The solar material market - Projections, needs and commitments. W. Freiesleben (Wacker-Chemitronic GmbH, Burghausen, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 166-170.

A82-24107 A strategy for cost reduction from the point of view of a French industrialist (Stratégie de réduction des coûts point de vue d'un industriel français). J. P. Gomis (Photowatt International, S.A., Argenteuil, Val-d'Oise, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 171-177. In French.

Strategies for improving the cost-performance of solar cell modules, the cells, and applications systems are reviewed, along with a summary of current research and development goals and procedures. Research is noted to concentrate intensive work on a particular cell type, on mass production methods, or to cover all methods and materials possible, and then proceed forward with all candidates showing equal promise. Noting that the DOE goals for commercially-ready prices in 1986 rest on a fall in the cost of high grade silicon, on mass production, and a projected life of 20 yr, efforts to optimize the production steps are indicated. Savings are noted to be possible in all facets of module construction, and optimization studies are recommended for coupling the solar systems to different loads for different purposes. M.S.K.

A82-24108 Industrialization of photovoltaics. J. Lindmayer (Solarex Corp.; Semix, Inc., Rockville, MD). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 178-185.

The technological, economical, and financial aspects of the industrialization of photovoltaics are briefly reviewed. Topics discussed include the role of photovoltaics in general energy production, research and development efforts, financial resources available for industrial development, marketing policies, sources of raw material, and applications. V.L.

A82-24109 Research on photovoltaic conversion - A guarantee of efficiency for the European solar energy program. M. Rodot (CNRS, Paris, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 186-193. 30 refs.

Research goals in the field of photovoltaic conversion are discussed with emphasis on the silicon material problem and the architecture of photovoltaic generators. Consideration is given to the optimal use of photovoltaic generators in the context of specific applications, integration of solar cells and storage systems, and relation between photovoltaic research and photochemical-photobiochemical research. Mansgerial and organizational problems in European photovoltaic research and development are also briefly discussed. V.L.

A82-24110 Research options as seen from U.S.A. J. J. Loferski (Brown University, Providence, RI). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 194-198. 12 refs.

Current work, and in particular theoretical research, in the area of new cell designs and tandem cells is reviewed. Three main directions of research are identified. These are: (1) improvement of solar cell efficiency by design modifications such as incorporation of minority-carrier mirrors and optical mirrors; (2) development of super-efficiency single crystal solar cells by resort to tandem solar cell systems consisting of stacks of individually optimized cells with minority-carrier and optical mirrors; and (3) development of thin film cells with the use of minority-carrier and optical mirrors. V.L.

A82-24111 Photovoltaic R&D program overview. D. L. Feucht (Solar Energy Research Institute, Golden, CO). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. D. Reidel Publishing Co., 1981, p. 199-203. 25 refs.

The current status of a research and development program conducted under contract to the U.S. Department of Energy to develop low cost solar cells ($0.15-0.40/Wp modules in 1980$) is reviewed. The emphasis of the program is on thin film and electrochemical cells with conversion efficiencies greater than 10% and multijunction cells with conversion efficiencies greater than 30%. The R&D efforts include research on polycrystalline silicon, amorphous materials, cadmium sulfide cells, gallium arsenide cells, emerging materials, and advanced concentrator and cell concepts. V.L.

A82-24112 * A U.S. view of silicon production processes. R. Lutwack (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 220-227. Research sponsored by the U.S. Department of Energy and NASA.

One of the objectives of the Low-Cost Solar Array Project is the demonstration of the practicality of processes for producing silicon, suitable for fabricating solar cells for terrestrial applications, at prices less than $14/kg. Approaches being investigated are related to a metallurgical silicon/silane/silicon process, a metallurgical silicon/dichlorosilane/Siemens-type process, and a silicon tetrachloride-zinc reduction process. There is a great probability that the first process will yield semiconductor grade Si at a price less than $14/kg. The second process appears to be capable of providing polysilicon with a purity equivalent to the present commercial semiconductor grade silicon at a price of about $20/kg. An important part of the program is the investigation of the effects of impurities on the performance of solar cells. G.R.

A82-24113 * Progress toward goals in silicon sheet development. K. M. Koliwad and M. H. Leipold (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 228-235. 5 refs. Research supported by the U.S. Department of Energy; Contract No. NAS7-100.

One of the goals of the national photovoltaic program in the U.S. is the establishment of an industry producing photovoltaic material which can be sold at a price not exceeding $0.70/W by 1986. A key element concerning the achievement of this goal is the development and utilization of improved methods for producing silicon sheet. Specific technologies being investigated in this connection can be divided into two categories. Methods of one category are based on a utilization of sheet growth techniques including film-fed growth, dendritic web, and silicon-on-ceramic processes. The approaches used by methods of the second category involve ingot and wafering processes, including Czochralski growth, the heat exchanger method, multiblade procedures, and the use of a fixed abrasive multiwire. It is found that using $84/kg silicon, most sheet technologies would yield module prices in the $2.00/Wp to $3.00/Wp range. G.R.

A82-24114 **The Wacker approach to low-cost silicon material technology.** E. Sirtl (Heliotronic GmbH, Burghausen, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 236-243. 11 refs. Research supported by the Bundesministerium für Forschung und Technologie.

Proprietary, long-term materials research programs concerned with processes having high cost/energy-saving potential for the production of high-purity solar cell silicon are discussed. Program goals include the development of rugged, high-throughput rate production equipment, and impurity handling, or defect engineering standards, which will yield photovoltaic solar energy conversion efficiencies of a minimum of 10%. Different starting materials for a variety of low-cost crystallization techniques, the machining and slicing of silicon, and such diagnostic techniques as topographic methods, multielement analysis, identification of point defects, and photovoltaic evaluation, are discussed. O.C.

A82-24115 **Ribbons and sheets as an alternative to ingots in solar cell technology.** E. Fabre and C. Belouet (Laboratoires d'Electronique et de Physique Appliquée, Limeil-Brévannes, Val-de-Marne, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 244-251. 30 refs.

Silicon sheet-shaping techniques which rely on meniscus-controlled growth are presented, and their characteristics are discussed in the scope of their economic competitiveness against the Czochralski growth for a mass production of low-cost solar cells. The current achievement differs in most of the processes, which may be due to differences in their respective maturity and level of effort, rather than in their ultimate potentialities. The dendritic WEB technique is found to have high efficiency and low throughput, and in the long range, the processes are expected to yield shaped materials with similar photovoltaic characteristics which will be an economic alternative to ingot technologies. The RAD growth technique is also discussed. D.L.G.

A82-24116 **Directional solidification of MG silicon by Heat Exchanger Method /HEM/ for photovoltaic applications.** F. Schmid, M. Basaran, and C. P. Khattak (Crystal Systems, Inc., Salem, MA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 252-256. 19 refs. Contract No. XS0-9171-1.

A82-24117 **Advances in silicon solar cell processing.** R. J. Van Overstraeten (Leuven, Katholieke Universiteit, Heverlee, Belgium). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 257-262. 16 refs.

The various technologies that are used or are under study in solar cell production are reviewed with emphasis on technologies compatible with a cost objective of $1 per peak watt. The discussion includes analysis of the design parameters based on the physics of the cells as well as the various processing steps, such as surface preparation, front junction formation, low-high junction formation for a back surface field, formation of front and back ohmic contacts, elimination of edge effects, and application of an antireflective coating. The specific objectives and criteria for every processing step are discussed and the most viable processes are identified. V.L.

A82-24118 **Comparison of solar cells from nonsingle and single crystalline silicon in a pilot production line.** K. Roy and W. Pschunder (Telefunken AG, Heilbronn, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 263-269. Research supported by the Bundesministerium für Forschung und Technologie.

An economical process has been developed for the production of solar cells for terrestrial application from low-cost cast polycrystalline silicon. The process makes it possible to produce 10 x 10 cm cells with conversion efficiencies of 9-10%, as compared with 12-13% for single-crystal cells, with yields as high as for single-crystal silicon. Ways to further optimize the process are discussed. V.L.

A82-24120 * **Low-cost solar array project progress and plans.** W. T. Callaghan (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 279-286. Research sponsored by the U.S. Department of Energy.

The considered project is part of the DOE Photovoltaic Technology and Market Development Program. This program is concerned with the development and the utilization of cost-competitive photovoltaic systems. The project has the objective to develop, by 1986, the national capability to manufacture low-cost, long-life photovoltaic arrays at production rates that will realize economies of scale, and at a price of less than $0.70/watt. The array performance objectives include an efficiency greater than 10% and an operating lifetime longer than 20 years. The objective of the silicon material task is to establish the practicality of processes for producing silicon suitable for terrestrial photovoltaic applications at a price of $14/kg. The large-area sheet task is concerned with the development of process technology for sheet formation. Low-cost encapsulation material systems are being developed in connection with the encapsulation task. Another project goal is related to the development of economical process sequences. G.R.

A82-24121 **Photovoltaic testing in the European communities.** K. H. Krebs and E. Rossi-Gianoli (Commission of the European Communities, Joint Research Centre, Ispra, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 287-292.

The facilities and testing procedures for establishing the viability of solar cells as an energy source and standards for testing and use in the European community are described for the case of the Ispra ESTI installation. Testing is carried out to determine new device performance in relation to proven devices and production methods. Because the photovoltaics industry is in its infancy, tests are functional instead of prescriptive, and indoor testing is used to verify manufacturer's performance claims, and to achieve durability under specified stress levels. Trials are also performed with solar cell modules to verify continued operation and integrity under severe environmental conditions, with projections of useful life of 10 yr. The durability is noted to be crucial to guaranteeing a satisfactory energy payback. M.S.K.

A82-24122 **The development of amorphous silicon solar cells.** W. E. Spear (Dundee, University, Dundee, Scotland). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 302-308. 24 refs. Research supported by the Commission of the European Communities.

The short circuit current is considered in a discussion of the limits of achievable conversion efficiency set by the electronic properties of presently available materials in developing amorphous silicon cells. Photogeneration and geminate recombination are discussed, and lifetime measurements on p-i-n junctions are made to show that the collection region is determined by the hole drift distance. The mechanism of hole transport and the possibility of improving it are considered, and it is concluded that volume recombination provides the main limitation in current a-Si cells. D.L.G.

A82-24123 **Development of amorphous Si solar cells in Japan.** Y. Kuwano and M. Ohnishi (Sanyo Electric Co., Ltd., Research Center, Hirakata, Osaka, Japan). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 309-318. 39 refs. Research supported by the Agency of Industrial Science and Technology.

The development of a-Si solar cells in Japan is reviewed with discussions on fabrication techniques, cell structures, and perfor-

mances of a-Si solar cells. Recent advances in the field are characterized by conversion efficiencies of 3.4-5.2% for a-Si:H, and 1.3-2.7% for a-Si:F:H, both of which are on small cells of not greater than about 1 sq cm. Large area cells up to 10 x 10 sq cm have been developed with conversion efficiencies of up to about 3.6%. New types of high output voltage photovoltaic devices have also been developed, which are constructed of multilayered and cascade-type solar cells. D.L.G.

A82-24124 Post-hydrogenation of CVD amorphous silicon - A promising preparation process for solar cells. N. Szydlo, D. Kaplan, and R. Poirier (Thomson-CSF, Laboratoire Central de Recherches, Orsay, Essonne, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 317-321. 7 refs.

Properties of Si solar cells prepared by CVD with a low hydrogen content and subsequent treatment in a hydrogen plasma to add a controlled amount of hydrogen are reviewed, along with a study of the mechanisms of carrier collection in Schottky barrier cells. Phosphorus doping was accomplished by means of its addition in the silane gas mixture, and precisely controlled hydrogenation yielded higher cell efficiencies than undoped glow-discharge produced cells, although the optical absorption was not significantly altered. A correlation was found in undoped layers between the carrier collection length and space charge width. The quantum yield was independent of doping and applied negative bias. No evidence was observed of a strong electric field dependence in the Schottky barrier structures, implying that carrier mobility and/or built-in electric fields induced separation of the hole pairs. M.S.K.

A82-24125 Properties of fluorinated amorphous silicon solar cells. M. Moeller, R. D. Plaettner, W. Stetter, and B. Rauscher (Siemens AG, Forschungslaboratorien, Munich, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 322-326. 5 refs. Research supported by the Bundesministerium für Forschung und Technologie.

The photovoltaic performance of hydrogenated-fluorinated, hydrogenated a-Si, Pt-Schottky, MIS, and p-i-n solar cells were compared, along with the effects of dc and RF processes for preparing fluorinated Si solar cells. Increases of 10% in the mole fraction of F were observed after the dc glow discharge over the RF formation of a-Si:F:H cells. An upward shift in the peak intensity by about 60 MeV in the fluorinated cells was concluded to be due to the concentration of F, with a bandgap increase of 0.4 MeV with the mole fraction of F augmented from 1.5-6%. AM1 illumination tests of the cells showed that the Schottky a-Si:F:H cells showed lower short-circuit currents than the a-Si:H cells, with an open-circuit current which could be increased by the formation of an oxide layer after heating in moist oxygen. The a-Si:H p-i-n cells were observed to have properties of long-term stability. M.S.K.

A82-24126 Sprayed cadmium sulphide solar cells. G. A. Roderick (Photon Power, Inc., El Paso, TX). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 327-334.

A spray process for the production of thin-film (5 microns) Cd/Cu(x)S solar cells is discussed and typical results are presented for the resulting cells. Plans for long-term very-large-scale production of cadmium sulfide cells are examined together with projected cost data and basic design criteria. A schematic representation of the cell, spray process, and an I/V curve are given. V.L.

A82-24127 Cu2S-CdS sprayed solar cells. G. Bordure, C. Llinares, J. Bougnot, M. Perotin, H. Luquet, S. Belgacem, and M. Savelli (Montpellier II, Université, Montpellier, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 335-339. 11 refs. Research supported by the Centre National de la Recherche Scientifique and Commission of the European Communities.

Cu2S-CdS solar cells fabricated by spraying and dipping techniques are characterized with respect to their electrical and optical properties. It is shown that the current response of heat treated cells is limited only by the light absorption in Cu2S, with collection efficiency of the junction being close to unity. Losses during treatment and early degradation which are smoothly sensitive to wavelength, are mainly related to the collection efficiency of the junction. Results suggest that the open circuit voltage was the greatest potential for improvement. V.L.

A82-24128 Evaporated CdS-Cu/x/S solar cells. W. H. Bloss, F. Pfisterer, and H.-W. Schock (Stuttgart, Universität, Stuttgart, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 340-347. 8 refs. Bundesministerium für Forschung und Technologie Contract No. ET-4045-B; Commission of the European Communities Contract No. ESC-R-003-D.

Large-area CdS-Cu(x)S solar cells produced by evaporation of CdS and by applying the wet process are discussed with reference to technological procedures and performance characteristics. The I-V curve is presented for a cell with an active area of 42 sq cm. A conversion efficiency of 7.3% has been achieved without using antireflection coatings. A simple procedure for preparing integrated generators, 15 x 30 sq cm, is presented; the generator efficiency of eight cells connected in series amounts to 4%. V.L.

A82-24129 The need for photovoltaic unit operations experimentation. T. W. F. Russell, B. N. Baron, and R. E. Rocheleau (Delaware, University, Newark, DE). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 348-352. 5 refs.

It is shown that unit operations experimentation is necessary for the further development of the photovoltaics industry, and the formulation of a commercial-scale process design for the deposition of cadmium sulfide-copper sulfide solar cell active semiconductor layers is described as an illustration. Coupled heat and mass balance equations were developed to model the evaporation of cadmium sulfide and, after verification at the bench scale, the model was used in the design of a continuous, reel-to-reel vacuum coater for cadmium sulfide deposition. The results of initial experiments with this vacuum deposition unit are presented. O.C.

A82-24130 Operational, reliability, and maintenance experience with photovoltaic concentrator arrays. E. L. Burgess and B. D. Shafer (Sandia National Laboratory, Albuquerque, NM). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 360-367. 11 refs. Research supported by the U.S. Department of Energy.

The status of photovoltaic concentrator technology in the United States is discussed. Operational experience in addition to component reliability and system maintenance are discussed, including the applicable solar thermal concentrator reliability and maintenance experience. Efficiencies have increased from 6-7% to 12% for silicon arrays, and initial data for a gallium arsenide array yield 13-15%. No unsolvable reliability or maintenance problems are expected. D.L.G.

A82-24131 Sun tracking controller for multi-kW photovoltaic concentrator system. R. P. Semma and M. S. Imamura (Martin Marietta Aerospace, Denver, CO). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 375-380.

A two-axis suntracking controller is presented, which is designed to achieve low cost, high performance reliability, and operational flexibility for multi-kW to multihundred-kW photovoltaic concentrator applications. The controller is based on an active sun sensing approach, allows an array assembly to track the sun within five arcmin, and has the capability to stow the array at night or during inclement weather conditions, communicate with an external computer, and provide autonomous operation and diagnostic monitoring. This third generation design represents a significant improvement

over the two earlier generations, which were based on hard-wire logic. D.L.G.

A82-24132 The Sophocle program (Le programme Sophocle). M. Claverie, A. Dupas (CNRS, Paris, France), and D. Esteve (CNRS, Laboratoire d'Automatique et d'Analyse des Systèmes, Toulouse, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 381-390. In French.

The development of a standardized tracking and concentrating solar cell power generating system suitable for industrial production is reviewed. A 1 kW module was fabricated for Si cells under 45 suns concentration, and with a cooling system to maintain cell efficiency. Fresnel lenses provide the concentration, and tracking is accomplished on an altazimuth tracking stand, which limits the area of capture to 50 sq m, corresponding to about 5 kW. Characteristics of the system include 4 sq cm Si solar cells, concentration efficiencies of 75 percent, surface areas ranging from 6-50 sq m, tracking accuracy to within 4 mrad, and natural convective cooling over an aluminum trough with channeled sides. Units have been deployed in India, Algeria, Senegal, Mexico, Brazil, and Gabon to gather operational data. M.S.K.

A82-24133 New concepts for static concentration of direct and diffuse radiation. A. Luque, J. Eguren, J. M. Ruiz, A. Cuevas, J. del Alamo, J. M. Gomez, M. Acuña, and G. Sala (Escuela Técnica Superior de Ingenieros de Telecomunicación, Madrid, Spain). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 396-400.

Rules for casting maximum energy on a cell placed in a static concentrator of minimum entry aperture are derived in an investigation of the feasibility of static concentrators and their operating limits. A concentration of 9.13 is found to be the upper bound for collecting the direct sunbeam throughout the year, and a concentration of 4.5 is the upper bound for collecting diffuse light. A prototype concentrator with bifacial cells is fabricated, which is fully static and accepts a part of the diffuse radiation so that it may be handled in a manner similar to that of a conventional flat panel. A panel efficiency of 9.1 percent is predicted in an improved panel, with a cost estimate for medium size production of $3.19 W/peak. D.L.G.

A82-24134 Advanced concepts for photovoltaic concentration. W. H. Bloss, M. Griesinger, and E. R. Reinhardt (Stuttgart, Universität, Stuttgart, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 401-407. 6 refs.

A dispersive concentrating system is presented, which is based on phase holograms exhibiting only minimum absorption, and allows high concentration and simultaneous splitting of the spectral regions. Local hardening effects can be achieved by spatial variation of high light intensity in dichromated gelatin films on glass substrates, which leads to optical density profiles and results in a selective Bragg reflection at direct illumination. The diffraction efficiency and the spectral sensitivity of these transmission volume holograms are described. Efficiencies of over 30% can be obtained in connection with different solar cell systems matched to the spectral regions. D.L.G.

A82-24135 Growth and characterization of cascade solar cells. S. M. Bedair, M. L. Timmons, and M. Simons (Research Triangle Institute, Research Triangle Park, NC). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 408-412. 6 refs. Research supported by the U.S. Department of Energy.

Monolithic, two-junction cascade solar cells are fabricated in two different III-V materials systems: Al-Ga-As and Al-Ga-As-Sb. The Al-Ga-As system employs a GaAs low bandgap cell and a 1.9 eV AlGaAs high bandgap cell connected by an AlGaAs tunnel junction, and although the cell does not possess the optimum bandgap values for maximum efficiency, it is attractive from a developmental standpoint since it employs a proven materials system closely lattice matched throughout its compositional range. The Al-Ga-As-Sb system offers an optimum bandgap combination for concentrator applications, although experimental devices suffer from a low open circuit voltage problem. D.L.G.

A82-24136 On the conversion of solar radiation with fluorescent planar concentrators /FPCs/. A. Zastrow, K. Heidler, R. E. Sah, V. Wittwer, A. Goetzberger (Fraunhofer-Institut für angewandte Festkörperphysik, Freiburg im Breisgau, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 413-417. 14 refs. Bundesministerium für Forschung und Technologie Contract No. ET-4190-A.

The utilization of infrared fluorescent dyes in fluorescent planar concentrators is discussed in an investigation of 30 infrared laser dyes. It is shown theoretically that quantum yields and stability will be lower in the infrared region than in the shorter wavelength region. The quantum yields of fluorescence may depend strongly on solvent viscosity and temperature in several cases, and since solvent viscosity also decreases with increasing temperature, the degradation of efficiency may be due to change in viscosity more likely than to change in temperature. The suppression of radiationless processes by deuteration of NH2-groups in oxazine dyes significantly enhances quantum yields. D.L.G.

A82-24137 Measurement of the spectral response of silicon solar cells under highly illuminated conditions. B. C. Chambers and C. E. Backus (Arizona State University, Tempe, AZ). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 418-422. U.S. Department of Energy Contract No. 49-1510.

In an investigation of the behavior of photovoltaic devices under concentrated sunlight, the spectral response of several silicon solar cells was measured under illumination levels varying from approximately 1 mW/sq cm to 12,500 mW/sq cm for 11 wavelengths distributed over the solar spectrum. The spectral response was found to increase with increasing concentration for each of the wavelengths, and the spectral response for the shorter wavelengths increased by 1-40% while the response increased by 4-90% for the longer wavelengths. It is concluded that the filling of recombination centers with increased illumination could result in increasing the observed current output. D.L.G.

A82-24138 Solar energy applications in telecommunications (Les applications de l'énergie solaire dans les télécommunications). J. Girard (CNET, Issy-les-Moulineaux, Hauts-de-Seine, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 424-434. In French.

The results of a half-decade of a coupled wind-photovoltaic powered, remotely sited telecommunications installation called 'Aerosolec' are reported. A station is examined which was situated at 500 m altitude between Nice and Monaco and comprised a 4 module solar cell plant generating 180 W, a 300 W windpowered generator, and a battery bank. The batteries were linked by a diode, charged by the photovoltaics only when load was met, and provided voltage when the wind/solar cell configuration failed to produce enough power to meet demand. Output of the generators and meteorological parameters were recorded for two years. The station drew a nominal 180W, which was met by the power systems, and involved an actual extra discharge of excess energy. Other, similar stations are outlined, and the use of coupled wind/solar systems for telephone service in remote sites, for optic fiber repeaters, and for telephone relay station are recommended. Cost advantages are seen with the solar/wind systems over liquid hydrocarbon fueled generator systems for low power demand installations. M.S.K.

A82-24139 Experience acquired in the field of low power photovoltaic application to educational television. Y. Houssin (Bureau Yves Housin, Paris, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference,

Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 435-438.

Low-power photovoltaic applications in certain African regions lacking electrification are discussed in an investigation to determine the extent of silicon surface required for various geographical areas. Experience acquired in Africa using solar energy for the power supply of audiovisual receivers is discussed. A definition of the best performing equipment with the lowest power consumption is obtained, taking maintenance into consideration. A high level of reliability has been reached with, for example, an average breakdown of less than 1 unit every two years for the 20,000 television receivers installed in the Ivory Coast. D.L.G.

A82-24140 The application of photovoltaics to water pumping and irrigation in Africa. B. Verspieren (Société Mali Aqua Viva, San, Mali). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 439-445. In French.

A82-24143 * Survey of residential and intermediate photovoltaic applications. J. L. Hesse (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 498-504. Research sponsored by the U.S. Department of Energy and NASA.

The construction and operation of residential and intermediate size photovoltaic power systems as performed by the DOE Photovoltaics Program are reviewed. The program is directed toward the development of economically competitive, commercially available, photovoltaic power systems to provide safe and reliable energy for a wide range of applications. Systems which are currently operational or in construction range in size from 5 kWp to 225 kWp, and real-world testing is being pursued with residential, industrial, institutional, and commercial systems to establish their feasibility and readiness for commercialization. D.L.G.

A82-24144 Analysis of a 60 kW photovoltaic power plant after the first year of operation. D. J. Roesler (U.S. Department of Energy, Washington, DC), D. D. Faehn (U.S. Army, Mobility Equipment Research and Development Command, Fort Belvoir, VA), and L. R. Suelzle (Helionetics, Inc., San Diego, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 505-512.

The performance of the 60 kW photovoltaic system at Mt Laguna Air Force Station was analyzed after the first year of operation. The 60 kW system met or exceeded nearly all of the technical requirements originally established, generating nearly 100,000 kWh and operating about 3400 hours. The downtime was extremely low, and a 16% reduction in maximum available power of the array was experienced, which is attributed to module engineering problems. All observations to date support the belief that a dc-ac photovoltaic energy conversion system without on-site energy storage can effectively augment a utility grid, even in a remote location. D.L.G.

A82-24145 Photovoltaic pilot projects in the European community. F. C. Treble, G. Grassi, and W. Schnell (Commission of the European Communities, Brussels, Belgium). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 513-520.

The paper presents proposals received for the construction of photovoltaic pilot plants as part of the Commission of the European Communities' second 4-year solar energy R and D program. The proposed plants range from 30 to 300 kWp and cover a variety of applications including rural electrification, water pumping, desalination, dairy farming, factories, hospitals, schools and vacation centers. Fifteen projects will be accepted with a total generating capacity of 1 MWp, with preference given to those projects involving the development of new techniques, components and systems. D.L.G.

A82-24146 Photovoltaics in the context of off-grid small power systems. A. Gabriel (Shell International Petroleum Co., Ltd., London, England) and A. W. De Ruyter Van Steveninck (Shell International Petroleum Maatschappij, The Hague, Netherlands). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 521-525.

Practical criteria which determine the cost effectiveness in different applications of stand-alone off-grid continuous power systems up to 20 kW are examined. The analysis is limited to systems based on internal combustion engines and photovoltaic systems. It is shown that for nonmobile continuous power systems with offtakes above 20-25%, photovoltaic cost parity with 5 kW diesel systems is expected to occur in the second half of this decade or in the first half of the next decade, depending mainly on the fuel cost to the consumer. Larger diesel systems show improved costs due to scale benefits which are not available to photovoltaic systems. V.L.

A82-24147 A 50 kW photovoltaic power plant coupled to the 15000 V electricity grid. J. L. Chenon and D. J. Denis (Société d'Optique, de Mécanique, d'Electricité et de Radio, Argenteuil, Val-d'Oise, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 526-530.

Plans and components for providing prototype photovoltaic power plants to several Greek islands are discussed. The systems will produce 50 kW, with power conditioning for interconnection with submarine cable supplied grid power or with battery storage where no interconnection exists. The plants will comprise 1500 modules, each producing 33 W, with seasonal adjustment of the tilt angle of each subarray. Battery storage, where necessary, will contain 250 kWh, and the 50 kW power output of the plants is intended to in every case be less than the power required by the users. It is noted that wind measurements have also been taken along with insolation data, and future uses of coupled wind/solar installations are indicated. M.S.K.

A82-24148 Hardware simulation of a scaled down photovoltaic power system. R. Weiss and J. Appelbaum (Tel Aviv University, Tel Aviv, Israel). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 531-534.

A state of a photovoltaic power system study intermediate between the computer simulation (software simulation) and the final system realization is proposed. It involves a hardware construction and a real-time operation of a scaled-down system, built with real components that are normally included in a photovoltaic plant. In this way, detection and correction of system operation problems can be allowed for in the final full-scale design. Simulation and scaled down system operation contribute to the photovoltaic system design knowledge and complement each other. C.R.

A82-24149 Status of the German terrestrial photovoltaic activities. R. Koepke and K. Ullrich (Kernforschungsanlage Jülich GmbH, Jülich, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 538-540.

The budget, laboratories involved, and research and development areas of the West German photovoltaic activities are outlined. Government funding extraneous to universities and private industry totaled 27.3 million Deutche marks in 1979, with 80% of the funds devoted to Si cell development and applications. The formation of amorphous Si cells was explored in terms of glow discharge, plasma deposition, and CVD methods. Unconventional cells such as CdSe-MIS, Cu2O/ZnO, Zn3P2, and WSe2 cells have been investigated, along with fluorescent concentrators, polycrystalline Si wafers, as well as production line prototype CdS/Cu2S thin film solar cells. M.S.K.

A82-24150 * Current status of solar cell performance of unconventional silicon sheets. H. I. Yoo (Applied Solar Energy

Corp., City of Industry, CA) and J. K. Liu (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 548-552. NASA-supported research.

It is pointed out that activities in recent years directed towards reduction in the cost of silicon solar cells for terrestrial photovoltaic applications have resulted in impressive advancements in the area of silicon sheet formation from melt. The techniques used in the process of sheet formation can be divided into two general categories. All approaches in one category require subsequent ingot wavering. The various procedures of the second category produce silicon in sheet form. The performance of baseline solar cells is discussed. The baseline process included identification marking, slicing to size, and surface treatment (etch-polishing) when needed. Attention is also given to the performance of cells with process variations, and the effects of sheet quality on performance and processing. G.R.

A82-24151 * Multiple EFG silicon ribbon technology as the basis for manufacturing low-cost terrestrial solar cells. B. Mackintosh, J. P. Kalejs, C. T. Ho, and F. V. Wald (Mobil Tyco Solar Energy Corp., Waltham, MA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 553-557. 5 refs. Contract No. JPL-954355.

Mackintosh et al. (1978) have reported on the development of a multiple ribbon furnace based on the 'edge defined film fed growth' (EFG) process for the fabrication of silicon ribbon. It has been demonstrated that this technology can meet the requirements for a silicon substrate material to be used in the manufacture of solar panels which can meet requirements regarding a selling price of $0.70/Wp when certain goals in terms of throughput and quality are achieved. These goals for the multiple ribbon technology using 10 cm wide ribbon require simultaneous growth of 12 ribbons by one operator at average speeds of 4 to 4.5 cm/min, and 13% efficient solar cells. A description is presented of the progress made toward achieving these goals. It is concluded that the required performance levels have now been achieved. The separate aspects of technology must now be integrated into a single prototype furnace. G.R.

A82-24152 Progress in the growth and performance of RAD silicon sheets. C. Belouet, C. Belin, J. Schneider, and J. Paulin (Laboratoires d'Electronique et de Physique Appliquée, Limeil-Brévannes, Val-de-Marne, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 558-562. 10 refs. Research sponsored by the Commission of the European Communities and Commissariat à l'Energie Solaire.

Polysilicon sheets up to 6 m in length have been grown continuously by the RAD process on carbon substrates coated with rough laminar polycarbon. The effective diffusion length in as-grown smooth layers reaches a maximum of 60 microns at pulling rates up to 10 cm/min. RAD solar cells with an antireflective coating made from continuous ribbons exhibit AM1 conversion efficiencies above 9 percent. V.L.

A82-24154 * Evaluation of silicon-on-ceramic material for low-cost solar cells. J. D. Zook (Honeywell Corporate Technology Center, Bloomington, MN). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 569-573. 8 refs. Research sponsored by the U.S. Department of Energy and NASA.

The silicon-on-ceramic (SOC) process produces thin layers of silicon on inexpensive ceramic substrates. The layers are produced by unidirectional solidification of molten silicon, and are polycrystalline. Solar cells made from SOC material have performed with a conversion efficiency of 10.5%. In connection with the objective to improve the efficiency of SOC solar cells, an investigation was conducted to assess the relative importance of grain boundaries and impurities. In order to separate the two effects, light-beam-induced current (LBIC) measurements of the short-circuit current were made using a micron-sized light beam from a monochromator. The LBIC measurements are closely related to solar cell performance since the technique identifies the various spatial and spectral contributions to solar cell current. On the basis of the obtained results, it appears that structural defects are more important than chemical defects in limiting the performance of present SOC solar cells. G.R.

A82-24155 Epitaxial growth of silicon by CVD in a hot-wall furnace. J. Bloem, Y. S. Oei, J. Hanssen, and L. J. Giling (Nijmegen, Katholieke Universiteit, Nijmegen, Netherlands). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 574-578.

A new method is proposed for growing epitaxial layers of silicon whereby silicon is deposited from the vapor phase in a reactor placed inside a furnace instead of being heated by an RF coil. The method produces silicon slices of high packing density and is characterized by low energy consumption. Epitaxial growth in a furnace can be realized without any deposition on the reactor walls. V.L.

A82-24157 Characterization of plasma-sprayed silicon layers as possible base material for solar cell fabrication. M. S. Alaee and T. Hashemi (Materials and Energy Research Centre, Teheran, Iran). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 584-588.

Plasma-sprayed silicon films were characterized using X-ray diffractometry, Auger electron spectroscopy, scanning electron microscopy, and secondary ion mass spectrometry. It is shown that plasma spraying of silicon powder makes it possible to obtain reproducible films with controlled thickness and impurity. The films are highly polycrystalline with crystallite sizes up to 100 microns. An attempt has been also made to dope the sprayed film to fabricate a p-n junction. Initial results show that a fairly well defined space-charge region can be formed. V.L.

A82-24160 Study of the elaboration of semicrystalline silicon ingots. J. Fally and C. Guenel (Compagnie Générale d'Electricité, Centre de Recherches, Marcoussis, Essonne, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 598-602. Commissariat à l'Energie Solaire Contract No. 78-015.

The formation of semicrystalline Si ingots as a process competitive with ribbon-pulling methods of fabricating solar cells to achieve a 10-fold reduction in the cost of solar cells is described. A thermal gradient is established in a graphite furnace to ensure a directional characteristic in the crystallization. A p-type semicrystalline material is currently achievable using semiconductor-grade Si for the melt, and methods have been devised for reusing the crucible. Grains have a diameter less than 1 mm, while basaltic grains perpendicular to the plane of the wafer are in the 2-3 cm range. The presence of isolated dislocations, lineages, and twins in the grains have contributed to a low efficiency of 8.07 percent thus far although the inclusion of an AR coating is expected to raise the figure to over 10 percent. M.S.K.

A82-24161 * Development of large area, low-cost, solar cell processing sequence. S. Chitre (Photowatt International, Inc., Tempe, AZ) and J. Donon (Photowatt International, S.A., Argenteuil, Val-d'Oise, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 608-614. Contract No. JPL-954265.

A cost effective process based on state-of-the-art technology has been developed for the production of large-area (55 sq cm and larger) solar cells. The process is capable of providing silicon and polysilicon cell efficiencies in excess of 10% at an overall cost of 12 c/watt in 1980 dollars. The process provides large throughputs and is suitable for complete automation with high yields. Various stages of the process development are discussed. V.L.

A82-24164 Optimized diffusion parameters for cells made by columnar silicon. F. Ferrazza, F. C. Matacotta (Genova, Università,

Genoa, Italy), S. Pidatella, and L. Sardi (Ansaldo Elsag /AE/, Genoa, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 625-629. 5 refs.

The behavior of phosphorus in a two-step diffusion process is examined in an investigation to find the best first-step diffusion conditions in order to obtain maximum cell efficiency. Results indicate that at 750 C for 9 h, a deeper junction depth can be made, increasing the dead layer and obtaining cells with over 12.5 percent efficiency. Lifetime and EBIC measurements show good correlation with short circuit current values by obtaining lifetime values between 1.1 and 2.8 microns. D.L.G.

A82-24165 Direct coupled microwave thermal processing for photovoltaic device fabrication. D. C. Guidici (Siltec Corp., Menlo Park, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 630-634. Research sponsored by the U.S. Department of Energy.

A microwave thermal processing technology has been developed which reduces cycle time and energy requirements for solar cell manufacture through the direct coupling of a tuned microwave field to the material processed. The microwave processing is shown to be feasible for both junction formation and metallization sintering; cells produced have an efficiency of 8%. Diffusion throughput is satisfactory if multiple wafer processing (coin stacks) is used. Metallization sintering throughput is, however, limited by the single wafer process capability, and another form of applicator would be necessary to make microwave heating economically attractive for this process. V.L.

A82-24167 Effects of special processing on diffusion lengths in polycrystalline silicon solar cells. W. A. Orr, G. Mabilia, and V. Paraggio (Napoli, Università, Naples, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 646-649. 5 refs. Consiglio Nazionale delle Ricerche Contract No. 79,01631,92.

The effects of process parameters on the characteristics of polycrystalline silicon solar cells have been investigated by localized spectral response measurements which permits independent determination of diffusion lengths in the grain bulk and near the boundary. It is found that the n-type prediffusion leads to a reduction in average diffusion length, whereas p-type prediffusion yields longer diffusion lengths in p-type substrates. The results are explained in terms of relative amounts of dopant preferentially diffused into grain boundaries. V.L.

A82-24168 Scanning spectral response measurements of large grain polysilicon solar cells for process optimization. M. Arienzo, A. Muleo (Solaris S.p.A., Florence, Italy), and W. A. Orr (Napoli, Università, Naples, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 650-653.

Solar cells fabricated from bicrystalline silicon wafers with (111) and (100) orientations have been characterized using scanning spectral response measurements with a view to optimize the cell production process. In particular, variations in the quantum yield of the cells with distance from the grain boundary have been analyzed. On the basis of the results obtained, an optimum Al sintering time of 60 sec has been selected. It has also been shown that even in silicon with short diffusion lengths, a BSF can be used to enhance cell output. V.L.

A82-24169 The influence of surface conditions on the open circuit voltage of silicon solar cells. J. Nijs, F. D'Hoore, R. Mertens, and R. Van Overstraeten (Leuven, Katholieke Universiteit, Louvain, Belgium). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 659-663. 6 refs. Research supported by the Office of the Prime Minister and Nationale Fonds voor Wetenschappelijk Onderzoek.

A series of p(+)nn(+) back-surface-field solar cells have been investigated with reference to the sensitivity of the open-circuit voltage to the surface recombination velocity. It is found that in p(+)nn(+) cells with shallow, relatively low-doped emitters, the emitter is transparent to minority carriers, and the dark saturation current density due to injection of minority carriers is comparable with the bulk component. Thus, the open circuit voltage of these devices is sensitive to the surface condition. V.L.

A82-24170 Electrical properties of grain boundaries in nonsingle crystalline silicon solar cells. W. Schmidt, G. Friedrich, and K.-D. Rasch (Telefunken AG, Heilbronn, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 664-673. 17 refs. Research supported by the Bundesministerium fur Forschung und Technologie.

The paper investigates the effect of grain properties and boundaries on the performance of solar cells made from multicrystalline silicon, including fast-pulled Czochralski-grown silicon and cast silicon. Performance parameters include photovoltaic characteristics, spectral response, effective diffusion length and local photoresponse. Cast silicon with base resistivity higher than 1 omega cm exhibits a uniform photoresponse within the grains comparable to single crystalline silicon cells, and the photoresponse decrease at the grain boundaries is low, due to the predominance of the coherent grain boundaries. It is shown that the local photoresponse can be used as a parameter to characterize grain and grain boundaries. D.L.G.

A82-24171 * Screenable all-metal solar cell electrodes of nickel and copper. B. Ross (Bernd Ross Associates, San Diego, CA) and D. B. Bickler (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 674-678. 6 refs.

Screenable thick film solar cell electrodes are made using the all-metal electrode system, which eliminates the commonly used glass frit and substitutes an oxide scavenger such as silver fluoride. The low temperature firing copper metal systems give good results on solar cells obtaining cell efficiencies of 13% AM1, and adhering sintered structures are demonstrated with nickel systems. The potential effect of copper upon cell performance at elevated temperatures over long periods of time is determined, and it is found that the formation of a copper-silicon eutectic at 550 C produces needle-like structures with broad bases on the silicon, extending into and occasionally through the metallization layer. D.L.G.

A82-24172 Reliable screen-printed contacts on silicon solar cells. J. Michel, H. Baudry (Laboratoires d'Electronique et de Physique Appliquée, Limeil-Brévannes, Val-de-Marne, France), D. Diguet, and G. David (La Radiotechnique Compelec, Caen, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 679-683. 5 refs. Research supported by the Commissariat à l'Energie Solaire.

A screen-printing process for phi 100 mm silicon solar cells is examined. The adherence of silver to silicon is obtained with a glass binder designed to be steam boiling water (SBW) resistant, and the dissolution of the silicon surface by the glass is analyzed. It is found that when the firing temperature of the screen-printed conductors increases, the mechanical and SBW resistance increase; and since the junction depth has to be increased at the same time, the cell output power decreases. A 0.5 micron junction depth and a firing temperature of 680 C appear to be the best trade off, leading to omega 100 mm cells with screen-printed contacts exhibiting good electrical performances, a 300 g standard tensile strength, and over 500 hours SBW lifetime. D.L.G.

A82-24173 * Silicon solar cells with nickel/solder metallization. R. C. Petersen (Solarex Corp., Rockville, MD) and A. Muleo (Solaris S.p.A., Florence, Italy). In: Photovoltaic Solar Energy

Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 684-690. Research supported by the U.S. Department of Energy; Contract No. JPL-954854.

The use of nickel plus solder is shown to be feasible for contact metallization for silicon solar cells by offering a relatively inexpensive method of making electrical contact with the cell surfaces. Nickel is plated on silicon solar cells using an electroless chemical deposition method to give contacts with good adhesion, and in some cases where adhesion is poor initially, sintering under relatively mild conditions will dramatically improve the quality of the bond without harming the p-n junction of the cell. The cells can survive terrestrial environment stresses, which is demonstrated by a 1000 hour test at 85 C and 85% relative humidity under constant forward bias of 0.45 volt. D.L.G.

A82-24174 Status, technology and development of silicon solar cells at INER. S. S. Jao, H. H. Tseng, C. Cheng, Y. C. Tzeng, H. H. Chang, and H. L. Hwang (Institute of Nuclear Energy Research, Lungtan, Republic of China). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 691-695.

Test runs using 200 5-cm-diameter silicon wafers are carried out, yielding 87% with an AM1 conversion efficiency greater than 11.5%. The highest efficiency is 12.7%. Concentrator solar cells of 2 x 2 sq cm are made with an AM1 efficiency of 14%. Solar cells with a diameter of 7.5 cm have attained AM1 efficiencies of more than 11.3%, and texturized solar cells of the same diameter fabricated from rejected wafers show AM1 efficiencies of 9.5-10.5%. It is noted that solar panels comprising 88 cells with a maximum output power of 13.5 W have been manufactured. The results of a 6-month test of a photovoltaic charge station for electric motorcycles are reported. C.R.

A82-24175 * Application of laser annealing to solar cell junction formation. J. S. Katzeff, M. Lopez (Lockheed Missiles and Space Co., Inc., Advanced Manufacturing Technology Dept., Sunnyvale, CA), and R. H. Josephs (California Institute of Technology, Jet Propulsion Laboratory, Energy Conversion Systems Section, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 708-712. Research sponsored by the U.S. Department of Energy and NASA.

The possibility of using high-energy Q-switched Nd:glass lasers to form pn junctions in solar cells by annealing ion-implanted substrates is investigated. The properties of laser annealed cells are analyzed by electrical, transmission electron microscopy, Rutherford backscattering and secondary ion mass spectrometry techniques. Tests indicate the laser annealed substrates to be damage-free and electrically active. Similar reference analysis of ion-implanted furnace-annealed substrates reveals the presence of residual defects in the form of dislocation lines and loops with substantial impurity redistribution evident for some anneal temperature/time regimes. Fabricated laser annealed cells exhibit excellent conversion efficiency. It is noted that additional improvements are anticipated once the anneal parameters for a back surface field are optimized. C.R.

A82-24176 Laser-annealed silicon solar cells - A comparison between ion-beam and glow discharge implantation. J. Michel, C. Fages (Laboratoires d'Electronique et de Physique Appliquée, Limeil-Brévannes, Val-de-Marne, France), J. C. Muller, P. Siffert (CNRS, Centre de Recherches Nucléaires, Strasbourg, France), D. Hoonhout, T. de Jong, and F. W. Saris (Stichting voor Fundamenteel Onderzoek der Materie, Amsterdam, Netherlands). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 713-718. 7 refs. Research supported by the Commissariat à l'Energie Solaire.

The goal is to define optimum parameters for the implantation and annealing procedure and to make a comparison between the two ways of implantation. It is noted that shallower implantations lead to better solar cell performance. For low-energy implantations, the laser treatment becomes the dominant factor determining the layer characteristics. In addition, it is found that there is an optimum for the implanted dose and for the laser energy density applied. Relatively large leakage currents are observed, suggesting the presence of defects near the junction probably due to the laser treatment. Furnace annealing is found to be required in every case. C.R.

A82-24178 Comparative study of the thermal characteristics of various solar cell module structures. D. Diguet, J. Anguet (Radiotechnique Compelec, Caen, France), J. Francin, and J. J. Marchal (Société Nationale Industrielle Aérospatiale, Cannes, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 726-730. Commission of the European Communities Grant No. 488-78-3-ESF.

The heat dissipation mechanisms in various solar cell module configurations are analyzed both experimentally and theoretically. A cell in which there is less absorption of infrared sunlight is proposed. Attention is also given to the balance between the conductive and convective effect versus the module design, the room temperature, and the convection system. Temperature data are given for various cell and module designs. It is shown that the best trade-off is obtained from a module in which glass plates are used with specially designed low-infrared-absorbing cells; here, the system 'rejects' the sunlight that is inactive with regard to the electrical conversion efficiency. It is noted that this dissipating structure could be competitive if the cost sharing between cell and encapsulation were modified. C.R.

A82-24179 * Terrestrial photovoltaic performance reference conditions. R. G. Ross, Jr. (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 731-735. Research supported by the U.S. Department of Energy and NASA.

The rationale behind the selection of key photovoltaic performance reference (reporting) conditions, including the standard Air Mass 1.5 solar spectrum and reference irradiance and cell temperature levels, is investigated. Besides providing a repeatable reference for performance comparisons, it is shown that the choice of reference conditions directly controls the accuracy of array energy output prediction calculations. Conclusions are drawn on the accuracy associated with present reference conditions, and recommendations are made concerning alternative reference conditions with improved accuracy. C.R.

A82-24182 Optical measurement of cell temperature in a solar array. B. Theys, P. Baruch, and J. Maire (Ecole Normale Supérieure, Paris, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 746-750. 7 refs. Commissariat à l'Energie Solaire Contract No. 79-127.

A method is described for measuring the operating temperature of photovoltaic cells in an array. Here, use is made of the temperature shift of those optical parameters of the semiconductor which induce a variation in spectral response. This variation is found to be large for wavelengths near the cut-off wavelength. Also described is a method for measuring the voltages that arise at the panel terminals from illumination of a single cell by two monochromatic beams superposed on the solar illumination. C.R.

A82-24183 * Natural sunlight accelerated weathering of photovoltaic modules. G. A. Zerlaut, T. B. Anderson (DSET Laboratories, Inc., Phoenix, AZ), and J. C. Arnett (California Institute of Technology, Jet Propulsion Laboratory, Energy Technology Section, Pasadena, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 751-755. Research sponsored by the U.S. Department of Energy and NASA.

Photovoltaic modules are exposed to the equivalent of ten years of sunlight aging in an accelerated exposure testing and evaluation program, the objective being to determine the long-term durability characteristics of flat plate modules in comparatively short periods of time. The modules are illuminated with concentrated sunlight in a large, sun-tracking, Fresnel-reflecting solar concentrator. The effects of the accelerated exposure are assessed by performing periodic visual inspections and electrical measurements. It is found that field-experienced failure modes are duplicated, that acceleration factors of 6x to 8x are readily attainable, and that the test method is feasible as a predictive tool for photovoltaic module lifetime durability. C.R.

A82-24185 Surface properties of Cu/2-x/S and its influence on the performance of frontwall Cu/2-x/S-CdS thin film solar cells. F. Pfisterer, B. W. Schock, and J. Wörner (Stuttgart, Universität, Stuttgart, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 762-766. 6 refs.

For obtaining optimal efficiencies and high stability of Cu(2-x)S-CdS solar cells, a post-dipping treatment is found to be necessary. The principal features of this treatment are the production of an elemental copper layer on the surface of the cell and the subsequent oxidation of this layer to form a p(+)-Cu2O-layer that acts as a window layer, thereby preventing surface recombination losses. The formation and proper operation of this surface layer is investigated by various methods, among them measurements of the spectral sensitivity, surface potential stoichiometry of the Cu(2-x)S-layer, electron beam induced current, and Auger-depth profiling. C.R.

A82-24186 An EBIC study of the CdS-Cu2S photovoltaic cell. G. J. Russell, S. Oktik, and J. Woods (Durham, University, Durham, England). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 767-771. 7 refs.

Layers of copper sulfide are grown topotaxially on sulfur faces of single crystals of cadmium sulfide using a plating solution containing cuprous ions. The chosen plane corresponds to the preferred orientation of the surface of grains in the evaporated films used in large area devices. With single crystals, the complexities associated with grain boundaries can be eliminated and it becomes possible to investigate more closely the effects of other crystallographic features on cell performance. This is done using a scanning electron microscope in the electron beam induced current mode. C.R.

A82-24187 Transparent, conductive layers of sprayed indium tin oxide in backwall Cu2S-CdS cells. C. Gril, R. Pommier, J. Marucchi, H. Luquet, M. Perotin, O. Maris, and M. Savelli (Montpellier II, Université, Montpellier, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 772-776.

Results obtained from experiments on the transparency and square resistance of a layer of indium tin oxide are reported. The variations in transparency and square resistance with the thickness of the layer are demonstrated. The influence of this transparency and resistance on cell efficiency is computed, and the thickness required to minimize the losses introduced by the indium tin oxide layer is deduced. C.R.

A82-24189 CdZnS-Cu2S thin film solar cells. S. Martinuzzi, F. Z. Nataren, D. Vassilevski, B. Bouchikhi (Aix-Marseille III, Université, Marseille, France), M. Cadene, M. Moutaki, and M. Rolland (Montpellier II, Université, Montpellier, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 782-786. 7 refs. Commission of the European Communities Grant No. 431-78-1-ESF.

Ternary layers of CdZnS are made through single source evaporation of solid solutions and coevaporation. Photocells are then made with these layers by a solid-state reaction with CuCl. It is noted that the observed photovoltage increases may be explained by an increase in the barrier height. The photocurrent values obtained for CdS-Cu2S cells are conserved up to ZnS concentrations of about 8 percent. C.R.

A82-24190 Cu2S/Zn/x/Cd/1-x/S heterojunction solar cells formed on sprayed Zn/x/Cd/1-x/S films. N. A. Reshamwala, W. B. Hsu, L. C. Burton (Virginia Polytechnic Institute and State University, Blacksburg, VA), and V. P. Singh (Photon Power, Inc., El Paso, TX). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 787-792. 10 refs.

Zn(x)Cd(1-x)S films (x greater than or equal to zero and less than or equal to one) are deposited on glass and tin oxide/glass substrates. The film composition is nominally the same as that of the spray solution. The films are found to have preferred C-axis orientations, with lattice parameter, resistivity and band gap variations similar to those of evaporated ZnCdS films. Wet and dry processed Cu2S/ZnCdS junctions are fabricated. Open circuit voltages of more than 0.6 V are obtained with x greater than about 0.15, the maximum value measured being 0.75 V. C.R.

A82-24191 Heterojunction energy band lineups in Cd/1-x/Zn/x/S/Cu2S solar cells. R. Bennaceur, R. B. Hall, and A. Rothwarf (Delaware, University, Newark, DE). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 793-797. 11 refs. Research supported by the U.S. Department of Energy.

A simple method of calculation is used in determining the energy-band lineups in the Cd(1-x)Zn(x)S/Cu2S junction. Since the Cu2S has a complicated structure, the experimental value of delta E sub c for CdS/Cu2S is used. It is noted that for other compounds, such as Cd(1-x)Zn(x)S/InP, the value of delta E sub c can be calculated; in addition, the effect of the dipole layer for different orientations of the interface can be evaluated. It is also shown that delta E sub c = 0 for x values between 20 and 40% corresponding to the maximum value of the open-circuit voltage with no decrease in the short-circuit current density. Other factors, such as resistivity associated with introducing high concentrations of zinc, can affect solar cell parameters and therefore the overall efficiency. C.R.

A82-24192 Integrated Cu/x/S-CdS thin film solar cell panels with higher output voltages. W. Arndt, G. Bilger, F. Pfisterer, H. W. Schock, J. Woerner, and W. H. Bloss (Stuttgart, Universitat, Stuttgart, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 798-802. 6 refs. Bundesministerium fur Forschung und Technologie Contract No. ET-4045-B; Commission of the European Communities Grant No. ESC-R-003-D.

Large-area production of solar cell modules is made possible by applying integration techniques to thin film Cu(x)S-CdS solar cells. It is noted that integrated modules with output voltages matched to various loads can be realized on a single substrate covered by a single front glass with an integrated front contact. The problem of hermetic sealing can thus be easily solved. It is thought that the thin film modules will be very reliable. Two different types of modules, both having outer dimensions of 29.5 x 14.5 sq cm, are fabricated. The first is made up of 8 cells connected in series with an output current of 0.5 A at 2.8 V; the other comprises 18 cells with an output current of 0.2 A at 6 V, related to AM 1.5 illumination (85 mW/sq cm). C.R.

A82-24194 Hydrogenated a-Si multi-junction solar cells and interference effects in the spectral response. M. Ondris and W. den Boer (Delft, Technische Hogeschool, Delft, Netherlands). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 809-814. 9 refs.

Hydrogenated amorphous silicon multijunction solar cells con-

sisting of stacked p-i-n cells are fabricated. The individual cells are connected in series by means of very thin, highly doped p(+)-n(+) a-Si:H tunnel junctions. The cells are illuminated through a thin semitransparent metal layer acting as a Schottky barrier diode with an upper undoped a-Si:H layer in the case of Au, or as an ohmic contact with a negative barrier in the case of Mg. Highly reflective back contacts are used. It is found that a higher number of stacked cells does not result in higher conversion efficiencies. The open circuit voltage of n stacked cells is nearly equal to n times the open circuit voltage of one cell. Conversion efficiencies of 4% at 80 mW/sq cm sunlight are obtained for single and stacked p-i-n structures. C.R.

A82-24197 Electrical properties of hydrogenated amorphous Si/1-x/Ge/x/ alloys. N. Van Dong, T. H. Danh, and J. Y. Le Ny (Commissariat à l'Energie Atomique, Laboratoire de Physique des Matériaux, Gif-sur-Yvette, Essonne, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 830-834. 5 refs.
Research supported by the Commissariat à l'Energie Solaire.

A82-24198 Amorphous Si/1-x/Ge/x/ for high performance solar cell. G. Nakamura, K. Seto, Y. Yukimoto, and K. Shirahata (Mitsubishi Electric Corp., Itami, Japan). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 835-839. 6 refs.

It is noted that the optical gap energy can be controlled in the range between 1.95 eV and 1.14 eV by adding Ge to a-Si:H during the deposition process. As the Ge content in the film increases, however, the photoconductivity and carrier mobilities decrease. A preliminary study is carried out on the cell performance of various structures using an a-SiGe:H film. Spectral response at a wavelength region longer than about 0.6 micron is found to increase in the cells using the a-SiGe:H film. C.R.

A82-24199 Can recombination via interfacial states in MIS solar cells be of advantage. P. T. Landsberg and C. M. H. Klimpke (Southampton, University, Southampton, England). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 846-850. 12 refs.

It is noted that, in an MIS p-type solar cell with donor surface states, loss of photogenerated carriers can occur by band-band recombination via surface states. Depending on the thickness of the insulating layer, however, electrons captured by the surface states may also tunnel into the metal, thereby adding to the light-induced current. A subtle balance therefore exists between the adverse and beneficial effects of the capture of electrons by surface states. This balance is analyzed. C.R.

A82-24201 Efficient solar cells on polycrystalline and highly defected substrates using ion sputtered indium tin oxide. A. P. Genis, C. Osterwald, P. Smith, R. Singh, J. E. Mahan, J. B. DuBow (Colorado State University, Fort Collins, CO), and D. Mills (Hewlett Packard Corp., Loveland, CO). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 856-862. 17 refs.

Indium tin oxide (ITO)/silicon solar cells of practical size (approximately 4 sq cm) and efficiency (more than 11% total area) are fabricated using an optimized ion beam milling/sputter deposition and low pressure oxide growth process. Results for a single crystal silicon substrate and four possibly low-cost polycrystalline substrates are compared. Photovoltaic performance parameters of cells formed on the best polycrystalline material are found to be essentially identical to those of a representative single crystal device. C.R.

A82-24203 Application of amorphous silicon nitride for MIS/inversion layer solar cells. R. Hezel, R. Schörner, and T. Meisel (Erlangen-Nürnberg, Universität, Erlangen, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 866-870. 15 refs.

CVD Si-nitride is shown to exhibit outstanding properties as transparent dielectrics for MIS/inversion layer solar cells. Advantages include a very high density of fixed positive interface charges up to 7 x 10 to the 12th per sq cm, absolute stability up to the nitride deposition temperature of 640 C, low density of fast interface states, and good AR coating with easily adjustable properties. MIS/IL solar cells with AM1 efficiencies of 15% and excellent UV sensitivity are obtained without optimizing the MIS contact and grid structure, and it is concluded that the CVD Si-nitride represents a promising dielectric for the fabrication of MIS/IL solar cells with high efficiency and long term stability for single crystalline and polycrystalline silicon. D.L.G.

A82-24204 Properties of CdSe-MIS solar cells. E. Rickus and D. Bonnet (Battelle-Institut, Frankfurt am Main, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 871-875. Research sponsored by the Bundesministerium für Forschung und Technologie and Commission of the European Communities.

It is noted that, as evidenced from scanning electron microscopy and X-ray goniometer measurements, the short-circuit current denisty of CdSe-MIS cells is strongly influenced by the crystallographic properties of the CdSe layer. Spectral response measurements demonstrate that misorientations lead to a reduced collection efficiency of minority carriers. At the present stage of development, efficiencies near 4% can be realized under AM1 conditions using very simple, not-yet-optimized ZnS antireflection coatings. The extremely thin MIS structure permits cells to be fabricated with low material consumption; efficiencies of 9 to 10% should be possible with further improvements. C.R.

A82-24205 Evaluation of electrodeposited cadmium telluride solar cells. B. M. Basol, O. M. Stafsudd (California, University, Los Angeles, CA), R. L. Rod, and E. S. F. Tseng (Monosolar, Inc., Santa Monica, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980.
Dordrecht, D. Reidel Publishing Co., 1981, p. 878-881. 7 refs.
Contracts No. DE-AC04-79ET-23008; No. XS0-9152-1.

An evaluation is made of Schottky barrier solar cells formed on electrochemically deposited n-CdTe films. The important electrodeposition process variables, that is, tellurium concentration in the electrolyte and the deposition rest potential, are optimized for best solar cell operation. The solar cell parameters for the devices made on as-deposited films are as follows: short-circuit current density, 6 mA/sq cm; open-circuit voltage, 0.57 V; and fill factor, 0.6 (under 100 mW/sq cm illumination). Minority carrier diffusion length in these films is found to be 0.05-0.1 micron. A brief heat treatment in air of the CdTe films greatly improves the solar cell parameters. Cells with efficiencies of the order of 6% are obtained on such films. A larger diffusion length is shown to underlie this improvement. C.R.

A82-24206 Theoretical and experimental study of quantum and energy conversion efficiency in CdTe p-n junctions. D. Lincot, M. Barbe, G. Cohen Solal, and Y. Marfaing (CNRS, Laboratoire de Physique des Solides, Meudon, Hauts-de-Seine, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 882-886. 8 refs.

The quantum efficiency in CdTe p-n junction is calculated taking into account realistic electrical parameters. Experiments are in agreement with computations and show quantum efficiencies as high as 75% without antireflecting coating. The diode dark current is predominantly due to generation recombination in the space charge layer and increases in very shallow junctions. Conversion efficiency is presently limited by surface recombination velocity and low surface doping which leads to surface voltage drops and voltage dependent photocurrent. (Author)

A82-24207 Solar cells based on indium phosphide. N. M. Pearsall, T. J. Coutts, and E. Don (Newcastle-upon-Tyne Polytechnic,

Newcastle-upon-Tyne, England). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 887-891. 8 refs.

The fundamental physics of solar cells based on the nearly ideal solar material indium phosphide (InP) is discussed. The feasibility of sputter deposition of n-type window layers in connection with a program on all sputtered CdS/Cu2S cells is demonstrated. It is pointed out that, in contrast to the InP/CdS combination, there are no obvious reasons for expecting high efficiencies for the ITO/InP device. However, AM1.5 efficiencies of nearly 8% are reported, and it is noted that considerable progress has been made in characterizing the device. C.R.

A82-24208 n ITO spray/p InP solar cells. L. Gouskov, C. Gril, A. Brenac, J. F. Bresse, C. Llinares, E. Monteil, and R. Pommier (Montpellier II, Université, Montpellier, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 892-896. 14 refs. Commissariat à l'Energie Solaire Contract No. 79-132.

Solar cells are prepared by the fabrication method of ITO spray/InP p heterojunctions. Solar power conversion efficiency reaches 10 percent under AM1 conditions on 20 sq mm areas. Two p-type substrates are studied, with heat results obtained using the less doped InP, although the back contacts on the material are not perfectly controlled. The ITO-InP interface is investigated by EBIC profile measurements, and the junction is not localized at the metallurgical interface, but is around 0.8 micron deeper into InP. I-V measurements versus temperature show that two transport processes are competitive, and results agree with the proposed model of buried homojunction. D.L.G.

A82-24210 Characterization of n-CdS/p-Si heterojunction solar cells. L. De Angelis, F. Galluzzi, G. Maletta, E. Scafè, and R. Tomaciello (ASSORENI, Laboratorio di Ricerche di Base, Rome, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 906-910. 5 refs.

Electric and photoelectric characteristics of n-CdS/p-Si devices at various temperatures and illumination levels are reported. Heterojunctions between silicon and transparent semiconductors appear to be promising alternative solar cells, with n-CdS/p-Si junctions showing Voc up to 570 mV and overall efficiencies up to 10 percent. The transport mechanism is described as a multistep thermal assisted tunneling, which is unchanged by illumination, and photoresponses show the expected bandpass behavior with internal quantum yields of about 1. D.L.G.

A82-24211 Performance of ultra high efficiency thin germanium p-n junction solar cells intended for solar thermophotovoltaic application. E. S. Vera, J. J. Loferski, M. Spitzer, and J. Schewchun (Brown University, Providence, RI). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 911-919. 14 refs. NSF-Navy-supported research.

The theoretical upper limit conversion efficiency as a function of cell thickness and junction position is calculated for a germanium p-n junction solar cell. The cell structure is intended for solar thermophotovoltaic energy conversion, incorporating minority carrier mirrors and optical mirrors on both the front and back boundaries of the active part of the device. The role of non-ideal optical and minority carrier mirrors, and the effect of resistivity variations are studied. The theoretical efficiency exceeds 15% for an optimal structure 90 microns thick under 25 W/sq cm illumination from a 1500 C thermal source. This upper limit is higher than the calculated limit of 10% to the conversion efficiency of conventional germanium p-n junctions under the same conditions of illumination. D.L.G.

A82-24212 Thermodynamic limitations of direct solar energy conversion. P. Würfel and W. Ruppel (Karlsruhe, Universität, Karlsruhe, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 922-926. 5 refs.

The paper presents an approach to the thermodynamics of radiation, which allows a straightforward and rigorous determination of the upper limit for the efficiency of converting solar energy into electrical energy. Solar energy is first converted into chemical energy of the electron-hole gas by cooling it to room temperature at a constant number of electron-hole pairs. The chemical energy, which is then converted into electrical energy, is not restricted by thermodynamics. The irreversibility of the cooling process limits the AM0 for a single solar cell to a maximum of 0.29 for a bandgap of 1.3 eV, although it can be reduced considerably in more complex systems. D.L.G.

A82-24213 Thermodynamic limits to photovoltaic solar energy conversion efficiency. P. Baruch, C. Picard (Ecole Normale Supérieure, Paris, France), and R. M. Swanson (Stanford University, Stanford, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 927-932. 11 refs. Research supported by the Centre National de la Recherche Scientifique.

A derivation of the Carnot factor is discussed, using a two-level system as a model of a quantum converter. It is shown that in a 4-pi configuration, the thermodynamic limit can be reached in the case of purely radiative recombination. It is also demonstrated that in the usual configuration of a solar cell, a Carnot efficiency can still be used if the hot reservoir temperature is defined as the temperature the electronic population would reach if it were thermally uncoupled from the lattice. The use of simple thermodynamic quantities leads to simple computation of maximum theoretical efficiencies for photovoltaic conversion, and the introduction of source effective temperatures is convenient and allows the isolation of the irreversible processes limiting the efficiency. D.L.G.

A82-24219 Low resistance solar cells for the first Spanish concentrating photovoltaic array. G. L. Araujo, G. Sala, F. Chenlo, E. Sánchez, A. Luque, E. Lorenzo, and J. M. Ruiz (Escuela Técnica Superior de Ingenieros de Telecomunicación, Madrid, Spain). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 960-964. 6 refs.

A two-axis photovoltaic tracking array of 20.8 sq m aperture has been developed, which is equipped with monocrystalline silicon solar cells and hybrid silicone-glass Fresnel lenses, and is capable of yielding 1.5 KW peak under AM1 conditions. It is shown that the use of certain two-level metallization grids reduces the series resistance and improves the performance of concentration of solar cells. The series resistance values of n(plus)p silicon solar cells with a 5 cm diameter and an efficiency of 16.6 percent at AM1 are measured. The 6 C thermal drop between the cell and the cooling element for AM1 irradiance are also measured. D.L.G.

A82-24221 High efficiency large area AlGaAs/GaAs concentrator solar cells. S. Yoshida, K. Mitsui, T. Oda, Y. Yukimoto, and Y. Shirahata (Mitsubishi Electric Corp., LSI Research and Development Laboratory, Itami, Hyogo, Japan). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 970-974. 6 refs.

The design, construction, and performance of a 1 kW AlGaAs/GaAs solar cell array is described, along with problems associated with realization of the array. The array features two panels, each with 90 27 × 27 cm Fresnel lenses above 4 sq cm solar cells. The panels are mounted on a two axes tracking system, and cooling is supplied by an aluminum plate for natural convection. The lenses provide 125 suns concentration for the series-connected cells. The photovoltaics were grown by a liquid phase epitaxial growth technique which produced a 24 sq cm wafer, and a p-n homojunction was formed by diffusing Zn during the p-AlGaAs epitaxial growth. A maximum output of 9.1 W was achieved at 125 suns, and the cells

were soldered to a ceramic base to furnish electrical isolation between the cells and the heat sink. An array power of 977 W was obtained at an efficiency of 14.2%, with losses due to tracking errors and lens-cell misalignment. M.S.K.

A82-24222 Optical characteristics of the dispersion concentrator and its influence on photovoltaic systems. G. Sassi (Milano, Università, Milan, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 981-985.

The realization of an optical dispersion concentrator for splitting solar radiation into the different wavelength components for deposition on solar cells sensitive to the deposited wavelengths is discussed. Problems due to scattering by the splitting and focussing lens are examined, including the distribution of wavelengths at the focal point. The solar cells are then arranged so that the light which strikes them exceed the individual energy gaps. Highest energy densities were found at the periphery of the focal zone, with UV rays striking the center, and the possibility of altering the shape of the focal zone to accord with individual requirements is mentioned. The cells can also be distributed in the focal zone so that series connections of cells responding to the identified wavelengths will produce equal outputs. Linear configurations with same apparatus are noted to necessicate lower concentration ratios for higher utilization, and therefore higher cost. M.S.K.

A82-24223 Automated concentrator cell module assembly. S. Olah and W. Sampson (Applied Solar Energy Corp., City of Industry, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 991-995.

The performance and features of linear concentrator photovoltaic arrays fabricated partially by an automated soldering machine are detailed. Float zone Si cells were mounted in five linear modules each 1.2 m long containing 48 cells. The cell strings were made up of 4 12-cell segments encapsulated in polyvinyl butyral, with two bypass diodes for every segment. An efficiency of 16.4% was achieved at 55 C, and humidity tests showed no performance degradation or cracks in an Al303 coating. The automatic soldering machine comprised a ribbon feeding system, an interconnect punch die, a solar cell feeder and soldering mechanism, a ribbon separation mechanism with cut-off die and outfeed, and a program control. The machine operated with low-line voltage, compressed air, and vacuum, and the processing of the cells is outlined, including cell soldering by a point contact method with a controlled immersion heater. Standardization of cell sizes is recommended to ensure flexibility of cells which can be handled. M.S.K.

A82-24224 Construction and testing of experimental plants using solar cells and concentrators. H. Pfeiffer (Maschinenfabrik Augsburg-Nürnberg AG, Munich, West Germany). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 996-1000. 6 refs. Research supported by the Commission of the European Communities and Bundesministerium für Forschung und Technologie.

A82-24225 Multibandgap cells in a thermophotovoltaic system. F. Demichelis and E. Minetti-Mezzetti (Torino, Politecnico, Turin, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1006-1011. 9 refs. Research supported by Fiat S.p.A.

Designs for a thermophotovoltaic (TPV) converter which employs a Fresnel concentrating lens and a parabolic reflector as a collector are described. Solar radiation is concentrated onto two hollow hemispheres near the focus of two parabolic mirrors where low reradiated levels of the incoming flux are redirected by filters onto different cells. Symmetric coupled differential equations are developed to describe the time-dependence of the TPV converter, which uses multibandgap cells to achieve efficiencies of up to 45%. M.S.K.

A82-24226 Description of a concentrating photovoltaic energy system for Wilcox Memorial Hospital on Kauai. D. Rafinejad (Acurex Corp., Alternate Energy Div., Mountain View, CA). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1012-1015. Research sponsored by the U.S. Department of Energy.

A82-24227 Community television reception centers with solar generator power supplies in Niger - Television retransmitters with alternative energy power supplies in France (Centres de réception communautaire de télévision alimentés par générateurs solaires au Niger - Réémetteurs de télévision alimentés par les énergies nouvelles en France). S. Polgar (TéléDiffusion de France, Montrouge, Hauts-de-Seine, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1018-1022. In French.

A82-24228 Solar cell/battery plants for telecommunication systems in Denmark - Development of a test facility. J. Jensen (Odense, Universitet, Odense, Denmark). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1023-1027. Research supported by the Department of Energy of Denmark; European Economic Community Contract No. 315-78-EEDK.

A82-24229 The 5 kW generator at the Alpine refuge 'Les Evettes' - Operating data. L. Selles (SERI-Ranault Ingénierie, Bois-d'Arcy, Yvelines, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1028-1032. Commission of the European Communities Grant No. 463-78-1-ES-F.

[illegible] components and performance of a remotely sited prototype solar cell power supply for a hotel with no grid connection are detailed. The array provides a peak output of 5 kW at 48-70 V dc and batteries comprising 120 lead-acid elements hold five days of power for nominal use. Power conditioning is accomplished by a 3 kVA inverter equipped with thyristors which perform at 80 percent with a full load and 67 percent at part load. Data recording consisted of 12 channels for irradiance, temperature, current, voltage, power, etc. The cells delivered an average of 28.2 kWh/day minimum in Aug. 1980. The use of voltage matching devices is recommended to increase solar cell efficiency, along with higher battery voltages in the inverter to cope with more widely varying loads. M.S.K.

A82-24230 Optimization of the P.V. array-load energy transfer by means of an electronic adaptator. J. Pivot, J. A. Roger (Lyon I, Université, Villeubanne, Rhône, France), P. Gucher, B. Canut, and E. Descours (Lyon, Facultés Catholiques, Lyon, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1033-1037. Commissariat à l'Energie Solaire Contracts No. 78-03192; No. 78-03292.

Operational characteristics and circuitry of adaptors for direct coupling of photovoltaics to loads are discussed. Direct coupling to load is noted to be the cheapest available method for utilization of solar cell-produced power, and necessitates dc-dc conversion to allow performance of cell modules at optimum levels in matching the load. Adaptors are necessarily powered by the power source, have high reliability in all climates, and respond to photovoltaic curve temperature shifts. A series adaptor is transistorized, with two capacitors charged and discharged in sequence in reference to a load capacitor designed for the required levels, and responding to light flux and cell temperature. A parallel adaptor has a blocking circuit of thyristors and a light flux follower to pilot a driving circuit to fix the working points at maximum power points of the array regardless of temperature and light flux. The series chopper is noted to be effective for powers lower than 1.5 kW. M.S.K.

A82-24231 Interconnection of a photovoltaic power generation system with the grid. R. Corbefin and G. Vacelet (Société Nationale Industrielle Aérospatiale, Paris, France). In: Photovoltaic

Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1038-1040. In French.

Converting photovoltaic system-generated power into a form compatible with grid-furnished power and simultaneously ensuring that maximal power is drawn from the solar system is discussed. A converter is interposed between the solar-derived electricity and the grid lines, allowing the user to apply the power to a load, feed excess power to the grid, and receive power from the grid when the photovoltaic output is too low to fill demand. A dc-ac converter is described, with microprocessor controlled transistorized switching to adapt the solar output to the load amplitude on demand, while maintaining constant voltage. An adaptor allows the converter to take its amplitude, phase, and frequency regulation from the grid, and also assures that power will flow only toward the grid. M.S.K.

A82-24232 Power conditioning unit for photovoltaic power systems. G. Beghin and V. T. Nguyen Phuoc (Précision Mécanique Labinal, S.A., Vanddeuvre, Seine-Saint-Denis, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1041-1045.

Operational features and components of a power conditioning unit for interconnecting solar cell module powers with a utility grid are outlined. The two-stage unit first modifies the voltage to desired levels on an internal dc link, then inverts the current in 2 power transformers connected to a vector summation control to neutralize harmonic distortion up to the 11th harmonic. The system operates in parallel with the grid with extra inductors to absorb line-to-line voltage and phase differences, and permits peak power use from the PV array. Reactive power is gained internally, and a power system controller monitors voltages, frequencies, and currents. A booster preregulator adjusts the input voltage from the array to provide voltage regulation for the inverter, and can commutate 450 amps. A total harmonic distortion of less than 5 percent is claimed, with a rating of 5 kVA, 50/60 Hz, 3-phase, and 4-wire. M.S.K.

A82-24233 New type of transformerless high efficiency inverter. G. J. Naaijer (Laboratoires d'Electronique et de Physique Appliqueé, Limeil-Brévannes, Val-de-Marne, France). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p.1068-1072. Research supported by the Commissariat à l'Energie Solaire.

Inverter architectures are presented which allow economical ac/dc switching for solar cell array and battery power use in domestic and industrial applications. The efficiencies of currently available inverters are examined and compared with a new 2.2 kW transformerless stepped wave inverter. The inverter has low no-load losses, amounting to 200 Wh/24 hr, and features voltage steps occurring 15-30 times/sine wave period. An example is provided for an array/battery/inverter assembly with the inverter control electronics activating or disconnecting the battery subassemblies based on the total number of activated subassemblies in relation to a reference sinewave, and the need to average the battery subassembly discharge rates. A total harmonic distortion of 6 percent was observed, and the system is noted to be usable as a battery charger. M.S.K.

A82-24234 Considerations on the feasibility of A 1 MWp central PV plant to be tied to the European electrical network. P. Bullo, S. Corsi, V. Piazza (Ente Nazionale per l'Energia Elettrica, Direzione Studi e Ricerche, Milan, Italy), G. Emanuele (Phoebus, Catania, Italy), G. Gelli (Officine Galileo S.p.A., Florence, Italy), and M. Giuffrida (Ansaldo Elsag /AE/, Genoa, Italy). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1076-1081. 6 refs.

A functional analysis of an optimized centralized photovoltaic power plant is presented. The incorporation of meteorological data, the anticipation of uneven cell performance, the avoidance of shadowing, and isolation of defective panels by using by-pass diodes are considered. An optical module consisting of a parabolic trough with an aperture of 1.7 m with a focal distance of 750 mm was chosen, with provision made for tracking. The power conditioning unit comprised a dc/ac thyristor converter with natural commutation. Lightning protection is outlined, along with an optimal plant layout. Finally, cost considerations for land and the solar cell modules are discussed, including cost levels required to make the operation of a photovoltaic plant economical. M.S.K.

A82-24235 Thin-film polycrystalline /CdZn/S/Cu2S solar cells of 10% conversion efficiency. R. B. Hall, R. W. Birkmire, J. E. Phillips, and J. D. Meakin (Delaware, University, Newark, DE). In: Photovoltaic Solar Energy Conference; Proceedings of the Third International Conference, Cannes, France, October 27-31, 1980. Dordrecht, D. Reidel Publishing Co., 1981, p. 1094-1096. 5 refs. Research supported by the U.S. Department of Energy.

An important limitation on the efficiency of CdS/Cu2S solar cells is the open circuit voltage attainable with the CdS/Cu2S heterojunction. The electron affinity mismatch between CdS and Cu2S of approximately 0.2 eV limits the achievable open circuit voltage to about 0.5 V. A modified heterojunction using a mixed Cd-Zn sulfide that has been proposed as a means of achieving an open circuit voltage of about 0.7 V is tested. C.R.

A82-24293 The effects of elevated temperature exposure on the compatibility of glycol solutions with metals used in solar absorbers. E. F. Smith, III and E. Davis (Olin Metals Research Laboratories, New Haven, CT). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 18 p. 6 refs. Research supported by the International Copper Research Association.

A laboratory study was conducted to evaluate the corrosion compatibility of various metals with water-glycol mixtures at temperatures reached in a stagnating solar collector. This initial scoping study examined the corrosion response of aluminum, copper, low carbon steel and a stainless steel alloy after elevated temperature exposure to a 50 v/o solution of reagent grade glycol in water. The test procedure included exposure to both liquid and vapor phases for periods of up to thirty days. These initial tests were performed to establish baseline performance data for both propylene and ethylene glycol solutions. In future studies, this baseline will be used to evaluate the effectiveness of various commercial additive packages to the water-glycol mixtures. (Author)

A82-24294 The effect of degradation of glycols on corrosion of metals used in non-concentrating solar collectors. J. A. Beavers and R. B. Diegle (Battelle Columbus Laboratories, Columbus, OH). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 24 p. 8 refs. Contract No. DE-AC04-79CS-10510.

Chemical degradation of aqueous ethylene glycol and propylene glycol solutions has been investigated at 100 and 180 C in solutions containing metals currently considered for use in nonconcentrating solar collectors, namely, copper, steel, and aluminum. It is shown that degradation of ethylene glycol and propylene glycol during simulated solar collector operating conditions is catalyzed by the presence of metals, resulting in the formation of acidic byproducts and a reduction of pH. This, in turn, accelerates corrosion of the metals studied. It is concluded that corrosion inhibitors and buffering agents are necessary in order to attain a reasonable design life of 10 to 20 years for nonconcentrating solar collector systems. V.L.

A82-24298 * Development of an accelerated reliability test schedule for terrestrial solar cells. J. W. Lathrop and J. L. Prince (Clemson University, Clemson, SC). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 20 p. Research sponsored by the U.S. Department of Energy and NASA.

An accelerated test schedule using a minimum amount of tests and a minimum number of cells has been developed on the basis of stress test results obtained from more than 1500 cells of seven different cell types. The proposed tests, which include bias-temperature, bias-temperature-humidity, power cycle, thermal cycle, and thermal shock tests, use as little as 10 and up to 25 cells, depending on the test type. V.L.

A82-24299 * Atmospheric corrosion model and monitor for low cost solar arrays. D. H. Kastle, F. B. Mansfeld, S. L. Jeanjaquet, and M. Kendig (Rockwell International Science Center, Thousand Oaks, CA). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 13 p. 5 refs. Research sponsored by the U.S. Department of Energy; Contract No. JPL-954739.

An atmospheric corrosion model and corrosion monitoring system has been developed for low cost solar arrays (LSA). The corrosion model predicts that corrosion rate is the product of the surface condensation probability of water vapor and the diffusion controlled corrosion current. This corrosion model is verified by simultaneous monitoring of weather conditions and corrosion rates at the solar array test site at Mead, Nebraska. (Author)

A82-24589 * Forced convection heat transfer for two-phase helical flow in a solar receiver. J. R. Dunn and F. N. Vafaie (Texas Tech University, Lubbock, TX). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/HT-13.* 9 p. 9 refs. Members, $2.00; nonmembers, $4.00. Research supported by the U.S. Department of Energy.

The heat transfer characteristics of a single-tube, helically coiled receiver for a concentrating solar collector are presented. Heat transfer coefficients were measured for single- and two-phase water-stream flow in a helical coil subjected to radiant heating for a range of flow conditions and radiant flux levels. Results are presented for both the local and average heat transfer coefficients in several flow regimes and the results correlated with non-dimensional, geometric, fluid, and flow parameters. (Author)

A82-24605 # Method of testing solar collectors for determination of heat transfer parameters. A. R. Shouman and I. A. Tag (New Mexico State University, Las Cruces, NM). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-2.* 5 p. 6 refs. Members, $2.00; nonmembers, $4.00. Research supported by the University of Petroleum and Minerals.

An experimental program is developed for including the temperature measurements of the absorber plate at the fluid inlet and outlet locations for inclusion in theoretical analyses of the heat transfer parameters of a flat plate solar collector. The steady-state one-dimensional equation for the fluid temperature, the actual plate temperature for a uniform flow collector, and a characteristic temperature for a uniform flow in the collector tubes are considered. The Hottel-Whillier, and Bliss solution (1958, 1959) is shown to neglect axial conduction in the fluid and the receiver, and a method is found for correct calculation for the effective transmittance-absorptance product, which is crucial for determining the efficiency of the collector. End losses are also observed to be significant, and it is recommended that measurements of inlet and outlet temperatures be performed in order to separate the heat transfer parameters. M.S.K.

A82-24606 # On reducing convective losses from cover glazings of solar thermal collectors. P. Raghuraman and D. Kon (MIT, Lexington, MA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-3.* 8 p. 21 refs. Members, $2.00; nonmembers, $4.00. Research supported by the U.S. Department of Energy.

Convective heat losses from cover glazings of solar thermal collectors are reduced by forming perpendicular crisscross rectangular grooves on the glazing which cause the air flow to form recirculating zones in the grooves. Experiments on the effects of varying groove geometry show that the cover glazing convective heat transfer coefficient can be reduced by a factor of four or better. Results of the experimental and analytical work and a description of the design considerations in optimizing the groove geometry are presented. (Author)

A82-24607 # Heat transfer characteristics of a back-corrugated absorber surface for solar air collectors. K. A. Shockey, J. T. Pearson, and D. P. DeWitt (Purdue University, West Lafayette, IN). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-5.* 6 p. 8 refs. Members, $2.00; nonmembers, $4.00. Contract No. EM-78-C-04-5366.

The present study experimentally examines a back-corrugated absorber-convector comprised of a rectangularly corrugated plate attached to the back side of a flat absorber plate with a high temperature, high strength adhesive. The upper surface is subjected to a heat flux from a blanket-type electric heater simulating solar irradiation. The corrugated plate configuration creates two parallel airflow channel types. The two channels have different geometries and, therefore, may have different heat transfer characteristics. An apparatus was designed to determine the local convective heat transfer coefficients along each of the channels. The results show that the back-corrugated absorber-convector has much better thermal performance than the simple flat-plate absorber-convector, mainly because of the increased connective heat transfer area. (Author)

A82-24608 # On the weathering of thin plastic films. H. Cheng and R. B. Bannerot (Houston, University, Houston, TX). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-6.* 9 p. 11 refs. Members, $2.00; nonmembers, $4.00.

Results and procedures of an ongoing testing program to determine the weatherability of thin film plastic covers for use in flat plate solar collectors are reported. The program was designed to isolate the effects of the environment, insolation, i.e. UV radiation, thermal radiation, and mechanical forces. Actual outdoor operating conditions were used to avoid inaccuracies previously obtained using accelerated conditions or thick plastic sheets. Solar transmittance of collector candidate materials was determined from radiance monitoring, angle of incidence, spectral measurements, and consideration was given to synergistic effects of various weathering mechanisms. The design and fabrication of outdoor testing apparatus are described, with examples of trials of a 0.025 mm sheet of fluorinated copolymer FEP and a 0.1 mm thick sheet of polyvinyl fluoride. Samples were cut every month and analyzed. Thermal effects were found to contribute 80% of the transmittance degradation, with summer degradation showing the highest rates. UV radiation was found to have little effect on degradation rates. M.S.K.

A82-24609 # Actual versus predicted performance of an active solar heating system - A comparison using FCHART 4.0. P. E. Wetzel (Automation Industries, Inc., Silver Spring, MD). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-7.* 9 p. Members; $2.00; nonmembers, $4.00. Contract No. DE-AC01-79CS-30027.

The performance of an active solar heating system added to a house in Denver, CO was compared with predictions made by the FCHART 4.0 computer program. The house featured 43.23 sq m of collectors with an ethylene-glycol/water heat transfer fluid, and a 3.23 cu m storage tank. The house hot water was preheated in the storage tank, and home space heat was furnished whenever the storage water was above 32 C. Actual meteorological and heating demand data were used for the comparison, rather than long-term averages. Although monthly predictions by the FCHART program were found to diverge from measured data, the annual demand and supply predictions provided a good fit, i.e. within 9%, and were within 1% of the measured solar energy contributed to storage. M.S.K.

A82-24610 # Passive cooling measurements for a concentrating photovoltaic array. F. K. Deaver (Arkansas, University, Fayetteville, AR) and M. W. Edenburn (Sandia National Laboratory, Albuquerque, NM). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-10.* 5 p. Members, $2.00; nonmembers, $4.00. Research supported by the U.S. Department of Energy.

Solar cells in a concentrating photovoltaic array absorb heat that must be removed. One method is to use a finned aluminum heat exchanger whose modeling requires estimating the coefficient of heat transfer from fins to surroundings; transfer depends on such parameters as wind speed and direction, and exchanger design. A transient analytical model has been constructed and applied to experimental data. Coefficients of heat transfer were calculated and correlated with wind speed and direction, which appear to have a definite effect on the overall coefficient. The transient model and

apparent relationships between wind speed and convective coefficients are described. (Author)

A82-24611 # Systematic rotation and receiver location error effects on parabolic trough annual performance. G. W. Treadwell and N. R. Grandjean (Sandia National Laboratory, Albuquerque, NM). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-12.* 5 p. 7 refs. Members, $2.00; nonmembers, $4.00.

The effects of systematic geometrical design errors and random optical errors on the accuracy and subsequent economic viability of solar parabolic trough concentrating collectors were studied to enable designers to choose and specify necessary design and material constraints. A three-dimensional numerical model of a parabolic trough was analyzed with the inclusion of errors of pointing and mechanical deformation, and data from a typical meteorological year. System errors determined as percentage standard deviations provided the range of a study for systematic rotation and receiver location errors. The two types of errors were found to produce compounded effects. It is concluded that the designer must choose performance levels which take into account existence of errors, must know to what level the errors can be eliminated and at what cost, and should make provisions for monitoring the day-to-day on-line focus of the troughs. M.S.K.

A82-24612 # Design, fabrication, and evaluation of an innovative woven-screen solar collector. J. A. Bryant, R. R. Clark (New Mexico State University, Las Cruces, NM), and I. A. Tag (Oak Ridge National Laboratory, Oak Ridge, TN). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-13.* 3 p. 6 refs. Members, $2.00; nonmembers, $4.00.

A low-cost woven screen solar air collector is described, and performance and costs are compared with conventional flat-plate collectors. A wire screen mesh is mounted in the center of a collector, between the glazing and the insulated back surface, and PVC pipe inlets allow air flow into the collector from above the mesh. A central outlet duct receives the heated air beneath the mesh. A 16.3 sq ft collector features an efficiency of nearly 50%, with a pressure drop of 0.5 in. at a mass flow rate of 279.4 lbm/hr. A lifetime of 5-7 yr is expected with a unit which costs $150, with a per foot cost of $9.10/sq ft as compared with currently marketed solar air collectors at $15.90/sq ft. The lower pressure drop is noted to allow lower power requirements for a circulating fan. M.S.K.

A82-24613 # The effect of nonuniform fluid flow distribution on the thermal performance of solar collector. J. P. Chiou (Detroit, University, Detroit, MI). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-14.* 9 p. 20 refs. Members, $2.00; nonmembers, $4.00.

The effect of flow nonuniformities due to pipe clogging, misplaced pipe headers, and poor design of solar flat plate collectors is considered analytically for 16 different flow maldistributions. The inlet and outlet tubes are assumed to be connected to headers on the flat plates, resulting in a parallel flow in the fluid circuit. Governing equations are defined for the absorber plate and heat transfer fluid, along with suitable boundary conditions, and numerical solutions are obtained. Collector efficiency is determined for uniform and nonuniform flow condition to set a collector efficiency deterioration factor. The effect of longitudinal heat conduction was found to be negligible, and flow nonuniformities were observed to always cause performance deterioration in flat plate collectors, ranging from 2-20% of the thermal efficiency, and depending on the pattern of flow disturbance. M.S.K.

A82-24614 # Thermal analysis of a solar pond power plant operated with a direct contact boiler. A. Sonn and R. Letan (Negev, University, Beersheba, Israel). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-15.* 10 p. 11 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Ministry of Energy of Israel.

A solar pond power plant operated with a direct contact boiler was thermally analyzed. A binary cycle system of concentrated brine, and an organic working fluid were considered. Brine temperature of 80 C, condensation at 30 C, a 75 percent efficient turbine, and 70 percent efficient pumps were specified for the analysis. The current study involved six working fluids: butane, pentane, hexane, and freons R113, R114, R12. Each of these fluids exhibited a maximum efficiency of the system at characteristic operating conditions of the boiler. The system efficiency increased as the boiler pressure approached that of the pond. Net electrical outputs of 7-9 percent of the heat inputs were obtained for the low pressure fluids, such as pentane, hexane, and R113. Gravity flow of brine to boiler increased these values to 8-11 percent. Solute losses in brine by direct contact in boiler were estimated for pentane, as 125 kg per year per sq km of pond, or 63 kg/MWe-year. Similar orders of magnitude are obtained for the other fluids. (Author)

A82-24615 # Effects of friction and extraction on the stability of solar ponds. Y. S. Cha, W. T. Sha (Argonne National Laboratory, Argonne, IL), and S. L. Soo (Illinois, University, Urbana, IL). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-16.* 10 p. 23 refs. Members, $2.00; nonmembers, $4.00. Contract No. W-31-109-eng-38.

Theoretical stability analyses are compared with experimental and theoretical results on the effects of internal barriers and stratification on solar pond performance. Stability criteria are defined, and the use of walls in the gradient zone are demonstrated to permit lower salt concentrations with no loss in performance, although stable operating ranges were close to unstable levels. Additionally, the use of perforated walls is shown to increase internal friction, assuring a stable nonconvective gradient layer. The feasibility of withdrawal of heated liquid from the bottom layer is proven to not damage the longitudinal stability as long as the rate of withdrawal is within the ranges of laminar motion. An example is provided for the case of withdrawal in the absence of solar input, and it is concluded that the introduction of perforated boundaries may permit the operation of solar ponds without salt gradients. M.S.K.

A82-24616 # The potential economic benefit of using parabolic trough collectors to supplement power cycle boilers. W. P. Schimmel, Jr. and L. L. Lukens (Sandia National Laboratory, Albuquerque, NM). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-17.* 7 p. 9 refs. Members, $2.00; nonmembers, $4.00. Research supported by the U.S. Department of Energy.

An economic analysis is presented for a combined parabolic trough solar/fossil fuel hybrid power plant. Applications are considered for investor-owned utilities and industries with stockholders and bond purchasers. Annual levelized revenues are calculated, based on the capital cost of equipment, annual operations and maintenance, and a rising cost of fossil fuel. The units of heat are considered as equal in value from each source, and project return on equity for an American Southwest user of the hybrid systems are calculated to show an annual project return on equity of 21% for a utility and 25% for an industry in 1985. Analysis of the total fuel replaced by a solar reheat system for a gas-fueled boiler system shows that a 20% reduction in fuel costs can be obtained by a 10% increase in the plant costs to include the solar reheat system furnishing low-temperature heat in 1985. M.S.K.

A82-24617 # Comparison of test results for flat plate, transpired flat plate, corrugated, and transpired corrugated solar air heaters. S. J. Rhee and D. K. Edwards (California, University, Los Angeles, CA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-18.* 8 p. 26 refs. Members, $2.00; nonmembers, $4.00. Contract No. DE-FG04-77CS-34088.

Results from tests to demonstrate technical improvements from transpiring and/or corrugating a selective black absorber plate solar air collector are reported. A literature review is presented, and the specific working components of transpired and nontranspired flat and corrugated absorbers are provided, including transpiration through slots, a microperforated plate, a corrugated plate, and a transpired, slotted, corrugated plate. Inlet and outlet temperatures were monitored, and inlet air was controlled, with trials covering temperatures of 38, 60, 82, and 104 C to test the effect of maintaining the fluid temperature close to the collector temperature. No differences were observed in running the collectors with corrugations vertically instead of horizontally, and the collector with

transpiration through slots was found to display the lowest pressure drop. M.S.K.

A82-24620 * // Rankine engine solar power generation. I - Performance and economic analysis. A. A. Gossler and J. E. Orrock (Honeywell Technology Strategy Center, Roseville, MN). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-22.* 5 p. 6 refs. Members, $2.00; nonmembers, $4.00. NASA-supported research.

Results of a computer simulation of the performance of a solar flat plate collector powered electrical generation system are presented. The simulation was configured to include locations in New Mexico, North Dakota, Tennessee, and Massachusetts, and considered a water-based heat-transfer fluid collector system with storage. The collectors also powered a Rankine-cycle boiler filled with a low temperature working fluid. The generator was considered to be run only when excess solar heat and full storage would otherwise require heat purging through the collectors. All power was directed into the utility grid. The solar powered generator unit addition was found to be dependent on site location and collector area, and reduced the effective solar cost with collector areas greater than 400-670 sq m. The sites were economically ranked, best to worst: New Mexico, North Dakota, Massachusetts, and Tennessee. M.S.K.

A82-24621 // Rankine engine solar power generation. II - The power generation module. W. D. Batton and R. E. Barber (Barber Nichols Engineering Co., Arvada, CO). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-23.* 6 p. 7 refs. Members, $2.00; nonmembers, $4.00.

The characteristics and performance of a solar flat plate collector powered low temperature power generation module (PGM) funded by NASA are described. The PGM uses a halogen refrigerant as a working fluid, which is pumped from a reservoir to a chamber where it is heated by exchangers filled with an ethylene-glycol fluid which has gained thermal energy from a collector array. The heated refrigerant is allowed to expand through turbine blades and exits through a regenerative heater to condensation into the original well. The PGM was built mainly from off-the-shelf components, except for the turbo-gearbox, which was fabricated specifically for the PGM and attains the design goal of 80% efficiency, producing 13.8 kW at the design point. The components and controls are detailed, including start-up and shutdown, and safety procedures. The testing program is outlined, and 6000 hours of operating experience has resulted in a 7.2% efficiency. M.S.K.

A82-24622 * // Ceramic technology for solar thermal receivers. A. A. Kudirka and R. H. Smoak (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-24.* 9 p. 10 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the U.S. Department of Energy and NASA.

The high-temperature capability, resistance to corrosive environments and non-strategic nature of ceramics have prompted applications in the solar thermal field whose advantages over metallic devices of comparable performance may begin to be assessed. It is shown by a survey of point-focusing receiver designs employing a variety of ceramic compositions and fabrication methods that the state-of-the-art in structural ceramics is not sufficiently advanced to fully realize the promised benefits of higher temperature capabilities at lower cost than metallic alternatives. The ceramics considered include alumina, berylia, magnesia, stabilized zirconia, fused silica, silicon nitride, silicon carbide, mullite and cordierite, processed by such methods as isostatic pressing, dry pressing, slip casting, extrusion, calendaring and injection molding. O.C.

A82-24623 // Assessment of generic solar thermal systems for large power applications. W. J. Apley and S. P. Bird (Battelle Pacific Northwest Laboratories, Richland, WA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-25.* 9 p. 12 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the U.S. Department of Energy.

An assessment and ranking of solar thermal power systems capable of producing over 10 MWe is presented as a basis for decisions by the DOE on which systems to continue funding. The systems were organized generically into two-axis tracking, one-axis tracking, and nontracking systems. Configurations were ranked on the basis of lowest energy cost. Some form of concentration was found to be necessary for stationary collectors to achieve acceptable conversion efficiencies. Plant sizes of 50, 100, and 200 MWe, were analyzed with the energy output coupled to a plant capacity factor. Estimates included requirements of grid interconnection, strictly electric output, and using Barstow, CA climatological data summaries. The point focus central receiver with Rankine cycle displayed the highest ranking for electricity costs coupled with plant capacity factor, while the point focus distributed receiver with either Rankine or Brayton cycles were highest with no storage. M.S.K.

A82-24624 * // Comparison of electrochemical and thermal storage for hybrid parabolic dish solar power plants. H. L. Steele and L. Wen (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-27.* 8 p. 12 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the U.S. Department of Energy and NASA.

The economic and operating performance of a parabolic point focus array of solar electricity generators combined with either battery or thermal energy storage are examined. Noting that low-cost, mass-producible power generating units are under development for the point focus of distributed dishes, that Zn-Cl battery tests will begin in 1981 and a 100 kWh Na-S battery in 1983, the state of thermal storage requires acceleration to reach the prototype status of the batteries. Under the assumptions of 10,000 units/yr with an expected 30 yr lifetime, cost comparisons are developed for 10 types of advanced batteries. A 5 MWe plant with full thermal or 80% battery storage discharge when demand occurs in conditions of no insolation is considered, specifically for Fe-Cr redox batteries. A necessity for the doubling of fuel prices from 1980 levels by 1990 is found in order to make the systems with batteries economically competitive. M.S.K.

A82-24625 // Optimization of a hybrid solar thermal power system. R. E. Irwin, D. A. Rodriguez, and R. L. Pons (Ford Aerospace and Communications Corp., Aeronutronic Div., Newport Beach, CA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-28.* 6 p. 6 refs. Members, $2.00; nonmembers, $4.00.

An optimized collector area/storage medium is modelled for applications of a 1 MWe solar electric plant for a prototype Community Solar Experiment power module. The battery storage system considered is the lead-acid and sodium-sulfur batteries, and an annualized capacity factor of unity is set as the goal for the combined system, including supplemental fuel burning. A total of 90 parabolic point focus dish concentrators were calculated to be necessary to achieve the unity goal with storage to maintain peak power through the night. A necessity of storing summer derived energy for the winter is noted, as is a substantial unit cost of power delivery reduction through the use of sodium-sulfur batteries. Site dependent studies were carried out for locations in Missouri, Nevada, and California, showing a significant cost of power increase for the MO site. Finally, it is concluded that maximum energy storage is not economical, while extra winter collectors are. M.S.K.

A82-24626 // Performance evaluation for a jet pump solar cooling system. F. Zeren and R. E. Holmes (Texas A & M University, College Station, TX). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-30.* 8 p. 20 refs. Members, $2.00; nonmembers, $4.00. Research supported by the Texas Energy and Natural Resources Advisory Council.

Features and performance of a solar flat-plate powered jet pump building cooling system are presented, along with a computer model of the system. Freon-12 is both primary and secondary fluid, and is mixed in the jet pump for routing through a condenser, after which separation occurs and fluid is routed back through the collectors and back to the room cooling loop. Thermodynamic properties of the Freon-12 coolant are incorporated into the computer model, along with weather data for the test program in College Station, TX. The

condenser, collector, and evaporator temperatures were found to be most important in the functioning of a jet pump cooling system, with a collector temperature range of 170-210 F providing the best performance. Lower condenser temperatures were found to increase the performance efficiency and minimize the required collector area. M.S.K.

A82-24827 # Methodology to determine cost and performance goals for active solar cooling systems. M. L. Warren and M. Wahlig (California, University, Berkeley, CA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-32.* 6 p. 13 refs. Members, $2.00; nonmembers, $4.00. Contract No. W-7405-eng-48.

Systems analysis is used to calculate the 20 yr. present value of energy savings of solar cooling systems located in Texas, Arizona, Florida, and Washington, DC, and methods of solar system development to meet the cost goals of economic operation are outlined. Solar cooling systems are projected to begin commercial entry in 1986 and reach 20% of the total cooling market by the year 2000, producing 0.14 quads of displaced energy. A numerical simulation was carried out for both residential and commercial solar cooling units with consideration for system cost goals, cost goals per unit collector area, and the cost goals per ton of cooling. System size was targeted as a 3 ton residential chiller and a 25 ton commercial absorption cooling unit. The costs for volume production are provided, along with trends for an incrementally decreasing need for tax incentives, ending in about 1994. M.S.K.

A82-24628 * # Experimental simulation of latent heat thermal energy storage and heat pipe thermal transport for dish concentrator solar receiver. R. Narayanan, W. F. Zimmerman (General Electric Co., Advanced Energy Programs Dept., Cincinnati, OH), and P. T. Y. Poon (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/Sol-34.* 6 p. 7 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the U.S. Department of Energy; Contract No. JPL-955388.

Test results on a modular simulation of the thermal transport and heat storage characteristics of a heat pipe solar receiver (HPSR) with thermal energy storage (TES) are presented. The HPSR features a 15-25 kWe Stirling engine power conversion system at the focal point of a parabolic dish concentrator operating at 827 C. The system collects and retrieves solar heat with sodium pipes and stores the heat in NaF-MgF2 latent heat storage material. The trials were run with a single full scale heat pipe, three full scale TES containers, and an air-cooled heat extraction coil to replace the Stirling engine heat exchanger. Charging and discharging, constant temperature operation, mixed mode operation, thermal inertial, etc. were studied. The heat pipe performance was verified, as were the thermal energy storage and discharge rates and isothermal discharges. M.S.K.

A82-24867 † 200-W solar photoelectric system based on AlGaAs heterostructure solar cells and mirror concentrators (Solnechnaia fotoelektricheskaia ustanovka moshchnost'iu 200Vt na osnove AlGaAs-geterofotoelementov i zerkal'nykh kohtsentratorov). Zh. I. Alferov, V. M. Andreev, Kh. K. Aripov, V. R. Larionov, and V. D. Rumiantsev (Akademiia Nauk SSSR, Fiziko-Tekhnicheskii Institut, Leningrad, USSR). *Geliotekhnika*, no. 6, 1981, p. 3-6. In Russian.

A 200-W solar system is described which uses nGaAs-pGaAs-pAl(x)Ga(1-x)As heterostructure cells, with an AlGaAs layer thickness of 25-30 microns. The concentrators used in the system are parabolic mirrors with a 50-cm focus. Results on the load volt-ampere characteristics for an individual module and for the system as a whole are presented. It is concluded that it should be possible to significantly increase the output power of such systems. B.J.

A82-24868 † New possibilities for the development and optimization of cascade-type solar cells (O novykh vozmozhnostiakh postroeniia i optimizatsii kaskadnykh solnechnykh elementov). M. B. Kagan and T. L. Liubashevskaia (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). *Geliotekhnika*, no. 6, 1981, p. 7-15. 16 refs. In Russian.

Various aspects of the development of cascade-type solar cells are discussed, including the optimal combination of semiconductor materials and limits on the efficiency of cascade systems; and the development of cascade cells on the basis of optimized heterostructures. Particular attention is given to two cascade-type systems: the GaAs-Ge (pGa/1-x/Al/x/As-pGaAs-nGaAs-nGe-pGe) system, and the three-cascade Ga(1-x)Al(x)-GaAs-Ge system. B.J.

A82-24869 † Choice of design parameters for prism-type solar concentrators (Vybor konstruktivnykh parametrov prizmennykh kontsentratorov solnechnoi energii). E. V. Tver'ianovich (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). *Geliotekhnika*, no. 6, 1981, p. 16-19. In Russian.

After a brief discussion of the operation of prism-type concentrators, the paper examines the choice of design parameters for them. Attention is given to such design parameters as the type of prism concentrator, the concentrator factor, the material, and the prism dimensions. B.J.

A82-24870 † Investigation of the thermal-engineering characteristics of a solar collector with a selective coating and vacuum heat-insulation (Issledovanie teplotekhnicheskikh kharakteristik solnechnogo kollektora s selektivnym pokrytiem i vakuumnoi teploizoliatsiei). T. Baimatov, N. Ch. Dursunov, G. Ia. Umarov, and U. Kh. Gaziev (Akademiia Nauk Uzbekskoi SSR, Fiziko-Tekhnicheskii Institut, Tashkent, Uzbek SSR). *Geliotekhnika*, no. 6, 1981, p. 25-27. 7 refs. In Russian.

Experimental results are presented on the characteristics of a solar collector with a selective coating and vacuum heat-insulation. The maximum temperature of the heat-transfer agent at the collector output was 131 C; the output power density was 320 W/sq m for an emissivity of the transparent screen of 0.9; the emissivity of the receiver with the selective coating was 0.1; the absorption coefficient of the receiver was 0.9; the maximum temperature drop at the ends of the heat exchangers was 10 C. The use of an aluminum foil placed below the receiver increased the temperature of the heat-transfer agent at the collector output by 10-13 C. B.J.

A82-24871 † Investigation of the natural-climatic aging of the reflective films of mirrors by an electrical method (Issledovanie estestvenno-klimaticheskogo stareniia otrazhaiushchikh plenok zerkal elektricheskim metodom). A. Ismanzhanov, L. A. Dubrovskii, and R. A. Zakhidov (Akademiia Nauk Uzbekskoi SSR, Tsentral'noe Proektno-Konstruktorskoe i Tekhnologicheskoe Biuro Nauchnogo Priborostroeniia, Uzbek SSR). *Geliotekhnika*, no. 6, 1981, p. 37-40. 6 refs. In Russian.

Tests were performed to evaluate the natural-climatic aging of reflective aluminum films for solar mirrors. Electrical-resistance measurements were made on unprotected aluminum films and films protected by SiO(x), SiO2, Al2O3, and lacquer coatings. This made it possible to determine the amount of age-related damage experienced by the reflective films, and, in particular, to examine the transition of the film from a matrix type system (where the undamaged part of the film serves as the matrix) to a statistical type system. B.J.

A82-24940 A new look at the discrete ordinate method for radiative transfer calculations in anisotropically scattering atmospheres. II - Intensity computations. K. Stamnes and H. Dale (Alaska, University, Fairbanks, AK). *Journal of the Atmospheric Sciences*, vol. 38, Dec. 1981, p. 2696-2706. 9 refs. NSF Grants No. ATM-79-23266; No. ATM-79-26406.

The recently developed matrix method to solve the discrete ordinate approximation to the radiative transfer equation in plane parallel geometry is extended to compute the full azimuthal dependence of the intensity. Comparing computed intensities with those obtained by other established methods, it is found that for phase functions typical of atmospheric haze 32 streams are sufficient for better than 1% agreement, while 16 streams yield an accuracy of about 1-5% except for angles close to the forward and backward directions for which the error is about 10-15%. The results of the intensity computations are summarized by presenting three-dimensional stack plots of the intensity as a function of polar and azimuthal angles. (Author)

A82-25110 **Asymmetric second-stage concentrators.** E. M. Kritchman (Chicago, University, Chicago, IL). *Applied Optics*, vol. 21, Mar. 1, 1982, p. 870-873. 7 refs.

It is demonstrated that asymmetric ideal second-stage concentrators may be designed for any given concentrator and absorber (within certain limits) and hence may be used in the field of solar energy to eliminate the shading of the primary by the secondary stage. An application involving an off-acceptance angle concentrator in which the primary is not shaded by the secondary from the illuminating source is examined. V.L.

A82-25223 **Solar cells: Operating principles, technology, and system applications.** M. A. Green (New South Wales, University, Kensington, Australia). Englewood Cliffs, NJ, Prentice-Hall, Inc., 1982. 288 p. 153 refs. $28.

Solar cell theory, materials, fabrication, design, modules, and systems are discussed. The solar source of light energy is described and quantified, along with a review of semiconductor properties and the generation, recombination, and the basic equations of photovoltaic device physics. Particular attention is given to p-n junction diodes, including efficiency limits, losses, and measurements. Si solar cell technology is described for the production of solar-quality crystals and wafers, and design, improvements, and device structures are examined. Consideration is given to alternate semiconductor materials and applications in concentrating systems, storage, and the design and construction of stand-alone systems and systems for residential and centralized power generation. M.S.K.

A82-25237 **Selective optical surfaces for solar energy converters.** M. M. Koltun (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Istochnikov Toka, Moscow, USSR). New York, Allerton Press, Inc., 1981. 244 p. 213 refs. Translation. $42.50.

Optical surfaces and coatings with selective spectral characteristics are studied with reference to solar cells and arrays for power generation in space and on the ground. Detailed optical, electrical, and thermal properties are given for solar energy concentrators, radiators, transparent thermoreflective windows, and thermal collectors. It is shown that selective surfaces make it possible to collect up to 90% of the energy contained in the incident solar radiation and to increase the efficiency of photovoltaic generators by 50%. The service life of solar arrays can be increased through the use of selective coatings by a factor of up to several hundreds. V.L.

A82-25501 **Optimization of the functional domain of flat plate collectors (Recherche du meilleur domaine d'utilisation des capteurs solaires plans usuels).** G. Ritoux and J.-L. Irigaray (Clermont-Ferrand II, Université, Aubière, Puy-de-Dôme, France). *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, 2nd Semester, 1981, p. 8-11. In French.

The variations of the extracted heat flux as function of the temperature of the heat transfer fluid in black and selective surface solar collectors are examined. The heat flux is calculated based on the difference of the initial to the stage of thermal equilibrium of the fluid. A nonlinear system of equations is developed and solved by a fast, iterative method to obtain the equilibrium temperatures. It is found that more flux can be extracted from the solar heat by a collector with only one glass cover than with more than one cover. The captured flux is proportional to the coefficient of transmission of the glass coverings, to the coefficient of absorption of the collector, and to the incident flux. Black painted surfaces were more absorbent than selective surfaces, and highest collection efficiencies were displayed by low temperature collectors. Charts of effective uses of the respective types of collectors for heating swimming pools, hot water, home heat, and for refrigeration and air-conditioning are provided. M.S.K.

A82-25503 **Use of a photodiode array for the analysis of the solar profile intensity in concentrating collectors.** C. Bellecci, G. Garofalo, C. Pontiggia (Calabria, Università, Cosenza, Italy), G. A. Rottigni, and R. Visentin (Genova, Università, Genoa, Italy). *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, 2nd Semester, 1981, p. 29-32.

A photodiode array for measuring the light distribution in a cross section of the focal zone of solar concentrator assembly is presented. The photosensors are coupled to electronic circuits for conversion into a display on a CRT screen. The array consists of 24 photodiodes mounted linearly on a 10 cm strip, with each photodiode having an effective area of 9 sq mm. Light attenuators ranging up to 10,000 have been mounted on the photodiodes by vacuum deposition to avoid excess currents in the array, and circuitry switching allows photon counting for formation of histograms representing all 24 photodiodes. Examples are provided for applications with a biaxis parabolic mirror featuring aspirated reflecting lamina and a parabolic trough concentrator with a 2.5 m aperture. M.S.K.

A82-25504 **REA, a solar breeder reactor with high energetic enhancement factor - Technoeconomic analysis.** R. Visentin (Calabria, Università, Cosenza, Italy). *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, 2nd Semester, 1981, p. 33-36.

Noting that the main character of a renewable energy system is a higher energy yield than the energy necessary to produce the system, a solar breeder installation, REA, is described. A numerical analysis is presented which determines the thermodynamic and climatological constraints which bound a satisfactory energy payback for a solar system. REA is composed of 20 linear parabolic concentrator collectors, each 52 m long, with 125 sq m collecting area. The system produces both electricity and thermal power, and the energy costs of the materials and processes needed to fabricate the system are compared to the energy payback of the system over its lifetime and the possibility of utilizing the materials at the end of the plant life. The comparison is made on the basis of 0.85 kW/sq m for at least one hr/day, showing a satisfactory energy payback with less than a total of 1000 hr insolation/yr. M.S.K.

A82-25505 **Solar multiple purpose power plant in modular superlight weight construction.** J. Kleinwachter. *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique*, 2nd Semester, 1981, p. 37-41. 9 refs.

The use of aluminized membranes to form low-cost low-weight solar parabolic concentrators for thermal power production is described, including the practice of covering the concentrators with a transparent enclosure for protection from the weather. Stretching the plane mirror foils over a hollow, drum-shaped body permits production of a slight under- or overpressure inside the drum to deform the foil into a suitable approximation of a parabolic dish. Electric fields and magnetic field have yielded results equivalent to the pneumatic method, and fluorine-based synthetics for the foil are showing the best durability and forming characteristics. Applications involving 3 m and 10 m dishes and a Sterling engine have produced 3.7 and 40.7 kWt at the hot spot, respectively. The optical performance is summarized as an 800 W/sq m flux reduced to 720 W/sq m after traversing the enclosure, and 518 W/sq m reflected from the paraboloid. M.S.K.

A82-25548 **Solar cell performance with an inhomogeneous areal distribution but constant number of recombination centers.** R. O. Bell (Mobil Tyco Solar Energy Corp., Waltham, MA). *Solid-State Electronics*, vol. 25, Feb. 1982, p. 175, 176.

The performance of a solar cell is dependent not only on the number of recombination sites but also on their areal distribution. Calculations show that, with a fixed number of sites, an inhomogeneous distribution can produce a cell with a higher efficiency than one in which the same centers are uniformly distributed. (Author)

A82-25664 * **Solar-pumped electronic-to-vibrational energy transfer lasers.** W. L. Harries (Old Dominion University, Norfolk, VA) and J. W. Wilson (NASA, Langley Research Center, Hampton, VA). *Space Solar Power Review*, vol. 2, no. 4, 1981, p. 367-381. 12 refs. Grant No. NsG-1568.

The possibility of using solar-pumped lasers as solar energy converters is examined. The absorbing media considered are halogens or halogen compounds, which are dissociated to yield excited atoms, which then hand over energy to a molecular lasing medium. Estimates of the temperature effects for a Br2-CO2-He system with He as the cooling gas are given. High temperatures can cause the lower energy levels of the CO2 laser transition to be filled. The inverted populations are calculated and lasing should be possible. However, the efficiency is less than 0.001. Examination of other halogen-molecular lasant combinations (where the rate coefficients

are known) indicate efficiencies in all cases of less than 0.005.

A82-25738 Photoelectrochemical performance of ZnSe/CdSe thin film electrodes in aqueous polysulfide electrolyte. M. A. Russak and J. Reichman (Grumman Aerospace Corp., Research Dept., Bethpage, NY). *Electrochemical Society, Journal*, vol. 129, Mar. 1982, p. 542-545. 19 refs. Contract No. XP9-8002-8.

ZnSe/CdSe heterostructure thin film electrodes were produced by ternary elemental vacuum evaporation. These electrodes behaved similarly to MIS type devices when tested photoelectrochemically. Auger depth profiling indicated the formation of an electrochemically generated ZnS interface layer that provided an enhanced open-circuit voltage compared to CdSe alone. Efficiencies as high as 5.4% under simulated AM2 conditions were recorded for these electrodes.

A82-25739 Study of stabilization and surface recombination on n-GaP photoelectrodes - Mechanisms and interrelation. D. Vanmaekelbergh, W. P. Gomes, and F. Cardon (Gent, Rijksuniversiteit, Ghent, Belgium). *Electrochemical Society, Journal*, vol. 129, Mar. 1982, p. 546-550. 10 refs.

The competition has been studied between three processes occurring with photogenerated holes at the n-GaP/aqueous electrolyte interface, i.e., reaction with Fe(2+) ions, reaction with GaP itself, and surface recombination. The experimental method used was the rotating ring-disk technique. The influence of the reducing agent concentration, of the light intensity, and of the electrode potential was investigated. The results can be interpreted on the basis of models, in which the stabilization process, and under certain circumstances also the recombination process, takes place through surface intermediates of the photoanodic decomposition reaction.

A82-25973 † Automatic control of solar power plants (Avtomaticheskoe upravlenie solnechnymi elektrostantsiiami). V. S. Ermakov and V. M. Dubilovich. *Inzhenerno-Fizicheskii Zhurnal*, vol. 42, Feb. 1982, p. 320-327. In Russian.

The automatic control of the heliostat field of a 200-MW solar power plant is discussed. The advantages of the decentralized control principle with the solution of a number of individual problems in a single control center are emphasized. The basic requirements on heliostat construction are examined, and possible functional schemes for the automatic control of a heliostat field are described. It is proposed that groups of heliostats can be controlled from a single center and on the basis of a single algorithm.

A82-26022 Optimal geometries of plane mirror solar collectors. H. P. Garg, J. K. Sharma, and A. Dang (Indian Institute of Technology, New Delhi, India). *International Journal of Energy Research*, vol. 6, Jan.-Mar. 1982, p. 11-20. 5 refs.

This paper presents an analytical study of a stationary plane mirror solar concentrator. It is composed of an array of east-west oriented trapezoidal channels with two sided reflecting walls and a tubular absorber as a receiver at the base. The most practical design parameters for a trough like concentrator have been analyzed and identified. The one- and two-faceted plane side wall configurations with tubular receiver at the base of the trough have been studied in detail. It has been concluded that large savings in reflecting surfaces are possible while sacrificing some reduction in concentration. A theoretical prediction for the dependence of absorber efficiency on temperature has been obtained.

A82-26024 Thermodynamic analysis of solar thermochemical energy absorption. O. M. Williams (Australian National University, Canberra, Australia). *International Journal of Energy Research*, vol. 6, Jan.-Mar. 1982, p. 61-71. 12 refs.

Thermochemical energy conversion is analyzed on a thermodynamic basis, with special attention given to obtaining guidance on solar thermochemical absorber design at an early stage of development (when technical and cost information is often unreliable). A previously used thermodynamic equivalence technique that is equally applicable to both endothermic and exothermic reactions has been developed to the point where it gives a clear insight into all sources of heat and work. The method is applied to separating those endothermic reactions of which ammonia dissociation is a prime example. A reversibility ratio is defined as the ratio of irreversible work to reversible work. It is shown that in a practical solar thermochemical absorber design, the reversibility ratio should be minimized, corresponding to reaction temperature minimization and thus to lower energy losses and to potential for use of lower cost reactor materials and more active catalysts.

A82-26330 A new look at long term collector performance and utilizability. D. L. Evans, T. T. Rule, and B. D. Wood (Arizona State University, Tempe, AZ). *Solar Energy*, vol. 28, no. 1, 1982, p. 13-23. 27 refs. Contract No. DE-AC03-79CS-30203.

A simple technique has been developed to calculate monthly collection efficiency or monthly utilizability for solar thermal flat-plate collectors. It is applicable to south facing tilted collectors operating with a fixed fluid inlet temperature although extensions to other more generalized uses of utilizability are discussed. The heart of the technique is an empirically determined performance map that makes possible quick evaluations of changes in collector design, geographic location and collector inlet temperature. The collector input variables are those that are commonly measured in most thermal test procedures; geographic input variables are the mean monthly temperature and the Liu and Jordan clearness factor. The procedure was developed for monthly optimum fixed tilts but a simple correction can be made to incorporate arbitrary monthly fixed tilts. The method gives good results compared to long term hourly simulation and makes it possible to determine the operating conditions under which collector performance begins to depend on site-to-site solar radiation/weather variability and the uncertainties that can be expected from its use.

A82-26332 Convective heat transfer in vee-trough linear concentrators. B. A. Meyer, J. W. Mitchell, and M. M. El-Wakil (Wisconsin, University, Madison, WI). *Solar Energy*, vol. 28, no. 1, 1982, p. 33-40. 9 refs. Research supported by the U.S. Department of Energy and University of Wisconsin.

Natural convection heat-transfer coefficients have been experimentally determined for trough-type collectors. The effects of Rayleigh number, tilt angle, and ideal concentration ratio on the Nusselt number have been experimentally determined over ranges representative of collector operation. The Rayleigh number range tested was up to 10,000,000, the tilt angle was varied from 30-90 deg and ideal concentration ratios of 2, 3, 4 and 5 were tested. The experimental results are supported by finite element solutions to the governing equations. A method of extending the results to truncated

trough collectors and CPC collectors is suggested. The convective losses are compared to those for conventional flat plate collectors. The critical Rayleigh number increases with concentration ratio. Nusselt number increases more rapidly at high concentration ratio than at low values. Correlation equations are developed over the range of parameters tested. These results are useful to designers of collectors of this type, and allow estimation of the thermal losses during operation. (Author)

A82-26335 An evaluation of a transverse slatted flat plate collector. K. I. Guthrie and W. W. S. Charters (Melbourne, University, Parkville, Victoria, Australia). *Solar Energy*, vol. 28, no. 2, 1982, p. 89-97. 18 refs.

The design, fabrication, and experimental tests with parallel slat convection suppression devices for eliminating convective heat losses in solar flat plate collectors are detailed. Consideration is given to numerical modelling the natural convection in an inclined cell, and laboratory tests were made to compare collectors with and without a glass slat honeycomb. Further outdoor tests were made on the same plates at angles of 33, 40, and 60 deg in Melbourne, Australia. Significant improvements in the collector performance were found with the use of the slat honeycomb, with values of up to 40% with collectors without selective absorbing surfaces. The slatted collector required reorientation every two months to compensate for the interception of the oncoming radiation by the absorber slats. Further tests of materials suitable for the slats are recommended. M.S.K.

A82-26468 Duplication of radome aerodynamic heating using the Central Receiver Test Facility solar furnace. R. K. Frazer (Johns Hopkins University, Laurel, MD). In: Symposium on Electromagnetic Windows, 15th, Atlanta, GA, June 18-20, 1980, Proceedings. Atlanta, GA, Georgia Institute of Technology, 1980, p. 112-116. 5 refs.

An experiment has been conducted that used the solar furnace at the Central Receiver Test Facility (CRTF) in Albuquerque, NM, to create flight-like temperatures in three supersonic missile radomes. The radomes tested have a von Karman profile, are made of Pyroceram 9606 about 0.25 in. thick, and have a fineness ratio of 2.1 with a base diameter of 13.5 in. The purpose of this effort was to measure the changes in radome boresight error (BSE) caused by aerodynamic heating. This paper describes the thermal aspects of the experiment, including the facility selection, heat flux survey measurements, temperature measurements made on a calibration radome, and calibration of optical pyrometers. A82-26807 Amorphous silicon p-i-n solar cells fabricated by reactive sputtering. T. D. Moustakas and R. Friedman (Exxon Corporate Research Laboratory, Linden, NJ). *Applied Physics Letters*, vol. 40, Mar. 15, 1982, p. 515-517. 10 refs. Contract No. XZ-9-9219.

The fabrication of indium-tin-oxide p-i-n amorphous silicon solar cells by the reactive sputtering method is reported. The solar cells exhibit a power conversion efficiency of 4.0% under AM1 illumination, and evidence is presented that the efficiency of the devices can be further improved to values comparable to those of glow discharge amorphous silicon. The diode properties of the devices are investigated by studying the dark I-V or photocurrent-photovoltage characteristics, and the junction characteristics are discussed. D.L.G.

A82-26950 Thermal energy storage for solar power generation - State of the art. K. N. Shukla (Indian Space Research Organization, Vikram Sarabhai Space Centre, Trivandrum, India). *Heat Transfer Engineering*, vol. 3, Oct.-Dec. 1981, p. 62-72. 46 refs.

High temperature storage for applications in solar-thermal electric systems is considered. Noting that thermal storage is in either the form of latent, sensible or chemically stored heat, sensible heat storage is stressed as the most developed of the thermal storage technologies, spanning direct heating of a storage medium from 120-1250 C. Current methods involve solids, packed beds, fluidized beds, liquids, hot water, organic liquids, and inorganic liquids and molten salts. Latent heat storage comprises phase-change materials that move from solid to liquid with addition of heat and liquid to solid with the removal of heat. Metals or inorganic salts are candidates, and the energy balances are outlined. Finally, chemical heat storage is examined, showing possible high energy densities through catalytic, thermal dissociation reactions. M.S.K.

A82-27010 Effect of phosphorous and boron impurities on amorphous silicon solar cells. T. D. Moustakas, R. Friedman, and B. R. Weinberger (Exxon Corporate Research Laboratory, Linden, NJ). *Applied Physics Letters*, vol. 40, Apr. 1, 1982, p. 587, 588. 6 refs. Contract No. XZ-9-9219.

The effect of dopant impurities (P,B) on the performance of sputtered alpha-SiH(x) solar cells has been investigated. It is found for example, that during the deposition of the N(+) layer of N(+)-I-Pt Schottky barrier structures, the chamber is contaminated with phosphorous which subsequently degrades the intrinsic film. This effect may be eliminated by prolonged pumping of the chamber between N(+) and I layer depositions or by 'compensating' the effects of phosphorus in the I layer through the intentional addition of low levels of boron. (Author)

A82-27012 Band tail recombination limit to the output voltage of amorphous silicon solar cells. T. Tiedje (Exxon Corporate Research Laboratory, Linden, NJ). *Applied Physics Letters*, vol. 40, Apr. 1, 1982, p. 627-629. 14 refs.

Recombination mediated by band tail states is shown to substantially reduce the maximum achievable output voltage in amorphous silicon hydride solar cells. The maximum open circuit voltage calculated from measured density of states parameters and reasonable estimates for the localized state capture rates is 1.0 + or - 0.1 V. (Author)

A82-28170 Concentration of solar radiation by white painted transparent plates. G. Smestad and P. Hamill (Santa Clara, University, Santa Clara, CA). *Applied Optics*, vol. 21, Apr. 1, 1982, p. 1298-1306. 10 refs.

A flat-plate solar concentrator device is described which consists of a white-painted transparent plate, with a photovoltaic cell fixed to an unpainted area on the bottom of the plate so that light scattering off the white material is either lost or directed to the solar cell. Concentration factors of up to 1.9 times the incident solar flux have been achieved using white clays. Such factors approximate those predicted by theory for the parameters investigated. A theory of the operation of the device is developed, by means of which suggestions for system optimization are made. The concentrator's performance is independent of incidence angle, so that it requires no tracking system; it will concentrate on a cloudy day, and is easy to produce. O.C.

A82-28171 Ideal second stages in tandem with parabolic concentrators. E. M. Kritchman (Chicago, University, Chicago, IL).

Applied Optics, vol. 21, Apr. 1, 1982, p. 1307-1309. 15 refs.

It is shown through the derivation of expressions for the concentration capability of both point and linear focus parabolic reflectors, and their extension to include ideal, second-stage concentration, that the ultimate concentration of a primary reflector alone achieves only 1/2 of the ideal limit in two-dimensional, line focus geometry and 1/4 in three-dimensional, point focus geometry. By contrast, the two-stage configurations suggested for both parabolic concentrator geometries are shown to approach the ideal limit at large f/Nos. O.C.

A82-28385 Fundamentals and applications of solar energy. Part 2. Edited by I. H. Faraq (New Hampshire, University, Durham, NH) and S. S. Mehlheimer (Clemson University, Clemson, SC). *AIChE Symposium Series*, vol. 77, no. 210, 1981. 103 p.

Applications of techniques of chemical engineering to the development of materials, production methods, and performance optimization and evaluation of solar energy systems are discussed. Solar thermal storage systems using phase change materials, liquid phase Diels-Alder reactions, aquifers, and hydrocarbon oil were examined. Solar electric systems were explored in terms of a chlorophyll solar cell, the nonequilibrium electric field effects developed at photoelectrode/electrolyte interfaces, and designs for commercial scale processing of solar cells using continuous thin-film coating production methods. Solar coal gasification processes were considered, along with multilayer absorber coatings for solar concentrator receivers, solar thermal industrial applications, the kinetics of anaerobic digestion of crop residues to produce methane, and a procedure for developing a computer simulation of a solar cooling system. M.S.K.

A82-28386 A novel chlorophyll solar cell. J. C. Ludlow (West Virginia University, Morgantown, WV). *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 22-26. 9 refs.

The photosynthetic process is reviewed in order to produce a design for a chlorophyll solar cell. In a leaf, antenna chlorophyll absorbs light energy and conducts it to an energy trap composed of a protein and two chlorophyll molecules, which perform the oxidation-reduction chemistry. The redox potential of the trap changes from 0.4 to -0.6 V, which is sufficient to reduce nearby molecules with redox potentials in that range. The reduction occurs by transfer of an electron, and a chlorophyll solar cell would direct the transferred electron to a current carrier. Chlorophyll antenna and traps are placed on a metallic support immersed in an electron acceptor solution, and resulting electrons from exposure to light are gathered by a metallic current collector. Spinach chlorophyll extracted, purified, and applied in a cell featuring a Pt collector and an octane water emulsion resulted in intensity independent voltages. M.S.K.

A82-28387 Theoretical study of absorbed solar energy in multi-layer absorber coatings for receivers of solar concentrators. I - Radiation transfer analysis. I. S. Taha, M. A. Darwish, and M. M. Elsayed (King Abdulaziz University, Jeddah, Saudi Arabia). *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 27-34.

An analysis of a model of short wave radiation interaction with a coating composed of a microlayer of low emittance substrate covered by a semiconductor layer and two absorbing microlayers is presented. The work is intended to maximize short wave radiation absorption in concentrating solar collector applications. Using multiple layers is noted to permit options of absorptance and material thickness. A numerical model is developed for a multilayer coating with two nonreflecting outermost coatings. Governing equations and boundary conditions are defined for behavior under a monochromatic flux. A solution is formulated for predicting the total amount and distribution of the energy absorbed in the outer layers, integrated over the spectrum of the incident flux. Further consideration is given to compromises in energy gains by absorption and long wave radiation losses from the coatings, in addition to the necessity of expanded studies of the different optical properties of selective surface coatings. M.S.K.

A82-28388 Solar coal gasification - Plant design and economics. W. R. Aiman, C. B. Thorsness, and D. W. Gregg (California, University, Livermore, CA). *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 36-46. 12 refs. Contract No. W-7405-eng-48.

A plant design and economic analysis is presented for solar coal gasification (SCG). Coal pyrolysis and char gasification to form the gasified product are reviewed, noting that the endothermic gasification reactions occur only at temperatures exceeding 1000 K, an energy input of 101-136 kJ/mol of char reformed. Use of solar heat offers the possibility of replacing fuels needed to perform the gasification and the oxygen necessary in order to produce a nitrogen-free product. Reactions, energetics, and byproducts from the gasification of subbituminous coal are modeled for a process analysis code used for the SCG plant. Gas generation is designed to occur in a unit exposed to the solar flux focus from a heliostat field. The SCG gas would have an H2 content of 88%, compared to the 55% offered by the Lurgi process. Initial capital costs for the SCG plant are projected to be 4 times those with the Lurgi process, with equality being achieved when coal costs $4/gJ. M.S.K.

A82-28389 A continuous two stage solar coal gasification system. V. K. Mathur, R. W. Breault (New Hampshire, University, Durham, NH), S. Lakshmanan, F. K. Manasse, and V. Venkataramanan. *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 47-54. 12 refs.

The characteristics of a two-stage fluidized-bed hybrid coal gasification system to produce syngas from coal, lignite, and peat are described. Devolatilization heat of 823 K is supplied by recirculating gas heated by a solar receiver/coal heater. A second-stage gasifier maintained at 1227 K serves to crack remaining tar and light oil to yield a product free from tar and other condensables, and sulfur can be removed by hot clean-up processes. CO is minimized because the coal is not burned with oxygen, and the product gas contains 50% H2. Bench scale reactors consist of a stage I unit 0.1 m in diam which is fed coal 200 microns in size. A stage II reactor has an inner diam of 0.36 m and serves to gasify the char from stage I. A solar power source of 10 kWt is required for the bench model, and will be obtained from a central receiver with quartz or heat pipe configurations for heat transfer. M.S.K.

A82-28390 Commercial-scale process design for thin-film solar cells. T. W. F. Russell, B. N. Baron, and R. E. Rocheleau (Delaware, University, Newark, DE). *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 70-77. 14 refs.

Process and manufacturing costs for commercial-scale production of thin-film solar cells are examined from the viewpoint of the chemical process industry, with emphasis on CdS/Cu2S cells. The cells comprise opaque contact, collector/converter, absorber/generator, transparent contact, and encapsulation/antireflective coating layers. Each layer is deposited as a separate unit operation, through either continuous or batch processing methods. The scale-up of laboratory-verified cell manufacturing steps to commercial processing is detailed from the choice of a Zn-plated copper foil substrate to the bonding of a 1/16 in. tempered glass protective layer with polyvinyl butyral. The total product cost is calculated as a sum of raw materials, utilities, labor, and capital investment costs, using a cost/W for a 1 GW plant. Continuous processing results in a $0.50/W cell with raw materials accounting for 38% of the total product cost. M.S.K.

A82-28392 Computer simulation of solar cooling. M. M. Elsayed, I. S. Taha, and M. A. Darwish (King Abdulaziz University, Jeddah, Saudi Arabia). *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 86-96. 9 refs.

A simplified technique for developing a simulation for analysis of a solar-powered H2O/LiBr absorption cooling system is described. The system considered comprises a flat plate collector, a fluid-filled hot storage tank, an absorber which contains cooling water weak solution, and LiBr closed loops, a heat exchanger to transfer heat between the strong and weak solutions, a generator powered by hot water from the storage tank, a condenser, evaporator, a strong mixture and refrigerant expansion valves. Governing equations are defined for the properties of the binary solution, of the refrigerant, the solar flux, and the air temperature. The numerical performance simulation is detailed for sample winter and summer days, including heat and mass balances. M.S.K.

A82-28498 **Efficient GaAs solar cells formed by UV laser chemical doping.** T. F. Deutsch, J. C. C. Fan, D. J. Ehrlich, G. W. Turner, R. L. Chapman, and R. P. Gale (MIT, Lexington, MA). *Applied Physics Letters*, vol. 40, Apr. 15, 1982, p. 722-724. 10 refs. USAF-DARPA-Army-sponsored research.

GaAs p-n junctions have been formed by ArF - J XeF excimer laser radiation, which releases S atoms by the dissociation of H2S gas while simultaneously heating the substrate to allow incorporation of the S dopant. In addition to fabricating solar cells having AM1 efficiencies of 10.6% from these junctions, the process can produce doped GaAs layers with sheet resistances as low as 30 Ohms/square unit. This efficiency compares favorably with the 12% value obtained for ion-implanted, CW Nd:YAG laser-annealed GaAs solar cells of smaller area.

O.C.

A82-29499 **n-CuInSe2/polysulfide photoelectrochemical solar cells.** Y. Mirovsky and D. Cahen (Weizmann Institute of Science, Rehovot, Israel). *Applied Physics Letters*, vol. 40, Apr. 15, 1982, p. 727, 728. 15 refs. Research supported by the United States - Israel Binational Science Foundation.

Quantum efficiencies as high as 0.8-0.9 are exhibited by n-type single crystals of n-CuInSe2 in aqueous polysulfide solution, over the 600-1150 nm wavelength region, when used as photoanodes in photoelectrochemical cells. Photocurrents corresponding to values of 40 mA/sq cm under AM1 conditions of 100 mW/sq cm sunlight have been measured, and the stability testing of n-CuInSe2 photoanodes for the case of a 20,000 C/sq cm photocharge passage at short-circuit densities of 40 mA/sq cm have shown no deterioration of the measured photocurrents.

SOLAR HEATED FLUIDIZED BED GASIFICATION SYSTEM Patent

Shaik A. Qader, inventor (to NASA) (JPL, California Inst. of Technology, Pasadena) Issued 22 Sep. 1981 5 p Filed 15 May 1980 Supersedes N80-24747 (18 - 15, p 2002) Sponsored by NASA

(NASA-Case-NPO-15071-1; US-Patent-4,290,779; US-Patent-Appl-SN-150115; US-Patent-Class-48-89; US-Patent-Class-48-99; US-Patent-Class-126-438; US-Patent-Class-250-527) Avail: US Patent and Trademark Office CSCL 10A

A solar-powered fluidized bed gasification system for gasifying carbonaceous material is presented. The system includes a solar gasifier which is heated by fluidizing gas and steam. Energy to heat the gas and steam is supplied by a high heat capacity refractory honeycomb which surrounds the fluid bed reactor zone. The high heat capacity refractory honeycomb is heated by solar energy focused on the honeycomb by solar concentrator through solar window. The fluid bed reaction zone is also heated directly and uniformly by thermal contact of the high heat capacity ceramic honeycomb with the walls of the fluidized bed reactor. Provisions are also made for recovering and recycling catalysts used in the gasification process. Back-up furnace is provided for start-up procedures and for supplying heat to the fluid bed reaction zone when adequate supplies of solar energy are not available.

DEVELOPMENT AND FABRICATION OF A SOLAR CELL JUNCTION PROCESSING SYSTEM

S. Bunker Oct. 1981 30 p refs Sponsored in part by DOE Prepared for JPL

(Contracts NAS7-100; JPL-955840)

(NASA-CR-163474; DOE/JPL-955840-81/7; JPL-9950-623; QR-10073-07; QR-7) Avail: NTIS HC A03/MF A01 CSCL 10A

A solar cell junction processing system was developed and fabricated. A pulsed electron beam for the four inch wafers is being assembled and tested, wafers were successfully pulsed, and solar cells fabricated. Assembly of the transport locks is completed. The transport was operated successfully but not with sufficient reproducibility. An experiment test facility to examine potential scaleup problems associated with the proposed ion implanter design was constructed and operated. Cells were implanted and found to have efficiency identical to the normal Spire implant process.

A CONCEPTUAL DESIGN STUDY OF POINT FOCUSING THIN-FILM SOLAR CONCENTRATORS Final Report

11 Nov. 1981 128 p refs Prepared for JPL

(Contract JPL-955804)

(NASA-CR-163472; JPL-9950-625) Avail: NTIS HC A07/MF A01 CSCL 10A

Candidates for reflector panel design concepts, including materials and configurations, were identified. The large list of candidates was screened and reduced to the five most promising ones. Cost and technical factors were used in making the final choices for the panel conceptual design, which was a stiffened steel skin substrate with a bonded, acrylic overcoated, aluminized polyester film reflective surface. Computer simulations were run for the concentrator optics using the selected panel design, and experimentally determined specularity and reflectivity values. Intercept factor curves and energy to the aperture curves were produced. These curves indicate that surface errors of 2 mrad (milliradians) or less would be required to capture the desired energy for a Brayton cycle 816 C case. Two test panels were fabricated to demonstrate manufacturability and optically tested for surface error. Surface errors in the range of 1.75 mrad and 2.2 mrad were measured.

POTENTIAL FOR USING PARABOLIC TROUGH COLLECTORS TO SUPPLEMENT POWER CYCLE BOILERS

W. P. Schimmel, Jr. and L. L. Lukens 1981 17 p refs Presented at Winter Ann. Meeting of the ASME Technol. and Soc. Div., Washington, D.C., 15 Nov. 1981

(Contract DE-AC04-76DP-00789)
(SAND-81-0672C; CONF-811101-3) Avail: NTIS HC A02/MF A01

The advantage of such a system is that solar energy is used to heat the water in a steam Rankine cycle device up to the superheat regime, thus displacing the fossil fuel usually required. The temperature associated with this portion of the power cycle is typically on the order of 320 C or less, which makes it compatible with current parabolic trough collector systems. A system model which lends itself to optimization studies was constructed and exercised over a range of the multiparameter space involved. The collector field, storage, supplementary fossil boiler and superheater, and turbine/generator traded off to obtain a series of economically optimal systems for various years and solar fractions. MODELING SOLAR-ENERGY SYSTEMS FOR ECONOMIC OPTIMIZATION
Richard W. Leigh 1981 6 p refs Presented at the 4th World Eng. Congr., Atlanta, 12 Oct. 1981
(Contract DE-AC02-76CH-00016)
(DE81-030030; BNL-29963; CONF-811030-2) Avail: NTIS HC A02/MF A01

A simple analytic model of solar energy systems is presented which can describe how the performance of the system depends on collector area and storage capacity with surprising accuracy. The model can then be used to determine easily the optimal (lower cost) configuration of collector area and storage capacity, and to see how this configuration will change under various possible fuel, collector, or storage costs. DOE

DEVELOPMENT OF A LOW-COST BLACK-LIQUID SOLAR COLLECTOR, PHASE 2 Final Report, Sep. 1979 - Jul. 1981
D. K. Landstrom, S. G. Talbert, and V. D. McGinniss 30 Sep. 1981 225 p refs
(Contract DE-AC04-79CS-30171)
(DE82-000033; DOE/CS-30171/3) Avail: NTIS HC A10/MF A01

Research efforts were directed toward: evaluating the long-term durability of various plastic materials and solar collector designs; obtaining sufficient outdoor performance data to design a full-scale demonstration of a black liquid solar collector for a commercial application; working closely with a company willing to investigate the possible commercialization of a black liquid plastic collector; and incorporating improved black liquides with the identified plastic collector designs. Indoor weathering tests of various plastics have continued and two outdoor automated test facilities were constructed. One unit was installed at Columbus, Ohio, and the other unit was installed in Phoenix, Arizona. In addition, test facilities in Florida were utilized for static outdoor testing of candidate materials. Results indicate that the black liquid collector is a viable concept and the collectors manufactured during the course of this study were able to perform as theoretically predicted. There are some long-term durability problems still associated with the black liquid collector systems. However, current indications are that a suitable system can be built that should have an expected lifetime of up to 15 years with only marginal (less than 10%) performance degradation. DOE

DESIGN, CONSTRUCTION, AND INITIAL OPERATION OF THE ANL RESEARCH
Y. S. Cha, W. T. Sha, and J. R. Hull Aug. 1981 50 p refs
(Contract W-31-109-eng-38)
(DE82-001961; ANL-81-55) Avail: NTIS HC A03/MF A01

The design consideration of a 1/4 acre research salt-gradient solar pond is described. Experience learned during the construction of the solar pond is presented. Initial operation of the pond indicates that the construction of the pond is sound and no leakage has occurred. The pond began to warm up during March of 1981. The maximum pond temperature reached 830 C at the end of July and it is still rising. All signs indicate that the operation of the well instrumented pond will be a success and the performance of the pond will be as expected, if not better. DOE

THE CLASS C PASSIVE PERFORMANCE EVALUATION PROGRAM Final Report
Sep. 1981 24 p
(Contract DE-AC02-79CS-30150)
(DE82-000454; MASEC-R-81-014; P-101-2) Avail: NTIS HC A02/MF A01

The Class-C performance which provides information on qualities of passive solar features which make them attractive to buyers was evaluated. The following topics are discussed: design of an audit form; design of regionally specific audit addenda; determination of site selection criteria; identification of sites; selection, training, and management of auditors; and packaging of materials of subcontractors for evaluation. Results and findings are presented as follows: demographic profile, passive solar home profile, cost, financing, and payback considerations, expectations, realizations, and satisfaction, and decisionmaking. The Passive Solar Products Catalog was compiled through contacts with over 500 manufacturers and distributors across the country. The product listings are from manufacturers who responded to requests for information and the descriptions are based on information contained in the product literature. Only those products which can be marketed at this time are listed in the 1981 catalog. The catalog contains over 300 product listings. The catalog is organized according to product function and application including passive solar components and design resonances and miscellaneous products. Manufacturer and product indexes are included as a cross reference in the back of the catalog. Distributors are not listed since most manufacturers prefer to have product inquiries initially directed to them. DOE

SOLAR ENERGY SYSTEMS SIMULATION AND ANALYSIS Quarterly Progress Report, 1 Nov. - 30 Dec. 1980
Loren L. Vant-Hull 10 Jan. 1981 36 p refs
(Contract DE-AC03-76SF-10763)
(DE81-026975; DOE/SF-10763/T10; QPR-5) Avail: NTIS HC A03/MF A01

A subroutine to provide central receiver performance simulation code STEAEC with the capability of interpolating the UofH NS code performance summary has been written and is documented herein. A call of this subroutine obviates the need to extrapolate day/hour output efficiencies to produce the elevation-azimuth field performance data, which often involves non-physical Sun locations. The changes are completely transparent to the user. The aspect ratio study was delayed while substantive improvements to the handling of heliostate spacing subject to mechanical limits were made. Mechanical limits play a definitive roll as the aspect ratio increases. The improvements are described. Work on insolation modeling is being culminated with the development of a new procedure for accounting for atmospheric transmission losses between heliostat and receiver. A detailed interpolation/extrapolation procedure based on the LOWTRAN 3 analysis was developed. Subroutines to provide all the necessary input data were also generated. Work has begun on a tentative basis which will lead to a user compatible version of the IH code and to an accompanying users guide. DOE

PHOTOVOLTAIC MECHANISMS IN POLYCRYSTALLINE THIN-FILM SILICON SOLAR CELLS Final Report, 31 May 1979 - 30 May 1981
D. Redfield Jun. 1981 79 p refs
(Contract DE-AC01-79ET-23108)
(DE82-000868; DOE/ET-23108/8) Avail: NTIS HC A05/MF A01

The emphasis during this two-year program began with analysis of fundamental limitations to silicon solar-cell efficiency caused by heavy-doping effects. Near the middle, the emphasis shifted to explanation of the varied electronic properties of grain boundaries in Si. In the first area, and it was shown that all previous analyses which had neglected Auger recombination were necessarily invalid. Important consequences were also found for the strong gradients in dopant concentration that always occur in heavily doped diffused p-n junctions. When these new effects are combined, a simple, natural model results to explain limitations in Si solar-cell performance due to either front or base region effects on either J/sub sc/ or V/sub oc/. As part of this work, a new method was developed for accurate evaluation of the overall performance of AR coatings. DOE

DEVELOPMENTS IN SOLAR-POWERED AIR CONDITIONING: STATE-OF-THE-ART AND PROSPECTS FOR SOUTH AFRICA
A. Johannsen 1980 19 p refs Presented at Frigair Symp., Pretoria, 17-18 Jun. 1980, sponsored by the South African Inst. of Refrigeration and Air Conditioning
(PB81-246076; CSIR-ME-436; Paper-10) Avail: NTIS HC A02/MF A01 CSCL 13A

The state of the art of solar powered air conditioning is reviewed and its potential for South African conditions examined. Three basic cycles, namely the absorption cycle, the Rankine cycle, and desiccant cycle are discussed and their advantages and disadvantages compared. The open cycle type desiccant systems which appear to be well suited for South African conditions are discussed in greater detail. Included is a review of the various system configurations with solid and liquid desiccant and a comparison of their performance under different climatic conditions. Author

METEOROLOGICAL ASPECTS OF THE UTILIZATION OF SOLAR RADIATION AS AN ENERGY SOURCE, PART 1
1981 311 p refs 2 Vol.
(WMO-557-Vol-1; WMO-TN-172-Vol-1; ISBN-92-63-10557-X) Avail: NTIS MF A01; print copy available at WMO, Geneva SwFr 50

Meteorological knowledge and activities related to the harnessing of solar energy are treated. The development of the utilization of various forms of energy by human society is reviewed along with WMO activities in support of the rational use of energy, with special regard to solar radiation. Specific actions by which meteorological services can contribute to the utilization of solar energy are pointed out. User requirements for meteorological data are set; how the data is presented and where it can be obtained are shown. Techniques for the measurement of solar radiation, including the calibration of instruments and quality control of data, are discussed while other meteorological parameters required (air temperature, wind speed, humidity, cloud amount, etc.) are also considered. The retrieval of past data, interpolation methods for the estimation of solar radiation, and publishing and archiving data are dealt with. Author (ESA)

METEOROLOGICAL ASPECTS OF THE UTILIZATION OF SOLAR RADIATION AS AN ENERGY SOURCE. PART 2: ANNEX, WORLD MAPS OF RELATIVE GLOBAL RADIATION
1981 33 p refs 2 Vol.
(WMO-557-Vol-2; WMO-TN-172-Vol-2) Avail: NTIS MF A01; print copy available at WMO, Geneva, SwFr 50

World maps are presented from which the monthly and annual global radiation can be derived, and an overall picture of the distribution of solar radiation as an energy source can be evolved. The radiation reaching the surface of the Earth in the absence of clouds and the atmosphere was calculated from pure astronomical relationships. Results are given in MJ/sq m by 5 deg of latitude. The establishment of an empirical relationship between satellite brightness data and the relative global radiation (defined as the percentage ratio of actual surface global radiation to the astronomically possible global radiation), using available surface global radiation data as reference values, is suggested. SOLAR ENERGY CONTROL SYSTEM Patent
James R. Currie, inventor (to NASA) Issued 8 Dec. 1981 9 p Filed 20 Nov. 1979 Supersedes N80-17544 (18 - 08, p 1023)
(NASA-Case-MFS-25287-1; US-Patent-4,304,219; US-Patent-Appl-SN-096570; US-Patent-Class-126-422; US-Patent-Class-126-429; US-Patent-Class-126-430) Avail: US Patent and Trademark Office CSCL 10A

A solar energy control system for a hot air type solar energy heating system wherein thermocouples are arranged to sense the temperature of a solar collector, a space to be heated, and a top and bottom of a heat storage unit is disclosed. Pertinent thermocouples are differentially connected together, and these are employed to effect the operation of dampers, a fan, and an auxiliary heat source. In accomplishing this, the differential outputs from the thermocouples are amplified by a single amplifier by multiplexing techniques. Additionally, the amplifier is corrected as to offset by including as one multiplex channel a common reference signal.

DEVELOPMENT OF THIN WRAPAROUND JUNCTION SILICON SOLAR CELLS Final Report, Sep. 1980 - Nov. 1981
F. Ho and P. A. Iles Nov. 1981 43 p refs
(Contract NAS3-22228)
(NASA-CR-165570) Avail: NTIS HC A03/MF A01 CSCL 10A

The state of the art technologies was applied to fabricate 50 micro thick 2x4 cm, coplanar back contact (CBC) solar cells with AMO efficiency above 12%. A requirement was that the cells have low solar absorptance. A wraparound junction (WAJ) with wraparound metallization was chosen. This WAJ approach avoided the need for very complex fixturing, especially during rotation of the cells for providing adequate contacts over dielectric edge layers. The contact adhesion to silicon was considered better than to an insulator. It is indicated that shunt resistance caused by poor WAJ diode quality, and series resistance from the WAJ contact give good cell performance. The cells developed reached 14 percent AMO efficiency (at 25 C), with solar absorptance values of 0.73. Space/cell environmental tests were performed on these cells and the thin CSC cells performed well. The optimized design configuration and process sequence were used to make 50 deliverable CBC cells. These cells were all above 12 percent efficiency and had an average efficiency of 13 percent. Results of environmental tests (humidity-temperature, thermal shock, and contact adherence) are also given. E.A.K.

N82-18695*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
THERMODYNAMIC LIMITS FOR SOLAR ENERGY CONVERSION BY A QUANTUM-THERMAL HYBRID SYSTEM
C. E. Byvik, A. M. Buoncristiani, and B. T. Smith Nov. 1981 20 p refs Prepared in cooperation with Christopher Newport Coll.
(NASA-TM-83229) Avail: NTIS HC A02/MF A01 CSCL 10A

The limits are presented to air mass 1.5 conditions. A maximum conversion efficiency of 74 percent is thermodynamically achievable for the quantum device operating at 3500 K and the heat engine in contact with a reservoir at 0 K. The efficiency drops to 58 percent for a cold reservoir at approximately room temperature conditions. Hybrid system efficiencies exceed 50 percent over receiver temperatures ranging from 1400 K to 4000 K, suggesting little benefit is gained in operating the system above 1400 K. The results are applied to a system consisting of a photovoltaic solar cell in series with a heat engine. T.M.

THE ULTIMATE EFFICIENCY OF PHOTOSENSITIVE SYSTEMS
A. M. Buoncristiani, C. E. Byvik, and B. T. Smith Dec. 1981 22 p refs Prepared in cooperation with Christopher Newport Coll.
(Grant NsG-1514)
(NASA-TM-83230) Avail: NTIS HC A02/MF A01 CSCL 10A

These systems have in common two important but not independent features: they can produce a storable fuel, and they are sensitive only to radiant energy with a characteristic absorption spectrum. General analyses of the conversion efficiencies were made using the operational characteristics of each particular system. An efficiency analysis of a generalized system consisting of a blackbody source, a radiant energy converter having a threshold energy and operating temperature, and a reservoir is reported. This analysis is based upon the first and second laws of thermodynamics, and leads to a determination of the limiting or ultimate efficiency for an energy conversion system having a characteristic threshold. T.M.

N82-18697*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
THERMODYNAMIC LIMITS TO THE EFFICIENCY OF SOLAR ENERGY CONVERSION BY QUANTUM DEVICES
A. M. Buoncristiani, C. E. Byvik, and B. T. Smith (Christopher Newport College, Va.) Nov. 1981 14 p refs
(NASA-TM-83228) Avail: NTIS HC A02/MF A01 CSCL 10A

The second law of thermodynamics imposes a strict limitation to the energy converted from direct solar radiation to useful work by a quantum device. This limitation requires that the amount of energy converted to useful work (energy in any form other than heat) can be no greater than the change in free energy of the radiation fields. Futhermore, in any real energy conversion device, not all of this available free energy in the radiation field can be converted to work because of basic limitations inherent in the device itself. A thermodynamic analysis of solar energy conversion by a completely general prototypical quantum device is presented. This device is completely described by two parameters, its operating temperature T sub R and the energy threshold of its absorption spectrum. An expression for the maximum thermodynamic efficiency of a quantum solar converter was derived in terms of these two parameters and the incident radiation spectrum. Efficiency curves for assumed solar spectral irradiance corresponding to air mass zero and air mass 1.5 are presented. T.M.

MARKET ASSESSMENT OF PHOTOVOLTAIC POWER

SYSTEMS FOR AGRICULTURAL APPLICATIONS IN NIGERIA Final Report
David Staples, Henry Steingrass, and James Nolfi (ARD, Inc., Burlington, Vt.) Oct. 1981 115 p refs
(Contracts DEN3-180; DE-AI01-79ET-20485)
(NASA-CR-165511; DOE/NASA/0180-4; C4100-50) Avail: NTIS HC A06/MF A01 CSCL 10A

The market potential for stand-alone photovoltaic systems in agriculture was studied. Information is presented on technical and economically feasible applications, and assessments of the business, government and financial climate for photovoltaic sales. It is concluded that the market for stand-alone systems will be large because of the availability of captial and the high premium placed on high reliability, low maintence power systems. Various specific applications are described, mostly related to agriculture. R.J.F.

I-V CHARACTERIZATION OF SOLAR CELLS [CARACTERIZACAO I-V DE CELULAS SOLARES]
Nelson Veissid, R. Ranvaud, and F. J. Fonseca Jun 1981 12 p refs In PORTUGUESE; ENGLISH summary Presented at the 33rd Ann. Meeting of SBPC, Salvador, Brazil, 8-15 Jul. 1981 Submitted for publication
(INPE-2141-RPE/363) Avail: NTIS HC A02/MF A01

Equivalent circuits were analysed and then I-V characteristics obtained from different solar cells were compared with those from the circuits. The measures were obtained under natural conditions and under artificial conditions (solar simulator made of easily obtained light sources and several filters). The identification of components in the equivalent circuit, together with the theory of photovoltaic conversion, is very important in the optimization of the cell design. A numeric method for determination of the series resistance is proposed. T.M.

MONITORING OF THERMAL STRATIFICATION OF THE STORAGE TANK OF THE MABEL LEE HALL SOLAR-HOT-WATER FACILITY Final Technical Report, 15 Oct. 1979 - 30 Nov. 1980
E. E. Anderson May 1981 37 p refs
(Contract DE-AC02-79CS-30247)
(DE82-002110; DOE/CS-30247/1) Avail: NTIS HC A03/MF A01

Measurements of temperatures and heat inputs for a large liquid solar storage unit were obtained with sufficient spatial and temporal resolution to permit verification of numerical models. Fourteen tests were conducted on the Mabel Lee Hall solar facility. During each two-day test, forty temperatures and three heat inputs were measured every 15 minutes. All the data were reported to DOE and are available for confirmation of numerical models of liquid solar storage units. Examination of the results of five of the tests including charging, discharging and simultaneous charge-discharge operational modes indicate that stratification was maintaind in the tank. The data also show that several natural circulation modes develop depending upon the manner in which the system was operated. DOE

A 100 kWe SOLAR THERMAL POWER PLANT IN KUWAIT, PHASE 1 Final Report, Jun. 1980
Guenther Schmidt, Peter Schmid, Dietmar Wolf, and Helmut Zewen Bonn Bundesministerium fuer Forschung und Technology Oct. 1981 47 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technology
(BMFT-FB-T-81-178; ISSN-0340-7608) Avail: NTIS HC A03/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 10.10

The assembly and test program of the main system components of the solar thermal power station are described. The installation is of the solar farm type and uses highly concentrating rotational symmetric paraboloid mirrors to achieve high efficiencies and Rankine cycle operating temperatures as high as 350 C. The working medium is toluene. Performance tests show proper functioning of the tracking system of the collectors, of the coneshaped absorbers and of the energy conversion system, including all control loops. Author (ESA)

CONSTRUCTION AND TESTING OF A TEST STAND FOR SOLAR CELLS AND CONCENTRATING COLLECTORS Final Report, Apr. 1980
Hainz Pfeiffer Bonn Bundesministerium fuer Forschung und Technology Nov. 1981 131 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technology
(BMFT-FB-T-81-179; ISSN-0340-7608) Avail: NTIS HC A07/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 27.70

A hibrid system consisting of photovoltaic cells and parabolic concentrators was built and tested in order to study the possible cost reduction of photovoltaic systems by concentration of sunlight. The test stand comprises four parabolic tracking reflectors, a cooling circuit, electrical and thermodynamical instrumentation and an electrical water pump as a load. The solar cells are mounted in the focal line of the collectors on a cooling channel designed for optimal heat transfer and their uniform illumination is carefully adjusted. The photovoltaic generator delivers electrical energy with 9.3% efficiency at 25 C. In the hybrid regime the thermal efficiency attains 45% at a temperature of 90 C, and the electrical efficiency 6%. A deposition technique comparable to two-stage anodizing and especially suited for solar absorber panels, using roll-bond Al 99.5 and AlMnZr alloys as a substrate, was developed. The coating is of the nickel structure filter type and provides average solar absorptivity values of 94% and thermal emission values of 14%. The setup of a production plant capable of coating surfaces up to 2 sq m is described as well as the development of corrosion resistent hermetically sealed collectors. By means of an appropriate surface treatment the same corrosion resistance was achieved for absorbers mounted in ventilated collectors. Author (ESA)

(BMFT-FB-T-81-184; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 15.20

The gas space between absorber and cover plates is hermetically sealed by means of a permanent elastic seal of the

polysulfide or polyisobutylene type. The absorber-glass bond fits into a special frame to be manufactured and mounted industrially for easy assembly with titanium-zinc roof structures. The latter is made of prefabricated parts that can easily be joined by soldering. Adequate protection against penetration of rain, water, snow, and dust is provided for. The flat roof mounting is so designed that no boring through the cover is needed for fixing. Test results show high efficiency and long service life.

(BMFT-FB-T-81-186; ISSN-0340-7608) Avail: NTIS HC A06/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 22.30

A deposition technique for selective coatings akin to two-stage anodizing and especially suited for aluminum solar absorber panels was developed. The coating consists of tiny, velvet-like arranged nickel whiskers and provides a solar absorptivity as high as 94% and a low thermal emissivity of 12% to 17%. The coating technique, the production setup, and the test program are described. The coating proves to be resistent to humidity cycle testing and may be used in ordinary ventilated collectors. After production in a pilot production plant of about 10,000 roll-band panels with outstanding optical quality, homogeneity and long-term stability, a series production plant with a 7 m bath length was started. Terrestrial photovoltaic generators were developed for integration into a hybrid system designed to demonstrate cost reduction of photovoltaic systems by concentration of sunlight. The photovoltaic cells consist of monocrystalline silicon, n-p type, 5 by 5 sq cm large and 0.35 mm thick. The antireflection layer is made of TiOx and the contact system of passivated Ti(Pd)Ag. Usage of low ohmic materials and decrease of contact resistance by deeper n-diffusion allows for maintaining cell efficiency almost constant for intensities up to 0.2 W per sq cm. The layout of several hybrid systems using parabolic reflectors is given and the mounting of the solar cells is illustrated. Author (ESA)

FEDSOL: PROGRAM USER'S MANUAL AND ECONOMIC OPTIMIZATION GUIDE FOR SOLAR FEDERAL BUILDING PROJECTS Final Report
Jeanne W. Powell and Richard C. Rodgers, Jr. Aug. 1981. 113 p. refs. Prepared in cooperation with Rodgers (Richard C.), Jr., Sponsored in part by DOE
(PB82-107012; NBSIR-81-2342) Avail: NTIS HC A06/MF A01 CSCL 13A

A user's manual for the FEDSOL computer program is provided. The FEDSOL program determines the economically optimal size of a solar energy system for a user-specified building, location, system type, and set of economic conditions; it conducts numerous breakeven and sensitivity analyses; and it calculates measures of economic performance as required under the Federal Rules. The economic model in the program is linked with the SLR (solar load ratio) design method developed to predict the performance of active systems. The economics portion of the program can, however, be used apart from the SLR method, with performance data provided by the user. Author

(NASA-TM-82767; E-1089) Avail: NTIS HC A04/MF A01 CSCL 10B

The first two years of operation of a stand alone photovoltaic (PV) power system for the village of Tangaye, Upper Volta in West Africa are described. The purpose of the experiment was to demonstrate that PV systems could provide reliable electrical power for multiple use applications in remote areas where local technical expertise is limited. The 1.8 kW (peak) power system supplies 120-V (d.c.) electrical power to operate a grain mill, a water pump, and mill building lights for the village. The system was initially sized to pump a part of the village water requirements from an existing improved well, and to meet a portion of the village grain grinding requirements. The data, observations, experiences, and conclusions developed during the first two years of operation are discussed. Reports of tests of the mills used in the project are included. B.W.

A REVIEW OF THE SALT-GRADIENT SOLAR POND TECHNOLOGY
E. I. H. Lin 30 Jan. 1982 60 p refs
(Contracts NAS7-100; DE-AI03-81SF-11552)
(NASA-CR-168635; JPL-Pub-81-116; JPL-5107-3; DOE/SF-11552/1) Avail: NTIS HC A04/MF A01 CSCL 10A

The state of the salt-gradient solar pond technology is reviewed. Highlights of findings and experiences from existing ponds to date are presented, and the behavior, energy yield, operational features, and economics of solar ponds are examined. It is concluded that salt-gradient solar ponds represent a technically feasible, environmentally benign, and economically attractive energy producing alternative. In order to bring this emerging technology to maturity, however, much research and development effort remains to be undertaken. Specific R&D areas requiring the attention and action of technical workers and decision-makers are discussed, both from the perspectives of smaller, thermally-oriented ponds and larger, electricity generating ponds. DESIGN OF MOBILE PHOTOVOLTAIC POWER SYSTEMS: 0.5-3kW Final Report
Roy D. Gibson 1 Oct. 1981 133 p
(Contract DAAK70-80-C-0147)
(AD-A108889) Avail: NTIS HC A07/MF A01 CSCL 10/2

This contract effort can be summarized by four technical tasks: Task 1 - Analysis of Engine-Generator Inventory and Use for a less than 5 kW system; Task 2 Parametric analysis of the Transportability of Photovoltaic System, i.e., the range of size

and weight of transportable trailers and the associated PV generator size; Task 3 - Preliminary Cost Estimates for Photovoltaic Systems; and Task 4 - Preliminary Photovoltaic System Design. This report presents the results of Task 1 for the engine generator set planned inventory and characteristics. Task 1 also contained candidate photovoltaic system configurations which would be compared with the engine-generator characteristics identified in Task 1. A parametric study was made of sizing trade-offs between photovoltaic arrays and battery storage capacities which were capable of at least meeting the identified engine-generator characteristics and on structural designs for the photovoltaic array and storage battery for the two trailer configurations. The preliminary cost estimate support in Task 3 involved life cycle cost analysis for the system sizes studied in Task 1. The Task 4 preliminary system design support consisted of examining the results of Tasks 1, 2 and 3 and determining characteristics of transportable photovoltaic systems. GRA

DEVELOPMENT OF SIMPLE SOLAR COLLECTORS Final Report
Wilmar Fuhse, Karl Jaeger, and Hans-Peter Kleinemeier. Bonn Bundesministerium fuer Forschung und Technologie Nov. 1981 314 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-174; ISSN-0340-7608) Avail: NTIS HC A14/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 47.90

The feasibility of simplifying solar energy systems, and the production techniques of their components, for usage in developing countries was investigated. The emphasis in those countries should not be so much on efficiency. Simplicity of construction and minimal reliance on imported components should be emphasized rather than efficiency because of favorable radiation conditions and high ambient temperatures. Several systems were tested consisting only of collectors, heat storage and a simple flow control. The construction of the collectors was reviewed for materials, heat vector, efficiency, construction and assembly techniques, and the material resources and climate of individual countries. As a result, a prototype collector was built and tested, satisfying the requirements. Author (ESA)

STAGNATION TEMPERATURE TEST METHODS FOR DETERMINING SOLAR COLLECTOR THERMAL PERFORMANCE DEGRADATION Ph.D. Thesis
Aaron Grayson Dawson, III 1981 156 p
Avail: Univ. Microfilms Order No. 8126252

An analytical and experimental investigation was undertaken to evaluate a proposed method for determining the thermal degradation of materials used in flat-plate solar collectors. The proposed method is based on measuring stagnation (no-flow) temperatures of the absorber plate. A comparison of the advantages and limitations of the proposed method is made with the conventionally used existing method which is based on measuring the energy output from the collector. Previous investigations show that the existing test method may not be sufficiently sensitive to detect expected changes in material properties, is influenced by the test environment, and is relatively expensive to perform. The material properties of interest are primarily the cover transmittance, the solar absorptance of the absorber, the infrared emittance of the absorber, and the thermal conductivity of insulation. Dissert. Abstr.

ANALYTICAL AND EXPERIMENTAL ANALYSIS OF PROCEDURES FOR TESTING SOLAR DOMESTIC HOT WATER SYSTEMS Ph.D. Thesis
Arthur Hunter Fanney, II 1981 181 p
Avail: Univ. Microfilms Order No. 8126255

Three experimental techniques which allow the net thermal output of an irradiated solar collector array, without the use of a solar simulator, to be reproduced indoors are investigated. These techniques include use of an electric heat source only, use of a nonirradiated collector array in series with an electric heat source, and the use of electric strip heaters which are attached to the back of nonirradiated absorber plates. Expressions are developed to compute the input power required for each experimental technique. Solar collectors connected in parallel and series combinations are considered. Experiments conducted to determine the effect of storage tank, temperature stratification on system performance for a single tank direct solar hot water system are described. Dissert. Abstr.

BUFFER THERMAL ENERGY STORAGE FOR AN AIR BRAYTON SOLAR ENGINE Final Report
Hal J. Strumpf and Kevin P. Barr 31 Aug. 1981 79 p refs Prepared for JPL
(Contracts NAS7-100; JPL-995136)
(NASA-CR-168657; NAS 1.26:168657; AIRESEARCH-81-18087) Avail: NTIS HC A05/MF A01 CSCL 10C

The application of latent-heat buffer thermal energy storage to a point-focusing solar receiver equipped with an air Brayton engine was studied. To demonstrate the effect of buffer thermal energy storage on engine operation, a computer program was written which models the recuperator, receiver, and thermal storage device as finite-element thermal masses. Actual operating or predicted performance data are used for all components, including the rotating equipment. Based on insolation input and a specified control scheme, the program predicts the Brayton engine operation, including flows, temperatures, and pressures for the various components, along with the engine output power. An economic parametric study indicates that the economic viability of buffer thermal energy storage is largely a function of the achievable engine life. A.R.H.

STEAM RANKINE SOLAR RECEIVER, PHASE 2 Final Technical Report
L. E. DeAnda and M. Faust 23 Nov. 1981 95 p refs Prepared for JPL
(Contracts NAS7-100; JPL-955157)
(NASA-CR-168656; NAS 1.26:168656; AIRESEARCH-80-17527) Avail: NTIS HC A05/MF A01 CSCL 10A

A steam rankine solar receiver (SRSR) based on a tubular concept was designed and developed. The SRSR is an insulated, cylindrical coiled tube boiler which is mounted at the focal plane of a fully tracking parabolic solar reflector. The concentrated solar energy received at the focal plane is then transformed to thermal energy through steam generation. The steam is used in

a small Rankine cycle heat engine to drive a generator for the production of electrical energy. The SRSR was designed to have a dual mode capability, performing as a once through boiler with and without reheat. This was achieved by means of two coils which constitute the boiler. The boiler core size of the SRSR is 17.0 inches in diameter and 21.5 inches long. The tube size is 7/16 inch I.D. by 0.070 inch wall for the primary, and 3/4 inch I.D. by 0.125 inch wall for the reheat section. The materials used were corrosion resistant steel (CRES) type 321 and type 347 stainless steel. The core is insulated with 6 inches of cerablanket insulation wrapped around the outer wall. The aperture end and the reflector back plate at the closed end section are made of silicon carbide. The SRSR accepts 85 kwth and has a design life of 10,000 hrs when producing steam at 1400 F and 2550 psig. S.L.

A MODULE EXPERIMENTAL PROCESS SYSTEM DEVELOPMENT UNIT (MEPSDU) Quarterly Report, 1 Sep. - 30 Nov. 1981
30 Nov. 1981 25 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-955902)
(NASA-CR-168667; DOE/JPL-955902-81/4; NAS 1.26:168667; QR-4) Avail: NTIS HC A02/MF A01 CSCL 10A

The development of a cost effective process sequence that has the potential for the production of flat plate photovoltaic modules which meet the price goal in 1986 of 70 cents or less per Watt peak is described. The major accomplishments include (1) an improved AR coating technique; (2) the use of sand blast back clean-up to reduce clean up costs and to allow much of the Al paste to serve as a back conductor; and (3) the development of wave soldering for use with solar cells. Cells were processed to evaluate different process steps, a cell and minimodule test plan was prepared and data were collected for preliminary Samics cost analysis. A.R.H.

LSA LARGE AREA SILICON SHEET TASK ENHANCED ID SLICING TECHNOLOGY FOR SILICON INGOTS Final Report
George F. Fiegl Dec. 1981 43 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-955282)
(NASA-CR-168668; NAS 1.26:168668; DOE/JPL-955282-81/1) Avail: NTIS HC A03/MF A01 CSCL 10A

A commercially available saw was equipped with a programmable ingot advance/rotation unit and a closed loop cutting edge position control system. Extensive experimentation with ingot rotation revealed that, due to the combination of the anisotropic material character of the monocrystalline silicon and ingot rotation during cutting, severe limitations on productivity were imposed. Cutting edge position control, with low kerf blades reduced the deflection by one order of magnitude thus contributing significantly to the kerf reduction. While prefabricated blade inserts promise great potential for increasing the blade lifetime while decreasing kerf, more fundamental work in the materials area of the bond is required before these blades become an effective production tool. An alternative solution of etched core construction permitted low kerf slicing, but further refinement for greater lifetime is necessary. A.R.H.

DYNAMIC ELECTRICAL RESPONSE OF SOLAR CELLS
Jean-Pierre Catani Jun. 1981 42 p Transl. into ENGLISH from CNES Note Technique no. 85 (France), Oct. 1978 p 1-41, 69-87 Translation was announced as N80-11629 Transl. by SCITRAN, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-76686; NAS 1.15:76686) Avail: NTIS HC A03/MF A01 CSCL 10A

The dynamic response of a solar generator is of primary importance as much for the design and development of electrical power conditioning hardware as for the analysis of electromagnetic compatibility. A mathematical model of photo-batteries was developed on the basis of impedance measurements performed under differing conditions of temperature, light intensity, before and after irradiation. This model was compared with that derived from PN junction theory and to static measurements. These dynamic measurements enabled the refinement of an integration method capable of determining, under normal laboratory conditions, the dynamic response of a generator to operational lighting conditions. LOW COST CZOCHRALSKI CRYSTAL GROWING TECHNOLOGY. NEAR IMPLEMENTATION OF THE FLAT PLATE PHOTOVOLTAIC COST REDUCTION OF THE LOW COST SOLAR ARRAY PROJECT Final Report, 12 Mar. 1979 - 30 Sep. 1980
E. G. Roberts 30 Sep. 1980 190 p refs Sponsored in part by DOE Prepared for JPL
(NASA-CR-168658; NAS 1.26:168658; JPL-9950-632; DOE/JPL-955270-8078) Avail: NTIS HC A09/MF A01 CSCL 10A

Equipment developed for the manufacture of over 100 kg of silicon ingot from one crucible by rechanging from another crucible is described. Attempts were made to eliminate the cost of raising the furnace temperature to 250 C above the melting point of silicon by using an RF coil to melt polycrystalline silicon rod as a means of rechanging the crucible. Microprocessor control of the straight growth process was developed and demonstrated for both 4 inch and 6 inch diameter. Both meltdown and melt stabilization processes were achieved using operator prompting through the microprocessor. The use of the RF work coil in poly rod melting as a heat sink in the accelerated growth process was unsuccessful. The total design concept for fabrication and interfacing of the total cold crucible system was completed. A.R.H.

COMMERCIAL/INDUSTRIAL PHOTOVOLTAIC MODULE AND ARRAY REQUIREMENT STUDY. LOW-COST SOLAR ARRAY PROJECT ENGINEERING AREA Final Report
Dec. 1981 326 p refs Sponsored in part by DOE Prepared for JPL
(Contract JPL-955698)
(NASA-CR-168664; NAS 1.26:168664; DOE/JPL-955698) Avail: NTIS HC A15/MF A01 CSCL 10B

Design requirements for photovoltaic modules and arrays used in commercial and industrial applications were identified. Building codes and referenced standards were reviewed for their applicability to commercial and industrial photovoltaic array installation. Four general installation types were identified - integral (replaces roofing), direct (mounted on top of roofing), stand-off (mounted away from roofing), and rack (for flat or low slope roofs, or ground mounted). Each of the generic mounting types can be used in vertical wall mounting systems. This implies eight mounting types exist in the commercial/industrial sector. Installation costs were developed for these mounting types as a function of panel/module size. Cost drivers were identified. Studies were performed to identify optimum module shapes and sizes and operating voltage cost drivers. The general conclusion is that there are no perceived major obstacles to the use of photovoltaic modules in commercial/industrial arrays. R.J.F.

LARGE AREA SILICON SHEET BY EFG Annual Progress Report, 1 Oct. 1980 - 30 Sep. 1981
30 Sep. 1981 71 p refs Prepared for JPL
(Contract JPL-954355)

(NASA-CR-168680; NAS 1.26:168680; DOE/JPL-954355-81) Avail: NTIS HC A04/MF A01 CSCL 10A

Progress was made in improving ribbon flatness and reducing stress, and in raising cell performance for 10 cm wide ribbon grown in single cartridge EFG furnaces. Optimization of growth conditions resulted in improved ribbon thickness uniformity at a thickness of 200 micron, grown at 4 cm/minute, and growth at this target speed is routinely achieved over periods of the order of one hour or more. With the improved ribbon flatness, fabrication of large area (50 sq cm) cells is now possible, and 10 to 11% efficiencies were demonstrated on ribbon grown at 3.5 to 4 cm/minute. Factors limiting performance of the existing multiple ribbon furnace were identified, and growth system improvements implemented to help raise throughput rates and the time percentage of simultaneous three-ribbon growth. However, it is evident that major redesign of this furnace would be needed to overcome shortfalls in its ability to achieve the Technical Features Demonstration goals of 1980. It was decided to start construction of a new multiple ribbon furnace and to incorporate the desired improvements into its design. The construction of this furnace is completed. J.M.S.

EVALUATION OF THE EFFECTS OF A FREEZE/THAW ENVIRONMENT ON CELLULAR GLASS

P. Frickland, E. Cleland, and T. Hasegawa 15 Aug. 1981 41 p refs

(Contract DE-AT04-81AL-16228)

(NASA-CR-168719; DOE/JPL-1060-44; NAS 1.26:168719; DE81-03093) Avail: NTIS HC A03/MF A01 CSCL 11B

Cellular glass technology with respect to solar energy applications was briefly reviewed and current applications and related studies are discussed. Using the evaluation criteria of water vapor permeability and conformability, a protective butyl rubber/silicone conformal coating system was selected for use on Foamglas substrates in a freeze/thaw environment. The selection of a specific freeze/thaw cycle which closely models field conditions is discussed. A sampling plan is described which allows independent evaluation of the effects of conformal coatings, cycle number and location within the environmental chamber. The results of visual examination, measurement of density, modulus of rupture and Young's modulus are reported. Based upon statistical evaluation of the experimental results, it is concluded that no degradation in mechanical properties of either coated or uncoated Foamglas occurred within the duration of the test (53 freeze/thaw cycles). CARLISLE HOUSE: AN ALL-SOLAR-ELECTRIC RESIDENCE
B. E. Nichols Oct. 1981 25 p refs
(Contract DE-AC02-76ET-20279)
(DE82-004376; DOE/ET-20279/143) Avail: NTIS HC A02/MF A01

The first solar photovoltaic house designed and constructed under the US Department of Energy's Solar Photovoltaic Residential Project was completed. The house, which is powered by a 7-kWp photovoltaic system, will be used to assess the occupants' acceptance of and reactions to residential photovoltaic systems and to familiarize utilities, builders, developers, town building officials and others with issues concerning photovoltaic installations. The house is located on a two-acre lot in Carlisle, Massachusetts, approximately twenty miles northwest of Boston. Built by a local architect/developer team, the house includes energy conservation and passive solar features. It utilizes a roof-mounted, flat-plate PV array which operates in a two-way energy exchage mode with the electric utility. The energy conservation and passive solar features of this house are described and detailed description of the utility-interactive photovoltaic system is presented, along with initial performance data. OPTICAL PROPERTIES OF SOLIDS FOR SOLAR ENERGY CONVERSION Ph.D. Thesis
Bjoem Karlsson 1981 19 p refs Sponsored in part by the Swedish Natural Science Research Council (NFR), the Swedish Council for Building Research (BRF), and the Swedish Board for Technical Development (STU)
(ISSN-0345-0058; ISBN-91-554-1226-2) Avail: NTIS HC A02/MF A01

The optical properties of transition metal carbides and nitrides were studied by reflectance measurements between 0.2 and 15 micrometers at room temperature and up to 500 C. An interpretation of the pronounced difference between the nitrides and carbides is made from a model in the electronic density of states distribution. The model is used to explain shifts in the optical constants when carbon or nitrogen-vacancies are introduced in the nitride. Calculations based on the optical constants suggest the nitrides as a new material for transparent heat-mirrors. The refractive index and band-edge of CuO, Cu sub 2O, Fe sub 2O sub 3, Cr sub 2O sub 3, i-C and a-Si have been measured and discussed within the framework of a new model for evaluating their potential use as the absorbing layer on a tandem-selective surface. A number of oxides on copper and steel were prepared by thermal and chemical methods and investigated for use as selectively absorbing surfaces. Thin films of noble and transition metals have been prepared and optically investigated for use as semi-transparent coatings on domestic windows. Author

A PASSIVE SOLAR RETROFIT STUDY FOR CONCRETE BLOCK BUILDINGS Report, Oct. 1980 - Sep. 1981
William O. Wray, Charles R. Miles (NCEL), and Claudia E. Kosiewicz Jan. 1982 ~~42~~ p refs
(Contract N68305-81-MP-10003)
(AD-A110189; CEL-CR-82.007) Avail: NTIS HC A03/MF A01 CSCL 13/1

A passive solar retrofit study has been conducted for the Navy at the Los Alamos National Laboratory. The purpose of the study was to determine the energy savings obtainable in concrete block buildings from several passive solar heating and conservation strategies. A procedure involving the use of test cell data and computer simulation was employed to assess the merits of six retrofit options. The six strategies selected were chosen on the basis of providing a series of options that will deliver increasing energy savings at the cost of correspondingly increased levels of commitment. SOLAR ENERGY INFORMATION USER STUDY: MILITARY ENGINEERS
T. L. Marle and W. W. Below Sep. 1981 100 p
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(DE82-001606; SERI/TR-761-1047) Avail: NTIS HC A05/MF A01

Data from questionnaires administered to military engineers and architects attending a 2 day solar design workshop are summarized. The workshop was designed to inform engineers when and where solar energy could be used more effectively. The study aimed to identify the solar energy information needs and information habits of the professionals, their familiarity with and appraisal of relevant military publications containing solar energy information currently available, and the overall effectiveness of the workshops (including structure and content). To measure the effectiveness of the workshop itself and provide input on producing an effective and comprehensive information dissemination plan for military engineers nationwide, 2 questionnaires were designed and administered to the participants. A preworkshop questionnaire assessed the participant's knowledge of solar energy prior to attending the workshop. T.M.

ECONOMIC ASSESSMENT OF BATTERY STORAGE IN SOLAR PHOTOVOLTAIC APPLICATIONS First-year Project Summary
R. O. Mueller, W. J. Walsh, B. K. Cha, and R. F. Giese May 1981 56 p refs
(Contract W-31-109-eng-38)
(DE82-004045; ANL/SPG-20) Avail: NTIS HC A04/MF A01

Savings attributable to batteries were evaluated for three representative US utility service areas. The photovoltaic (PV) devices were assumed capable of exporting excess power to the utility grid; and the batteries, sited at the substation, were operated as a form of load-leveling utility storage. A cost-allocation model, SIMSTOR, was employed to determine utility fuel and resulting capital cost savings. The effects of installing PV devices were evaluated. Results indicated that batteries and PV systems do not directly compete when attached to the electricity supply grid. Utility savings were primarily fuel savings; those from the batteries were savings in utility capacity. Batteries with higher discharge rates and larger storage capacities are to be favored. It was determined that lead/acid and zinc/chlorine batteries are the leading contenders in the near term. M.D.K.

CONCEPTUAL DESIGN OF A SOLAR COGENERATION FACILITY INDUSTRIAL PROCESS HEAT, CATEGORY A. EXECUTIVE SUMMARY Final Report, 10 Sep. 1980 - 14 Aug. 1981
P. Joy, Martin Brzeczek, Harold Sellestad, Carl Silverman, and George Yenetchi Jul. 1981 235 p Prepared in cooperation with Badger Energy, Inc., Martin Marietta, Denver and Pacific Gas and Electric, San Ramon, Calif.
(Contract DE-AC03-80SF-11438)
(DE82-001663; DOE/SF-11438/T1-Vol-1) Avail: NTIS HC A11/MF A01

The conceptual design of a central receiver solar cogeneration facility at a California oil field is described. The process of selecting the final cogeneration system configuration is described and the various system level and subsystem level tradeoff studies are presented, including the system configuration study, technology options, and system sizing. The facility is described, and the functional aspects, requirements operational characteristics, and performance are discussed. Capital and operating costs, safety, environmental, regulatory issues and potential limiting considerations for the design are included. Each subsystem is described in detail including a discussion of the functional requirements, design, operating characteristics performance estimates and a top level cost estimate. An economic assessment is performed to determine the near-term economic viability of the project and to examine the impact of variations in major economic parameters such as capital and operating and maintenance costs on economic viability. Two measures of economic viability used are levelized energy cost and net present value.

ROBINS AIR FORCE BASE SOLAR COGENERATION FACILITY, VOLUME 1 Final Report
Aug. 1981 321 p refs 2 Vol.
(Contract DE-AC03-81SF-11494)
(DE82-001922; DOE/SF-11494/T1-Vol-1) Avail: NTIS HC A14/MF A01

A conceptual design and cost estimate for a demonstration solar facility to generate electricity and deliver process steam to the existing base distribution systems is considered. The solar energy system is a central receiver arrangement. The technical approach to the project and the rationale for selecting the site at Robins Air Force Base are discussed. The evaluation of alternative configurations considered to have potential for improving the facility value is summarized. The solar facility is described, including system level functional requirements, design, operation, performance, cost, safety, environmental, institutional, and regulatory considerations. The design, functional requirements and operating characteristics which influence cost or performance for each subsystem are described. The subsystems are the collector, receiver/tower, master control, electric power generation, and facility steam and feedwater subsystems.

Eight appendices are included. The first is a facility specification which defines the characteristics, and design and environmental requirements for the facility. The facility conceptual design, performance, costs and economic data are provided as well as a description of the existing facility. The second appendix contains the drawings generated in support of the conceptual design. The third presents the MIRVAL computer code used to calculate the incident energy on the solar receiver. The fourth provides details on the predicted performance of the predicted performance of the modified steam turbine and the typical commercial turbine. The fifth contains the annual integration performance model of sizing the facility. The sixth contains steam load data projected

to 1985. A computer model developed to integrate the hour-by-hour, steady-state, performance of the final conceptual cogeneration facility is given in the seventh appendix. Finally, descriptions and vendor data for the balance of the plant equipment arower, master control, electric power generation, and facility steam and feedwater subsystems. DOE

CONVINCING THE HOME BUILDER TO BUILD SOLAR HOMES: EVALUATION OF PASSIVE SOLAR WORKSHOP FOR BUILDERS

S. Klein Sep. 1981 97 p refs

(Contract DE-AC02-77CH-00178)

(DE82-001978; SERI/TR-722-892) Avail: NTIS HC A05/MF A01

In 1979-80, a pilot series of workshops for home builders was offered throughout the United States. The primary objectives of the project were to educate the home builder in passive solar design techniques, to promote favorable attitudes toward solar concepts, and to encourage builders to use solar design in residential construction. Builders and designers were targeted because they are the decision makers in the progress of commercializing solar design in new construction. The need is outlined for continued and expanded programs for builders to facilitate usage of solar design in the residential sector, based on information provided in nearly 1100 pre- and post-training forms returned. SOLAR DESIGN AND INSTALLATION EXPERIENCE: AN OVERVIEW OF RESULTS FROM THE NATIONAL SOLAR DATA NETWORK

H. O. Holte and C. J. Kelly, ed. Jun. 1981 78 p refs

(Contract DE-AC01-79CS-30027)

(DE82-001657; SOLAR/0009-81/37) Avail: NTIS HC A05/MF A01

Results, conclusions and insights drawn from analysis of the various types of solar energy systems are presented. Some sites have been monitored for over four years. Performance information, derived from accurately measured field data, are oresented and may be related to design data for the sites. Information is identified for such factors as the ratio of storage volume to collector area, heating and cooling load and the ratio of collector area to building floor area. DOE

ECONOMIC ANALYSIS OF SOLAR INDUSTRIAL PROCESS HEAT SYSTEMS: A METHODOLOGY TO DETERMINE ANNUAL REQUIRED REVENUE AND INTERNAL RATE OF RETURN

W. C. Dickinson and Kenneth C. Brown 11 Aug. 1981 48 p refs

(Contract W-7405-eng-48)

(DE82-001628; UCRL-52814-Rev-1) Avail: NTIS HC A03/MF A01

An economic evaluation of solar industrial process heat systems, is developed to determine the annual required revenue and the internal rate of return. First, a format is provided to estimate the solar system's installed cost, annual operating and maintenance expenses, and net annual solar energy delivered to the industrial process. The annual required revenue and the price of solar is calculated. The economic attractiveness of the potential solar investment can be determined by comparing the price of solar energy with the price of fossilfuel, both expressed in levelized terms. This requires calculation of the internal rate of return on the solar investment or, in certain cases, the growth rate of return. DOE

ACTIVE AND PASSIVE COOLING FOR CONCENTRATING PHOTOVOLTAIC ARRAYS

M. W. Edenburn and Michael W. Edenburn Oct. 1981 23 p refs

(Contract DE-AC04-76DP-00789)

(DE82-003922; SAND-81-0530) Avail: NTIS HC A02/MF A01

Optimization, based on minimum energy cost, of active and passive cooling designs for point-focus Fresnel lens photovoltaic arrays and linas-focus, parabolic-trough photovoltaic arrays is discussed, and the two types of cooling are compared. Passive cooling is more cost-effective for Fresnel lens arrays while the reverse is true for parabolic-trough arrays. DOE

EXPLORATORY DEVELOPMENT OF THIN-FILM POLYCRYSTALLINE PHOTOVOLTAIC DEVICES Semiannual Topical Report, 1 Oct. 1980 - 1 Jun. 1981

Jun. 1981 56 p refs Prepared in cooperation with RCA Labs.

(Contract DE-AC02-77CH-00178)

(DE82-000092; SERI/PR-0-9100-1) Avail: NTIS HC A04/MF A01.

During this period, heavy emphasis was placed on substrate and epitaxial process and reactor development since these are the major components of this approach to low-cost solar-cell modules. The substrate task seeks to apply the HEM ingot technology to commercial metallurgical grade (MG) silicon to form a substrate suitable for epitaxial growth and solar-cell fabrication. A conceptual study of three epitaxial reactor systems was conducted to provide a sound theoretical and practical basis for continued and future development of reactor systems. Initial cost projections which were conducted based on SAMICS/IPEG methodolgies indicate that attainment of the cost-goal of less than 0.50 $/Wp can be achieved. T.M.

PHOTOVOLTAIC AND STRUCTURAL PROPERTIES OF a-Si:H THIN FILMS Quarterly Technical Report, 1 Jun. - 31 Aug. 1981

R. Messier Nov. 1981 21 p refs Prepared for Midwest Reseach Inst., Golden, Colo.

(Contract DE-AC02-77CH-00178)

(DE82-002755; SERI/PR-9227-1-T1, QTR-5) Avail: NTIS HC A02/MF A01

The physical structure of a vapor-deposited thin film is related to adatom mobility, adatom species, and bombardment effects at the growing film surface. Bombardment effects were found to be the dominant factor. For floating film potentials greater than approximately - 20V, Ar(+)-Ion bombardment results in a drastic decrease in observable film microstructure. Adatom significant bombardment. The evolution of film physical structure was studied in detail. Hydrogenated a-Si films prepared by rf-sputtering were investigated as a function of film thickness, substrate type, and roughness. The physical structure was shown to evolve with film thickness as a result of the nucleation, growth, and incomplete coalescence of island-like structures which leads to a supernetwork of larger voids. The structural evolution was essentially unaffected by substrate type for this material in which low adatom mobility is the controlling factor. M.D.K.

PHOTOVOLTAIC AND STRUCTURAL PROPERTIES OF a-Si:H THIN FILMS Quarterly Technical Progress Report, 1 Dec. 1980 - 28 Feb. 1981

R. Messier and I. S. T. Tsong 1981 7 p refs Prepared for Midwest Research Inst., Golden, Colo.

(Contract DE-AC02-77CH-00178)

(DE82-002698; SERI/PR-9227-1-T3, QTPR-3) Avail: NTIS HC A02/MF A01

The substrate floating potential, V/sub s/, was measured

as a function of RF-sputtering conditions using an electrostatic probe. The large negative V/sub s/ induced at low P/sub Ar/ was responsible for energetic ion-bombardment at the growing film/plasma interface. This bombardment, when below a threshold potential -20V, results in local atomic rearrangement and selective resputtering, leading to minimization of microstructure defects. Results on film characteristics vs. V/sub s/, H-implantation in c-Si, and Si-H bonding vs. P/sub H2/ and T/sub s/ lead to a more complete picture of bombardment and thermal processes in a-Si:H film formation.

THIN-FILM POLYCRYSTALLINE SILICON SOLAR CELLS Final Report, 15 Apr. 1980 - 15 Apr. 1981
Amal K. Ghosh, Tom Feng, Daniel J. Eustace, and H. Paul Maruska Jul. 1981 78 p refs
(Contracts DE-AC02-77CH-00178; SERI XJ-0-9077-1)
(DE82-000633; SERI/TR-9077-T3) Avail: NTIS HC A05/MF A01

The highest efficiencies achieved with single crystals are 14.1% for ITO/n-Si and 13.3% of SnO2/n-Si, while the corresponding values for polysilicon are 11.2% and 10.1%. For large area single crystal devices the efficiency values are 11.7% and 11.2% for ITO and SnO2 cells, respectively, while for polysilicon the corresponding values are 9.82% and 9.55%. The lower efficiency for large area devices is mainly due to lower J sub sc and FF. Results are presented to show the optimum grid spacing required. From stability studies it is shown that there are two distinct mechanisms for degradation, one optical and the other thermal. The optical degradation could be eliminated if the cells could be protected from UV light and the thermal degradation can be prevented if the cells are operated below 100 C.

COMPARISON OF GROUND-COUPLED SOLAR-HEAT-PUMP SYSTEMS TO CONVENTIONAL SYSTEMS FOR RESIDENTIAL HEATING, COOLING AND WATER HEATING Final Report
M. K. Choi, J. H. Morehouse, and P. J. Hughes Golden, Colo. Solar Energy Research Inst. Jul. 1981 82 p refs
(Contracts DE-AC02-77CH-00178; EG-77-C-01-4042)
(DE82-003633; SERI/TR-98288-2) Avail: NTIS HC A05/MF A01

An analysis is performed of ground-coupled stand-alone and series configured solar-assisted liquid-to-air heat pump systems for residences. The year-round thermal performance of these systems for space heating, space cooling, and water heating is determined by simulation and compared against non-ground-coupled solar heat pump systems as well as conventional heating and cooling systems in three geographic locations: Washington, DC; Fort Worth, Texas; and Madison, Wisconsin. The results indicate that without tax credits a combined solar/ground-coupled heat pump system for space heating and cooling is not cost competitive with conventional systems. Its thermal performance is considerably better than non-ground-coupled solar heat pumps in Fort Worth. Though the ground-coupled stand-alone heat pump provides 51 percent of the heating and cooling load with non-purchased energy in Fort Worth, its thermal performance in Washington and Madison is poor. (Contract DE-AC03-78CS-31217)
(DE82-003000; DOE/CS-31217/T7) Avail: NTIS HC A05/MF A01

The solar facility utilizes 35 collectors with a total aperture area of 8960 sq ft. The system is designed to deliver a water/ethylene glycol solution at 200 F to a heat exchanger, which, in turn, supplies water at 180 F to a rotoclave (underground tank) for the concrete block curing process. A fossil fuel boiler system also supplies the rotoclave with processed hot water to supplement the solar system. The system was operational 92.5% of the days during which the data acquisition system was functional. Sufficient solar heating was available to deliver hot water to the heat exchanger on 448 days, or 81.8% of the days on which reliable data was recorded. Total fuel saved during the three year period was 10,284 gallons. Thus, this program successfully demonstrated the technical feasibility of generating industrial process hot water with solar energy.

HELIOSTAT FIELD LAYOUT FOR SOLAR THERMAL POWER PLANTS [DIE AUSLEGUNG VON HELIOSTATFELDERN FUER SOLARTHERMISCHE KRAFTWERKE]
Hartung, Kindermann, and W. Mayer Jun. 1980 15 p refs In GERMAN; ENGLISH summary
(MBB-UR-453/80-OE) Avail: NTIS HC A02/MF A01

The calculation of the optimum distribution of heliostats, serving a solar tower collector for solar thermal power generation, is considered. A theoretical basis for the problem is posed, encompassing physical characteristics of the heliostats, their number, and intensity of the reflected radiation from each unit in function of their layout. Theoretical results lead to numerical procedures (program package TAUST). Various heliostat field configurations (project EURELIOS and GAST) are then discussed and evaluated in light of this model.

PREPARATION AND PROPERTIES OF EVAPORATED CdTe FILMS COMPARED WITH SINGLE CRYSTAL CdTe Progress Report, 1 May - 31 Jul. 1981

Richard H. Bube 1981 20 p
(Contracts DE-AC02-77CH-00178; SERI XW-1-9330-1)
(DE82-000228; SERI/PR-9330-1-T3; PR-3) Avail: NTIS HC A02/MF A01

The hot wall vacuum deposition system is discussed and is is good temperature tracking between the furnace core and the CdTe source itself are indicated. Homojunction cells prepared by HWVE deposition of n-CdTe on p-CdTe substrates show no significant change in dark or light properties after open circuit storage for the next 9 months. CdTe single crystal boules were grown with P, As and Cs impurity. For P impurity it appears that the segregation coefficient is close to unity, that the value of hole density is controlled by the P, and that growth with excess Cd gives slightly higher values of hole density than growth with excess Te. CdTe:As crystals appear similar to CdTe:P crystals. DOE

HYDROGEN

Includes hydrogen production, storage, and distribution.

A82-19449 The sulfur thermochemical cycle for hydrogen production. M. Dokiya (National Chemical Laboratory for Industry, Yatabe, Ibaraki, Japan). *Energy Developments in Japan*, vol. 4, July 1981, p. 31-42. 18 refs. Translation.

Results of research on sulfur-cycle hydrogen production are presented. An H2S cycle using MoS2 as a catalyst is mentioned as showing promise for thermochemical water splitting, with an equilibrium reaction yield of 7%. Use of I or Pt as catalysts raised efficiencies to 16 and 12%, respectively, and further studies employing hybrid cycles with CO2-S and noble metals are reviewed. Thermal decomposition reactions with sulfuric acid are examined, noting a potential 30% thermal efficiency, and sulfur cycle research being undertaken at various industrial laboratories is outlined. It is noted that experiments with sulfuric acid salts for water electrolysis at Los Alamos will probably use solar collectors as a heat source.

A82-20075 Photoresponse of n-type semiconductor NiTiO3. P. Salvador (Consejo Superior de Investigaciones Cientificas, Instituto de Catálisis y Petroleoquímica, Madrid, Spain), C. Gutierrez (Consejo Superior de Investigaciones Científicas, Instituto de Química Física, Madrid, Spain), and J. B. Goodenough (Oxford University, Oxford, England). *Applied Physics Letters*, vol. 40, Jan. 15, 1982, p. 188-190. 8 refs.

The 60-Hz photocurrent of 1,000-ohm cm, Nb-doped n-TiO3 has been measured by lock-in amplification as a function of wavelength and applied potential. NiTiO3 is oxidized anodically in the dark producing Ni(2 plus) ions in solution; however, this corrosion is but a fraction of the total charge passed either with visible or UV light, which indicates that photogenerated holes are able to oxidize water. The spectral response is shifted towards the visible region, as compared with TiO2, and the flatband potential is 0.4 V more negative than that of the H(plus)/H2 redox couple, which would make possible the use of NiTiO3 for water photoelectrolysis. However, the quantum efficiency for visible light is much lower than that for UV light, primarily because of low oscillator strength for the visible light Ni(2 plus)-Ti(4 plus) charge transfer excitation in this structure.

A82-20137 The prospects for liquid hydrogen fueled aircraft. G. D. Brewer (Lockheed-California Co., Burbank, CA). *International Journal of Hydrogen Energy*, vol. 7, no. 1, 1982, p. 21-41. 12 refs.

It is pointed out that an alternative fuel for transport aircraft must be either producible or available anywhere in the world. It is contended that this requirement can be met by liquid hydrogen because it can be produced from water using any locally available energy source. It is not dependent on the availability of fossil resources. With conventional production technologies, LH2 may cost more per unit energy than hydrocarbon alternatives. Because of the weight advantage, however, aircraft using LH2 will be more efficient and their direct operating costs will be competitive. It is shown that, with advanced technologies, LH2 can provide cost and energy advantages. A plan to develop LH2 technology on an international basis is proposed.
C.R.

A82-20138 Comparison of the expenses required for the on-board fuel storage systems of hydrogen powered vehicles. C. Carpetis (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für technische Physik, Stuttgart, West Germany). *International Journal of Hydrogen Energy*, vol. 7, no. 1, 1982, p. 61-77. 8 refs.

The on-board storage of hydrogen in vehicles requires sophisticated tank systems and appreciable energy expenditure. The energy requirement for the loading of liquid hydrogen in a cryogenic storage tank is substantially higher than the amount needed to charge a corresponding hydride vehicle tank. However, the hydride tank must provide a considerable part of its hydrogen fuel energy content in order to meet the energy requirements due to its own weight. This amount increases rapidly with increasing design range. Considering the total primary energy flow for both cases, it turns out that a clear break-even point exists. For design ranges higher than about 200 km the liquid hydrogen storage requires less energy expense than the hydride storage tank, the difference being very substantial (more than 100%) in the usual 400-600 km range. Similar results are found in the costs of the on-board storage of hydrogen for different design ranges. A comparison of these results with the storage costs studied earlier for large-scale stationary hydrogen storage facilities indicates that, from the specific capacity point of view, the break-even conditions are very similar in both cases, although due to different reasons.

A82-21194 Replacement of fossil fuels by hydrogen. R. Dahlberg (Telefunken AG, Heilbronn, West Germany). *International Journal of Hydrogen Energy*, vol. 7, no. 2, 1982, p. 121-142. 26 refs.

The replacement of fossil fuels by solar hydrogen plantations is considered. A model is proposed in which ten plantation families, situated in suitable deserted zones of the world after the year 2000, would generate enough electrical energy to produce solar cells and materials for the construction of ten new plantations within a decade. The technological growth process for identical solar plantation units could be completed about 50 years after construction of the first plantation. All ten plantation families would, by using their electrical energy for the electrolysis of water, generate an amount of hydrogen per year which is four to five times the energy of the world's present annual consumption of oil. This concept envisions the global replacement of fossil fuels by hydrogen within a period consistent with the remaining time span of fossil fuel availability. Storage and transportation of hydrogen would be economical, and the energy produced would not present any environmental problems. Advantages with respect to gains in international cooperation, world peace, and world economy are also discussed.
J.F.

A82-21196 Estimation of storage costs for large hydrogen storage facilities. C. Carpetis (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für technische Physik, Stuttgart, West Germany). *International Journal of Hydrogen Energy*, vol. 7, no. 2, 1982, p. 191-203. 10 refs.

The paper presents an economic evaluation of alternative hydrogen storage methods (pressurized gas, metal hydride and cryogenic storage) for large stationary (utility-scale) applications. The presentation of cost calculation clarifies the importance and influence of a set of relevant parameters depending on the charging-discharging schedule, the relation of the capacity to power level, etc. The results presented define the useful range of application for each storage method, whereas the corresponding cost composition (power related capital costs, capacity-related capital costs, energy costs) is analyzed and discussed.

A82-21649 Gas producing process for large quantities of hydrogen (Gaserzeugungsverfahren für grosse Wasserstoffmengen). K. J. Mundo (Uhde GmbH, Dortmund, West Germany). *Brennstoff-Wärme-Kraft*, vol. 34, Jan. 1982, p. 15-21. 15 refs. In German.

Due to the Federal Republic of Germany's energy economy change-over from oil to other energy carriers, hydrogen will be playing a larger part, and large hydrogen plants will be required for the production of the necessary quantities of liquid hydrocarbons from coal. The development of synthesis gas requirements is estimated for important ranges of application in the next two decades, and the possibilities of satisfying these requirements are discussed in terms of the present state of engineering, assuming that various developments can be successfully concluded. The efficiency of the process for production of larger quantities of hydrogen, and manufacturing costs are also discussed and compared with other forms of energy.
D.L.G.

A82-23782 Photoelectrolysis at Fe2O3/TiO2 heterojunction electrode. F.-T. Liou, C. Y. Yang (Brookhaven National Laboratory, Upton, NY), and S. N. Levine (New York, State University, Stony Brook, NY). *Electrochemical Society, Journal*, vol. 129, Feb. 1982, p. 342-345. 13 refs. Research sponsored by the U.S. Department of Energy.

The fabrication of a heterojunction consisting of a thin film of n-type polycrystalline TiO2 deposited on n-type polycrystalline Fe2O3 to form an anode which can photodecompose water in the presence of light is reported. It has been found that under illumination, incident light passes through the TiO3 film and generates holes in the underlying Fe2O3 which, under an appropriate bias, contribute to the electrode reaction of the TiO2/electrolyte interface. The discontinuity at the conduction bands is estimated to be 0.38 eV and at the valence bands, 0.42 eV, which presents an energy barrier to the migration of holes from the Fe2O3. Tests involving CVD TiO2 films on Fe2O3 substrate were performed under 550 C to avoid formation of iron titanates. A photoresponse initiated at 560 nm indicated a hole contribution from the Fe2O3 substrate.

A82-24796 **Liquid hydrogen for space flight - The long step from proposal to reality.** J. L. Sloop (International Consultants on Energy Systems, Bethesda, MD). *Journal of the Astronautical Sciences*, vol. 29, Oct.-Dec. 1981, p. 373-381. 8 refs.

A series of technological advancements has made it practical to use liquid hydrogen in manned and unmanned space vehicles. These developments and their implications are discussed in detail. They include (1) the liquefaction of gases, their storage and handling; (2) the demonstration that a liquefied gas could be used successfully in rocket flights; (3) the development of lightweight and large rocket structures; and (4) aircraft and rocket experiments with liquid hydrogen. It is concluded that liquid hydrogen will be used not only for space boosters, but for aircraft, cars, trucks, and buses as well. Proposals to generate hydrogen by nuclear and solar energy are also under investigation.

A82-25778 **Hydrogen production by immobilized cells. I - Light dependent dissimilation of organic substances by Rhodopseudomonas palustris.** M. Vincenzini, R. Materassi, M. R. Tredici, and G. Florenzano (Firenze, Università, Florence, Italy). *International Journal of Hydrogen Energy*, vol. 7, no. 3, 1982, p. 231-236. 12 refs.

A82-25779 **Hydrogen by water electrolysis as basis for small scale ammonia production - A comparison with hydrocarbon based technologies.** T. Grundt and K. Christiansen (Norsk Hydro A/S, Oslo, Norway). *International Journal of Hydrogen Energy*, vol. 7, no. 3, 1982, p. 247-257. 5 refs.

The Norsk Hydro elctrolyzer technology is described, along with comparisons of ammonia production using different feedstocks and inherent costs and efficiencies. The electrolyzers are bipolar filter press types with electrodes, diaphragm, and gaskets sandwiched together in each cell with an area of 2.1 sq m. A one-cell load is 1700 A/sq m for a total load of 3600 A, and 235 cells are placed in each electrolyzer. An electrolyte composed of 25% KOH is used, and electrolyzer units have initial efficiencies of 98%, falling off at the rate of 1% every 4 yr, due to stray-currents in the lye and gas ducts and some recombination. The production of 1/2 ton of NH3 is noted to require 1970 cu m of H2 and 657 cu m of N, and the formation process is reviewed. The use of hydrocarbon feedstocks such as natural gas, naphtha, fuel oil, and coal is considered, especially for the gasification of coal, and NH3 formation is shown to be competitive with reforming and partial oxidation processes. M.S.K.

A82-25780 **The Daimler-Benz hydride vehicle project.** H. Buchner and R. Povel (Daimler-Benz AG, Stuttgart, West Germany). *International Journal of Hydrogen Energy*, vol. 7, no. 3, 1982, p. 259-266.

Thirty passenger cars with hydrogen and hydrogen/gasoline hybrid operation and TiFe hydride tanks will be tested in Berlin. A central refueling station will deliver pure hydrogen derived out of the town gas network. High and low temperature hydride tanks will be tested in some vans and passenger cars in Stuttgart. An individual refueling station with integrated heat recovery will demonstrate the possibility of using existing energy infrastructures (electricity, gas) for hydrogen production.

A82-25781 **Use of hydrogen in dual-fuel engines.** G. Gopal, P. S. Rao, K. V. Gopalakrishnan, and B. S. Murthy (Indian Institute of Technology, Madras, India). *International Journal of Hydrogen Energy*, vol. 7, no. 3, 1982, p. 267-272.

The dual-fuel method is the easiest and most flexible method for using hydrogen in a diesel engine. In this work, a conventional single cylinder, four-stroke diesel engine has been converted to work on the dual-fuel principle with hydrogen as the inducted fuel. The main objectives of the investigation were to determine the optimum proportions between hydrogen and diesel oil under various engine operating conditions and to study the combustion process in the engine under these conditions. The results show that very satisfactory dual-fuel operation with hydrogen is possible. The thermal efficiencies obtained were comparable with pure diesel operation and up to about half the engine's energy requirement could be derived from hydrogen. The chief problem noticed is that of knocking setting in well before the stoichiometric hydrogen-air ratio. This requires further research for rectification.

A82-26586 * **Hydrogen uses and demands through the year 2025.** J. H. Kelley (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA), W. J. D. Escher (Escher-Foster Technology Associates, St. Johns, MI), and W. van Deelen (Commission of the European Communities, Brussels, Belgium). *Chemical Engineering Progress*, Jan. 1982, p. 58-61. Research supported by the U.S. Department of Energy and NASA.

The magnitude and markets for applications of hydrogen produced by water-splitting through thermal or electrolytic means are projected up to the year 2025. Uses are divided into energy and nonenergy categories, with U.S. synfuels programs accounting for 66% of the increased demand for hydrogen. Applications for transportation fuel, as a natural gas supplement, in fuel cells, in refinery and synfuels industries, for synthesizing chemicals, and for manufacturing semiconductors are summarized. Electrolytic processes are noted to be more suitable for smaller scale production, where use is on-site or local. An annual growth of 8.4-9.2% is foreseen in the energy sector and 3-3.6% in the nonenergy sector, with a total contribution to the primary energy uses of 12-13% by the year 2025. Hydrogen's negligible environmental impact and the ability to interface hydrogen systems with existing equipment are seen as factors encouraging hydrogen-use growth.

SYSTEMS ANALYSIS OF H2/NATURAL GAS SUPPLEMENTATION AND SEPARATION
M. Beller and J. DAcierno 1981 5 p refs Presented at Ann. Contractors' Rev. Meeting on Thermal and Chem. Storage, Tysons Corner, Va
(Contract DE-AC02-76CH-00016)
(DE81-030031; BNL-29962; CONF-810940-3) Avail: NTIS HC A02/MF A01

A systems analysis of the concept of supplementing natural gas with hydrogen was conducted in terms of present fuel supplies and prices. An added option was analyzed; this involves separation of the hydrogen from the mixed stream for use as a nonenergy commodity. The study concludes that no insurmountable barriers exist for the supplementation concept; the separation option will depend only upon economic factors.

AN ASSESSMENT OF THE CRASH FIRE HAZARD OF LIQUID HYDROGEN FUELED AIRCRAFT Final Report
Feb. 1982 132 p refs
(Contract NAS3-22482)
(NASA-CR-165526; ADL-85161) Avail: NTIS HC A07/MF A01 CSCL 01C

The crash fire hazards of liquid hydrogen fueled aircraft relative to those of mission equivalent aircraft fueled either with conventional fuel or with liquefied methane were evaluated. The aircraft evaluated were based on Lockheed Corporation design for 400 passenger, Mach 0.85, 5500 n. mile aircraft. Four crash scenarios were considered ranging from a minor incident causing some loss of fuel system integrity to a catastrophic crash. Major tasks included a review of hazardous properties of the alternate fuels and of historic crash fire data; a comparative hazard evluation for each of the three fuels under four crash scenarios a comprehensive review and analysis and an identification of areas further development work. The conclusion was that the crash fire hazards are not significantly different when compared in general for the three fuels, although some fuels showed minor advantages in one respect or another

FUELS AND OTHER SOURCES OF ENERGY

Includes fossil fuels, nuclear fuels, geothermal and ocean thermal energy, tidal energy, and wind energy.

A82-19120 **Special purpose anemometry for wind power studies.** U. Hassan (ERA Technology, Ltd., Leatherhead, Surrey, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 166-193. 12 refs.

Three relatively low-cost anemometric devices suitable for certain applications in wind power studies are described. The Tatter Flag is made of cotton, is 30 x 38 cm in size, and measures winds by the amount of tattering in the flag. A linear correlation with mean wind speed has been shown to exist, with a certainty of 0.87. Obvious disadvantages such as cattle eating the flag are noted. The TALA (Tethered Aerodynamic Lifting Anemometer) kite senses the aerodynamic force on the kite with a tension gage on the tether line. The tension is calibrated in speed, and the height of the kite is determined from the length of the line and the angle of the kite. The TALA kite is used to make rapid assessment of local flowfields. Finally, the ERA GUST anemometer comprises a perforated sphere on a vertical tube fastened at the bottom to a strain gage bridge circuit. An electrical signal proportional to the gust load provides accurate short term gust behavior. M.S.K.

A82-19975 **Recycling World Congress, 3rd, Basel, Switzerland, September 29-October 1, 1980, Proceedings. Sessions 1-2 /Day 1/, Sessions 3-4 /Day 2/, and Sessions 5-6 /Day 3/.** Oxted, Surrey, England, Recycling World Congress, 1980. Sessions 1-2 /Day 1/, 134 p.; Sessions 3-4 /Day 2/, 113 p.; Sessions 5-6 /Day 3/, 117 p. $108.25; price of three volumes, $256.50.

The recovery of useful products from refuse was examined in terms of the use of research waste to produce heat, the generation of CH_4 from waste, pyrolysis resource recovery, and fuel production from municipal solid waste. The fabrication of building blocks from cement and asbestos factory wastes was discussed, along with the production of ferro-chromium from slags and the use of secondary lead. Attention was also given to recycling metallic incinerator waste, the pyrolysis of plastic wastes scrap in a fluidized bed, and recycling discarded tires as fuel for a cement plant. Various treatments for the reuse of municipal trash were explored and the recovery of usable chemical wastes was described. Sewage sludge and household wastes were investigated for useful products, compost wastes were chemically analyzed, especially for heavy metals, and methods of recycling plastics in all forms were presented. M.S.K.

A82-20256 **Biological sources of energy from the sea.** E. J. Phlips. *Sea Frontiers*, vol. 28, Jan.-Feb. 1982, p. 36-46.

The use of marine plants and microscopic organisms as possible future energy sources is examined. Parallels are drawn between the coming depletion of fossil fuel resources and the first energy crisis on earth, when evolving cells began to use up the stores of organic molecules in the ocean, and photosynthesis, in the form of plant biomass, is considered as a possible solution to the present energy crisis. The energy potential of marine biomass, specifically the seaweeds, microscopic algae and photosynthetic bacteria, is then assessed, and experimental attempts at the culturing of such organisms, are noted. Microbial energy technologies, principally the replacement of chemical processes requiring fossil fuels with biological conversion systems and direct biomass conversion into hydrogen and methane fuels, are then examined. Possible applications of techniques involving genetic engineering and cell-free systems to future bioenergy research are indicated, and the impetus to the rapid development of solar energy posed by the problems of pollution and availability of present energy sources is emphasized. A.L.W.

A82-22196 † **The use of Doppler spectroscopy to study the characteristics of the polydisperse characteristics of emulsion water and solid microimpurities in aviation fuels (Primenenie metoda Doplerovskoi spektroskopii dlia issledovaniia kharakteristik polidispersnosti emul'sionnoi vody i tverdykh mikroprimesei v aviatoplivakh).** A. N. Korolevich, T. V. Oleinik, and A. Ia. Khairullina. *Zhurnal Prikladnoi Spektroskopii*, vol. 35, Dec. 1981, p. 1016-1023. 11 refs. In Russian.

The feasibility of using Doppler spectroscopy to determine drop sizes of emulsion water and particle sizes of solid microimpurities in kerosene flow through a pipe is confirmed. Measured Doppler spectra are used to reconstruct particle size distribution functions for fractions of microparticles beginning with 2 microns. The method makes possible the rapid continuous monitoring of the disperse phase in aviation fuel and may be suitable in the automated analysis of multicomponent disperse media. B.J.

A82-23238 * **Deposit formation in liquid fuels. III - The effect of selected nitrogen compounds on diesel fuel.** J. H. Worstall, S. R. Daniel, and G. Frauenhoff (Colorado School of Mines, Golden, CO). *Fuel*, vol. 60, June 1981, p. 465-467. 11 refs. Grant No. NsG-3122.

The influence of substituted quinolines, pyrroles, indoles, and pyridines on deposit formation in a diesel fuel is evaluated. Significant increases in deposition rate are found which are dependent upon the basicity of the nitrogen compound within a given compound class. These effects correspond closely with those produced in a Jet A fuel. Removal of highly polar fuel components renders the nitrogen compound influence inoperative. These components are therefore participants in deposit-forming reactions. (Author)

A82-23817 **Exergetic analysis of complex multimaterial processes using nuclear coal gasification as an example (Exergetische Analyse komplexer Mehrstoffprozesse am Beispiel der nuklearen Kohlevergasung).** R. Pruschek (Universität Essen-Gesamthochschule, Essen, West Germany) and F. K. Boese (INTERATOM, Internationale Atomreaktorbau GmbH, Bergisch Gladbach, West Germany). *Brennstoff-Wärme-Kraft*, vol. 33, Oct. 1981, p. 404-411. 22 refs. In German. Research supported by the Bundesministerium für Forschung und Technologie.

A comprehensive exergetic analysis is presented for several variants of nuclear coal gasification. The analysis is based on the availability and costs of energy carrier coals and on the rising costs of energy production. In particular, the exergy of chemically reacting materials as well as of mixtures is calculated, and evaluation quotients are computed. Nuclear coal gasification for several gasification possibilities using ligneous and bituminous coals is also examined. J.F.

A82-23819 # **Injection and thermal breakthrough in fractured geothermal reservoirs.** G. S. Bodvarsson and C. F. Tsang (California, University, Berkeley, CA). *Journal of Geophysical Research*, vol. 87, Feb. 10, 1982, p. 1031-1048. 44 refs. Contract No. W-7405-eng-48.

Reinjection of geothermal wastewater is gradually becoming a preferred means of waste disposal. Fluid movement in most geothermal reservoirs is controlled by fracture. The considered investigation has the objective to study the advancement of the thermal front during injection into a fractured reservoir system. A

reservoir system consisting of equally spaced horizontal fractures intersecting an injection well is considered. A rather simple mathematical model is developed and solved analytically. Numerical calculations are carried out in order to investigate the importance of the assumptions employed in the analytical study and extend the applicability of the results. The results from the analytical work are given in the form of type curves which can be used to design the locations of the injection wells with refererence to the production wells and the injection rate. G.R.

A82-23950 Processes for reducing emissions of particulates and oxides of sulfur and nitrogen for various coal utilization alternatives. R. J. Farrell (Scientific Design Co., Inc., New York, NY) and E. N. Ziegler (New York, Polytechnic Institute, Brooklyn, NY). In: Advances in environmental science and engineering. Volume 4. New York, Gordon and Breach Science Publishers, 1981, p. 46-75. 80 refs.

Problems connected with an increased use of coal as substitute for other fuels are partly related to environmental pollution considerations. A review is conducted of the status of both the current options and emerging technologies with respect to removal of the primary pollutants, including particulates, SO2, and NOx. It is found that utility installations which control particulates at coal combustion sites typically use electrostatic precipitators. Those which control SO2 typically use flue-gas desulfurization units. Tighter emission controls will substantially increase the application of filters, regenerative flue gas desulfurization processes and dry-sorption processes for SO2 removal, and new burner designs and post combustion denitrification for NOx control. Strong incentives exist for the development of a 'breakthrough' in a number of areas. Fluidized-bed combustion or the combustion of solvent-refined coal will each capture portions of the utility market. The employment of coal-liquefaction processes appears probable. G.R.

A82-24059 Oceans '80; International Forum on Ocean Engineering in the '80s, Seattle, WA, September 8-10, 1980, Conference Record. Forum sponsored by the Institute of Electrical and Electronics Engineers. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. 566 p. Members, $35.; nonmembers, $46.67.

Engineering applications for the development of ocean and shoreline based technologies are reviewed. Attention was given to the use of instruments such as automatic profiling equipment, surf transducers, and acoustic measuring equipment for ocean phenomena. Various ocean-based resources were investigated, including thermal stratification, wave power, and minerals. Advancements in arctic based ships and ports were discussed, as were topics of navigation and safety, undersea engineering, and characteristics of new submersibles and underwater bases. Techniques for measuring the performance of current measuring devices were examined, along with marine weather systems, methods of oil spill clean-up, and underwater communications systems. Finally, power systems for ships were outlined, and environmental studies of the ocean and methods of applications of Seasat data were explored. M.S.K.

A82-24296 Corrosion of stainless steels in the geothermal environments of the Salton Sea known geothermal resource area. J. P. Carter, S. D. Cramer, and R. K. Conrad (U.S. Bureau of Mines, Avondale, MD). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 15 p. 20 refs.

A82-24297 Geothermal power plant corrosion experience - A global survey. P. F. Ellis, II and D. M. Anliker (Radian Corp., Austin, TX). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 21 p. 30 refs. Research supported by the U.S. Department of Energy.

An overview of corrosion experience from a number of operating geothermal power plants around the world is presented. These power plants are located in six countries and utilize vapor or liquid dominated resources. General plant descriptions and process stream chemistries are presented, and each subsystem of the geothermal power system is considered for its unique corrosion problems. The subsystems discussed are wells, two-phase flow systems, steam transmission systems, turbines, gas extractors, and heat rejection system (condensers, piping, valves, pumps, cooling towers, and concrete structures). Atmospheric corrosion effects on painted structures, electrical components, and power transmission lines are also discussed. Materials and components which have failed as well as those which have been successful are identified. (Author)

A82-24381 Crude sources and refining trends and their impact on future jet fuel properties. N. R. Sefer and C. A. Moses (Southwest Research Institute, San Antonio, TX). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811056.* 17 p. 21 refs. Contract No. N00140-80-C-2289.

Jet fuel properties which would influence future availability or cost of JP-5 supplied to the Navy are determined. Significant fuel properties are identified for jet fuel produced from oil shale and coal to develop an alternate test procedure for qualifying new aviation turbine fuels. The availability of JP-5 could be improved by relaxing the freezing point specification to broaden the selection of suitable crudes or broaden the boiling range from a given crude. JP-5 can be made from shale oil with properties that meet current specification, and coal liquids are high in aromatics, low in hydrogen content, and require moderate to high severity hydrogenation. The kerosene fraction will meet JP-5 specifications after most of the aromatics are hydrogenated. D.L.G.

A82-24584 # The rotating heat pipe - Implementation as a uniform-temperature heat source. R. F. Limoges (Eastman Kodak Research Laboratories, Rochester, NY). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/HT-2.* 6 p. 7 refs. Members, $2.00; nonmembers, $4.00.

A wickless rotating heat pipe, if properly controlled, is a uniform heat source. The data presented are based on work done with 12.7 cm diameter x 76 cm long rotating heat pipes operating between 120 and 140 C. The major areas reviewed are: materials of fabrication, working fluids, sealing, temperature control, heaters, and safety. The optimum rotating heat pipe defined by these studies is fabricated of type 304 stainless steel, uses water as the working fluid, is sealed with welded joints, and utilizes a pressure switch and a fast-response quartz lamp for temperature control. Surface-temperature control of + or - 0.15 C and temperature uniformity within 0.8 C are obtained. Results of experiments designed to study the effects of hydrogen in the enclosed volume of the heat pipe are presented. (Author)

A82-24684 Synthetic, coal-derived fuels. G. R. Hill (Utah, University, Salt Lake City, UT). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 19-23. 8 refs.

Liquefaction and gasification processes for increasing the usage of coal are reviewed, noting their importance as an interim energy source until fusion and solar technologies are suitable for all energy requirements. Coal is ranked from anthracites to hydrogen-free graphites, with bituminous coals containing the lowest water concentrations relative to resource size and availability. Current processes for converting coal to gas or liquid are outlined, including high and low temperature carbonization, hydropyrolysis, liquid-phase hydrogenation, and reactions with oxygen or steam to produce syngas. The Fischer-Tropsch process permits the production of methanol, ethanol, methane, and hydrogen to replace gasoline. Finally, gasification processes are examined in terms of fixed bed, entrained flow, fluidized bed, and integrated high Btu gas processes, all currently performed at precommercial levels of operation. M.S.K.

A82-24691 Pacific Gas and Electric Company - Biomass energy activities. M. J. Blanchet, B. M. Jenkins, J. G. Meyer, P. Maciel, and R. F. Goldstein (Pacific Gas and Electric Co., San Francisco, CA). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 99-104. 11 refs.

Pacific Gas and Electric activities in utilizing biomass for the production of gas and electricity are reviewed. Research is centering

on quantifying the available resource, identifying viable conversion systems, determining the economics, and defining limiting factors such as balances between competing alternatives and institutional restraints. A feasibility study for a pyrolysis plant for producing syngas from San Francisco solid waste streams is detailed, along with studies of the forest and crop residues within a 50 mi radius of a subjective plant site. Current projects include a landfill gas recovery system for gas injection into the company lines, a biogas digester at a beef feedlot for processing one dry ton of manure/day, and purchases of cogenerated power from industrial concerns burning wood residue, walnut shells, pelleted wood, garbage, grape pommace, and cotton gin trash. Open ocean kelp farms are noted for future study. M.S.K.

A82-24968 Hydrocracking of coal using molten salts as catalysts. S. Kikkawa, M. Nomura, H. Sakashita, M. Nishimura, and M. Miyake (Osaka University, Osaka, Japan). *(Chemical Society of Japan, Journal,* vol. 923, no. 6, 1980.) *Energy Developments in Japan,* vol. 4, Oct. 1981, p. 183-200. 52 refs. Translation.

Characteristics of the reactions during coal liquefaction and the hydrocracking of coal and coal-related materials using ZnCl2-transition metal chloride or ZnCl2-alkaline metal chloride are discussed. The studies involve development of a molten salt catalyst for hydrocracking heavy residual oils or coals, including hydrocarbons containing many heteroatoms. It was found that ZnCl2 shows higher activity for hydrocracking of anthracene and phenanthrene, and experiments with Yubari coal using the binary metal catalysts ZnCl2-MoCl5 and ZnCl2-CrCl3 are described. The use of molten salts in the desulphurization of heavy residual oils is also explored, specifically for the hydrocracking of benziophene, and the possibility that a coal-like polymer structure containing an oxygen surplus might depolymerize above ternary melts is suggested. M.S.K.

A82-25373 Magmatic gases in well fluids aid the mapping of the flow pattern in a geothermal system. H. Armannsson, G. Gislason, and T. Hauksson (National Energy Authority, Geothermal Div., Reykjavik, Iceland). *Geochimica et Cosmochimica Acta,* vol. 46, Feb. 1982, p. 167-177. 22 refs.

Gas composition and silica concentrations of well fluids are used in conjunction with pressure, temperature and enthalpy data to obtain a model of the drilled part of the Krafla geothermal field (Northeast Iceland). A magma chamber is located at 3-8 km depth under the field. Magmatic gases emanate from the chamber and travel via a channel reaching the surface at the Hveragil eruptive fissure. The composition of the gases is apparently modified on the way, in that sulphur, which presumably is in the form of sulphur dioxide to begin with, is removed, and what remains is in the form of hydrogen sulphide. It is suggested that the major removal mechanism is the deposition of pyrite and pyrrhotite during the passage of the gases through the hydrothermal system. (Author)

A82-25468 Numerical study of wind energy characteristics over heterogeneous terrain - Central Israel case study. M. Segal, R. A. Pielke (Virginia, University, Charlottesville, VA), and Y. Mahrer (Jerusalem, Hebrew University, Jerusalem, Israel). *Boundary-Layer Meteorology,* vol. 22, Mar. 1982, p. 373-392. 35 refs. Research supported by the United States-Israel Binational Science Foundation and NSF.

A numerical mesoscale meteorological model has been applied over the heterogeneous terrain of central Israel in order to study wind energy characteristics of three typical synoptic situations. The supportive nature of this method for observationally oriented wind energy studies has been emphasized. Mesoscale forcing effects on the availability of wind energy and on the exponent, p, in the vertical wind power law are evaluated. (Author)

A82-26015 Relationship of hydrothermal phenomena within the Leinster Granite to crustal fractures delineated from Landsat imagery. P. M. Brück (University College, Cork, Ireland) and P. J. O'Connor (Geological Survey of Ireland, Dublin, Ireland). *Photogrammetria,* vol. 37, Feb. 1982, p. 151-159. 16 refs.

Landsat imagery was combined with existing geologic maps of the Leinster Granite in SE Ireland to develop a model of hydrothermal processes in the area and detect the fracture zones. Observed linears were interpreted as fractures, and satellite imagery allowed the discernment of hydrothermal alteration zones, occurrences of spodume and red-feldspar pegmatites, and explosion breccias. Pb-Zn mineralization sites displayed a spatial association with a transverse fracture system, with galena and sphalerite the main ores in veins with thicknesses ranging from a few meters to a few cm. Hydrothermal processes which may have led to the formation of the Leinster Granite are detailed, along with a suggestion that fractures occuring late in the cooling granite's history formed channels for circulating ground waters. M.S.K.

A82-26177 # Prospecting for wind energy - A field assessment of physical modelling. D. Neal and D. C. Stevenson (Canterbury, University, Christchurch, New Zealand). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 27-30. 5 refs.

The requirements for the modeling of wind characteristics over irregular terrain are examined, and laboratory measurements are discussed. The area considered in the present study is situated on Banks Peninsula in the South Island of New Zealand. The prevailing winds for this region are from the northeast and southwest. A model was constructed using 9 mm thick expanded polystyrene-bead board. This was cut to the shape of the terrain contours obtained from a photographically enlarged map. The final form of construction included the modeling of surface roughness elements on the model. The laboratory measurements were made in a 1.2 m x 1.2 m cross section boundary layer wind tunnel. Measurements of the velocity and turbulence intensity profiles were made with a field data acquisition system including fast response propeller anemometers. G.R.

A82-26004 * Ore deposits in Africa and their relation to the underlying mantle. H.-S. Liu (NASA, Goddard Space Flight Center, Greenbelt, MD). *Modern Geology,* vol. 8, no. 1, 1981, p. 23-36. 70 refs.

African magmatism is largely related to the tensional stress regimes of the crust which are induced by the hotter upwelling mantle rocks. These mantle rocks may provide emanating forces and thermal energy for the upward movements of primary ore bodies with fluid inclusions in the tensional stress regimes of the crust. In this paper, the Goddard Earth Gravity Model is used to calculate a detailed subcrustal stress system exerted by mantle convection under Africa. The resulting system is found to be correlated with the African metallogenic provinces. Recognition of the full spectrum of ore deposits in Africa that may be associated with the hotter upwelling mantle rocks has provided an independent evidence to support the hypothesis of mantle-derived heat source for ore deposits. (Author)

A82-27309 Future fossil fuels - Their utilization and incorporation in modern energy systems (Künftige fossile Brennstoffe - Ihre Nutzung und Einbettung in moderne Energiesysteme). W. Häfele, H. Barnert, and W. Sassin (International Institute for Applied Systems Analysis, Laxenburg, Austria). *DFVLR-Nachrichten,* Mar. 1982, p. 8-19. 8 refs. In German.

Investigations have been conducted regarding the world energy problem, taking into account the next 50 years. It is pointed out that fossil fuels will have to be made available during the considered period. This will be feasible. However, the acquisition of the needed fuels will have to be more and more based on 'unconventional' sources, and the fuels will become expensive. Attention is given to relations between the size of the world population and the energy problem, aspects of energy and utility, liquid hydrocarbons, fossil fuels and the desirability of a zero emission of pollutants, and local and temporal conditions regarding the utilization of fossil fuels. G.R.

A82-27635 # Seasat satellite investigation of the structure of Western Nebraska and its application to the evaluation of geothermal resources. J. Stix (Los Alamos National Laboratory, Los Alamos, NM). In: International Symposium on Remote Sensing of Environment, 15th, Ann Arbor, MI, May 11-15, 1981, Proceedings. Volume 2. Ann Arbor, MI, Environmental Research Institute of Michigan, 1981, p. 735-750. 43 refs.

Seasat synthetic aperture radar (SAR) satellite imagery was used to interpret the structural framework and, indirectly, the geothermal potential of an area in Western Nebraska. Lineaments were mapped

from the imagery and then compared to known structure. It was found that Seasat does record surface manifestations of subtle basement structures, particularly faulting. Furthermore, four areas with geothermal potential were delineated using Seasat and other data. It is stressed that more subsurface geology and geophysical data are needed before a final evaluation of the geothermal potential can be made. Seasat imagery is a useful reconnaissance exploration tool in the interpretation of regional structure within areas of little topographic relief. (Author)

A82-28130 † **Experience with a variety of studies of earth resources in the Kalmyk ASSR using space imagery (Opyt kompleksnogo izucheniia prirodnykh resursov Kalmytskoi ASSR na osnove kosmicheskoi informatsii).** I. N. El'vartynov and Iu. P. Kienko. *(Vsesoiuznaia Konferentsiia po Problemam Issledovaniia Prirodnykh Resursov Zemli i Mirovogo Okeana, Aviatsionno-Kosmicheskimi Sredstvami, Moscow, USSR, Nov. 1980.) Geodeziia i Aerofotos'emka*, no. 1, 1982, p. 23-26. In Russian.

Various applications of the remote sensing of earth resources in the Kalmyk ASSR are reviewed. These applications include structural mapping, gas and oil exploration, hydrogeology, soil studies, and the mapping of agricultural lands and pastures. B.J.

A82-28391 Temperature effects on the kinetics of the anaerobic digestion of crop residues to methane. E. C. Clausen and A. H. Shah (Tennessee Technological University, Cookeville, TN). *AIChE Symposium Series*, vol. 77, no. 210, 1981, p. 78-85. 15 refs.

Results of a study to determine the optimum temperature ranges for bacterial digestion of crop residues to methane are presented. Four 7 l plexiglass stirred tank reactors were fed sewage sludge and the temperature was varied from 35 to 60 C in 5 deg intervals to gain kinetic data. Feed concentration was tested in the range of 2-10/wt solids. Gas production was lowest at 45 C, and thermophilic digestion did not proceed until above 55 C. An analysis of the rate kinetics for a 200 metric tons/day of cornstalks methane plant was performed, and included the processing steps. Initial costs were $2.7 million for the plant, with over 50% of going for the digesters, and $803,000/yr operating expenses for collection and transport of the residue. Minimum methane costs of $0.10/1000 l of CH4 were reached at 40 C. M.S.K.

CONVERSION OF ORNL WASTE PAPER TO SUGAR USING ACID HYDROLYSIS
E. C. Clausen, A. H. Shah, P. R. Saggurti, W. P. Teichert, and M. E. Harrison 1981 34 p refs Presented at the 7th Ann. Meeting of Am. Inst. of Chem. Eng., New Orleans, Nov. 1981 (Contract W-7405-eng-26)
(DE82-000462; K/SUB-80-7994/1; CONF-811108-5) Avail: NTIS HC A03/MF A01

The Oak Ridge National Laboratory generates large quantities of waste paper that is presently being landfilled. Three processes were investigated in the laboratory for acid hydrolyzing this waste paper to glucose which may be later fermented to ethanol for fuel. Laboratory yields and operating conditions for a high temperature dilute acid process, a concentrated acid process and a process which utilizes waste acid are presented. DOE

FLASH HYDROPYROLYSIS OF WESTERN KENTUCKY NO. 9 BITUMINOUS COAL WITH CATALYST Final Technical Progress Report
31 Mar. 1981 254 p refs
(Contract DE-AC22-79ET-14943)
(DE81-029831; DOE/ET-14943/T1) Avail: NTIS HC A12/MF A01

The effects of selected catalysts on liquefaction of caking and noncaking pulverized coals were investigated. With caking coals, the free fall flash hydropyrolysis reactor operated satisfactorily between temperatures of 1250 to 1550 F and between 900 to 950 F with and without catalyst additions. Noncaking coals could be treated at all ranges of temperatures with or without catalyst additions. Up to two pounds per hour of coal and four pounds per hour of hydrogen were fed into the reactor. Of the catalysts tested, zinc chloride proved most effective, but only at low temperature of about 900 F. At temperatures of 1250 to 1450 F, zinc chloride, as well as other catalysts, proved to be ineffective. At 1400 to 1450 F and 1000 psig with 0.5 seconds solids residence time, about 47 percent of the carbon in caking coals were converted into useful gas and liquid products: 10 percent BTX, 7 percent light oil, 10 percent heavy oil, 27 percent total oil, 12 percent methane, 8 percent ethane, and 20 percent total gas. DEVELOPMENT OF POTENTIAL USES FOR THE RESIDUE FROM FLUIDIZED-BED-COMBUSTION PROCESSES Quarterly Technical Progress Report, Mar. - May 1981
L. John Minnick 1981 30 p
(Contract DE-AC21-77ET-10415)
(DE81-030157; DOE/ET-10415/T4) Avail: NTIS HC A03/MF A01

Evaluation of the solid wastes from fluidized bed combustion for potential commercial uses is described. Methods by which the material can be safely disposed of should commercial applications be slow in developing were explored. It was shown that spent bed materials from atmospheric fluidized bed (AFB) boilers are potentially useful in a number of commercial applications. AFB residue materials from different sources do contain a substantial component of reactive lime which can, after proper processing, be concentrated and effectively separated from the residue. Spent bed materials also exhibit unusual cementitious properties when used as received or after processing in certain construction related compositions. Evaluation of a number of different sources of AFB residue in the following areas of research was emphasized in the study: (1) characterization of AFB by-product materials; (2) determination of most effective means of beneficiation or separation of materials; (3) laboratory evaluation of the feasibility for use of AFB residue in such applications as a lime substitute, neutralization of acidic trade wastes, flue gas desulfurization, and the stabilization of highly plastic soils; and (4) performance testing of commercial applications involving some cementitious activity. CHARACTERISTICS OF COAL/LIGHT HYDROCARBON SLURRIES IN SPRAY COMBUSTION Semiannual Progress Report, 1 Mar. - 31 Aug. 1981
W. L. Grosshandler, Clayton T. Crowe, and Jacob N. Chung Sep. 1981 23 p refs
(Contract DE-FG22-80PC-30216)
(DE82-000387; DOE/PC-30216/T2) Avail: NTIS HC A02/MF A01

The status of the atomization process, recirculation within the droplet, and the combustion of coal/vaporized fuel in a diffusion burner is discussed. The droplet spray apparatus was

completed and checked out for mixing effectiveness and spray uniformity. Initial runs with pure methanol were completed. Preliminary tests were run with slurries composed of 15% and 30% mixtures of coal in liquid with mean particle sizes of 50 and 150 (Sigma)m. Analysis of the data shows small increases in Sauter mean diameter due to the presence of coal particles. The equations of motion for coal particles translating inside a circulating light hydrocarbon were developed. A computer program has been written to solve for the particle motion numerically. Particle trajectories and general distribution patterns are predicted. The combustion facility was designed and built. Initial testing to assess the stability and flatness of the reaction zone is described. Both a spouted bed and fluidized bed feeder were built to control the mass flow of coal to the burner, and the stability and flow rate of each are being assessed. DOE

DEVELOPMENT AND APPLICATION OF ANALYTICAL TECHNIQUES TO CHEMISTRY OF DONOR SOLVENT LIQUEFACTION Quarterly Progress Report, Jul. - Sep. 1981
H. C. Dorn and L. T. Taylor Oct. 1981 29 p refs
(Contract DE-AC02-89PC-30041)
(DE82-001076; DOE/PC-30041/T7) Avail: NTIS HC A03/MF A01

The quantitation and speciation of organically bound trace metals in coal liquefaction soluble products presents a real challenge. Quantitation methods have been minimal and have involved single element analysis via atomic absorption spectrometry (AAS) or multi-element analysis via inductively coupled plasma atomic emission spectrometry (ICP-AES) both on acid digested aqueous-based matrices. These methods have not proven highly satisfactory because acid digestion introduces, in some cases, a substantial blank value, requires a great amount of time and in the AAS case provides for only single element determinations with mandatory background correction. Elimination of the sample step preparation coupled with use of ICP-AES seems highly attractive for trace multielement quantitative analysis of coal liquefaction products. We have recently established the capability for metal detection in an organic matrix. DOE

POTENTIAL ECONOMIC BENEFITS FROM PROCESS CONTROL OF COAL PREPARATION PLANTS
N. C. Bradley, G. O. Allgood, and J. C. Moyers Oct. 1981 55 p refs
(Contract W-7405-eng-26)
(DE82-000881; ORNL-5738) Avail: NTIS HC A04/MF A01

In practically all US coal preparation plants, the machines and instrumentation and control devices are manually operated to clean the run-of-the-mine coal of mud, rock, and other contaminants that are removed from the earth with the desired product. The result is a large loss of a valuable natural resource. Based on 1978 production figures, 10 million tons of discarded coal could have been saved by on-line measurement and control techniques. Measurement sensors for on-line control of coal cleaning process should be developed because there are no commercial, moderate-cost sensors of medium accuracy (5 to 10 percent) available for such applications. An expenditure of approximately $10 million to develop measurement sensors and process control techniques for coal preparation would be recovered by the conservation of coal. DOE

Preliminary theoretical and experimental analyses of fracture propagation in a nonuniform stress field were performed. Preliminary analyses of fluid flow in apertures were completed. The mechanical properties of some of the core material from Mesaverde sandstones and shales from wells in Wyoming and Colorado were characterized. The feasibility of ultrasonic techniques in measuring in-situ stresses was investigated. Development of a transducer package to test the measurements in a borehole, and techniques to evaluate and interpret measurements are described. The effect of stress on velocity anisotropy was investigated. Geologic studies relating in-situ stresses to geologic structure and examining the effects of pore pressure increases on fracturing in the Green River Basin due to gas generation were performed. DOE

(DE82-000223; DOE/ET-14705/22) Avail: NTIS HC A07/MF A01

At present, the major development effort is concentrated on gasification. As is typical for developmental projects of this magnitude, a large number of operating difficulties have been experienced and overcome since the first operations in August of 1976. Currently the overcoming of operating difficulties still requires some effort. However, most tests are stable and allow the gathering of process design data in the form of validated heat and material balances. These are applied in model simulations of gasifier operation. DOE

REVERSIBILITY OF COAL LIQUEFACTION
M. G. Thomas, T. C. Bickel, and D. E. Trudell 1981 16 p refs Presented at the Ann. Meeting of the Inst. of Chem. Engr., New Orleans, 8 Nov. 1981
(Contract DE-AC04-76DP-00789)
(DE81-027804; SAND-81-0211C; CONF-811108-3) Avail: NTIS HC A02/MF A01

Dissolution of coal was shown to be affected by the amount of preasphaltenes formed which is related to the repolymerization of preasphaltenes when solvent quantity and/or quality are limited. Repolymerized preasphaltenes are shown to be reactive suggesting that a process reversibility exists for this first step of the liquefaction sequence and explaining limited solvation for early stage liquefaction. This reversibility is direct evidence that gas formation is a non-essential side reaction that is a consequence of time at temperature, not the interconversion of coal derived materials. Addition of asphaltenes, increases the amount of oil produced. This increase is accompanied by some polymerization of the asphaltenes. Process reversibility is thus observed for both the primary and secondary step of liquefaction. The effect of increases in hydrogen availability by chemical spikes and/or H-donor molecules was shown to partially compensate for the solvent deficiencies observed in the later stages of processing. M.D.K.

SMALL-SCALE FUEL-ALCOHOL PLANT. VOLUME 2: DETAILED EQUIPMENT INFORMATION Design Report
Aug. 1981 206 p
(Contract DE-AC07-76ID-01570)
(DE82-001037; DOE/TIC-2001037-Vol-2; ID-10102-Vol-2) Avail: NTIS HC A10/MF A01

Technical information about the equipment used in the Small Scale Fuel Alcohol Plant (SSFAP) is reported. Details are provided in the form of data sheets for off-the-shelf mechanical equipment and instrumentation. A specification is also included for a microprocessor. Complete drawings are included for mechanical hardware specifically designed for this plant. The information is arranged with all instrument and equipment data sheets grouped by the type of equipment. Vendor listings are provided for each type of equipment required. The design in this report represents the design after startup testing and some short periods of operation but before continuous production began. It is expected that a person or firm desiring to build a similar plant would hire a consultant or architect-engineering firm to modify this design to fit the specific application and site. DOE

FOREIGN COAL-LIQUEFACTION-TECHNOLOGY SURVEY AND ASSESSMENT
T. D. Pay and S. S. Patel Oct. 1981 341 p refs Prepared for ORNL
(Contract W-7405-eng-26)
(DE82-000555; ORNL/Sub-79/13837/6) Avail: NTIS HC A15/MF A01

The Foreign Coal Liquefaction Technology survey and Assessment is part of the International Energy Technology Assessment effort. Six countries were chosen. They are Australia, the Federal Republic of Germany (FRG), Japan, New Zealand, South Africa and the United Kingdom. These countries have active coal liquefaction programs, are using or developing technologies that could be used in the US and/or involved with US coal liquefaction programs. The resources that each has and the policies that have been adopted by their governments are presented. Although each of these countries has numerous programs underway or planned, the amount of information available on each program varies. Brief descriptions of the programs are given in the first chapter; the second chapter deals only with those liquefaction projects and gasifiers associated with direct liquefaction for which an adequate amount of reference material could be found. In the third chapter, critical areas common to all or many liquefaction systems are described. DOE

CONCEPTS OF FUNDAMENTAL PROCESSES RELATED TO GASIFICATION OF COAL Quarterly Progress Report, Jan. - Mar. 1981
W. H. Wiser Sep. 1981 3 p
(Contract DE-AM03-77SF-01484)
(DE82-000763; DOE/SF-01484/T2) Avail: NTIS HC A02/MF A01

The primary objective of the research on single stage catalytic coal gasification is to optimize the process variables and catalyst systems to maximize yields. The 200 mesh coal will be slurried in a hydrogen donor solvent, tetralin, in a ratio of 2 parts solvent to 1 part coal by weight, and initially a sulfided Ni-W/SiO_2-Al_2O_3 catalyst will be used. All of the required equipment arrived and the system has undergone pressure testing and some minor redesign. The objective of the project on single stage coal gasification to high Btu gas is to investigate the potential for obtaining high methane yields by direct catalytic hydrogenation of coal in a single stage with a maximum temperature of 5500 C. The work completed so far has included a thermodynamic feasibility study which involved investigating the effect of various parameters, temperature, pressure, and steam percent in hydrogen feed. Fifteen experimental runs have been completed. DOE

EXPERIMENTAL STUDY OF THE MULTIPLE STEADY STATES IN AN ADIABATIC COAL-LIQUEFACTION REACTOR Annual Report, 1 Sep. 1980 - 31 Aug. 1981
Y. T. Shah and P. C. Singh Sep. 1981 75 p refs
(Contract DE-FG22-80PC-30243)
(DE82-000770; DOE/PC-30243/T2) Avail: NTIS HC A04/MF A01

The purpose of the proposed study is to investigate experimentally the thermal behavior of coal liquefaction reactors. Stability of the steady state is specifically planned to be investigated in the adiabatic continuous stirred tank reactor used in the A-1 unit of the Gulf Research Center. When a reactor has more than one possible temperature for steady state operation, large temperature excursions may result from a small perturbation. An efficient control of temperature is then needed to avoid this type of run away of the reactor. In case of coal liquefaction reactors, below 4500 C no substantial reaction is observed, while above 4650 C there is every possibility of coking of the reactor. The operating range is thus very narrow and it is undesirable to have temperature excursions. A theoretical investigation of these reactors has shown multiple steady states in pilot plant operations. Industrial coal liquefaction reactors operate very close to an adiabatic mode. DOE

INVESTIGATION OF SULFUR-TOLERANT CATALYSTS FOR SELECTIVE SYNTHESIS OF HYDROCARBON LIQUIDS FROM COAL-DERIVED GASES Quarterly Technical Progress Report, 19 Mar. - 18 Jun. 1981
C. H. Bartholomew 15 Jul. 1981 32 p refs
(Contract DE-AC01-79ET-14809)
(DE82-000274; DOE/ET-14809/7-7) Avail: NTIS HC A03/MF A01

During the seventh quarter, preparation of the proposed boride-promoted catalysts was completed. An aqueous solution technique was found to improve the preparation of the supported metal boride catalysts. Characterization of 3 and 15% cobalt catalysts by O2 titration and H2 and CO chemisorptions showed dispersions to be near 7.3%. Reduction was optimum after 36 hours at 623 K. Activity/selectivity measurements showed Co/SiO_2 catalysts to be more active by an order of magnitude than corresponding Fe/SiO_2 catalysts in Fischer-Tropsch synthesis. The unsupported cobalt boride was found to be less

active, though it produced a higher molecular weight product than similar silica-supported cobalt catalysts. H2S deactivation equipment construction and calibration has been completed and preliminary tests performed. DOE

DYNAMIC BEHAVIOR OF MOVING-BED COAL-GASIFICATION REACTORS Annual Report, 1 Sep. 1980 - 31 Aug. 1981
B. Joseph Sep. 1981 82 p refs
(Contract DE-FG22-80PC-30219)
(DE82-000595; DOE/PC-30219/T1) Avail: NTIS HC A05/MF A01

A rigorous dynamic model of the two moving-bed coal gasifier was developed. The resulting coupled nonlinear partial differential equations were solved numerically using a digital computer. The model was validated through comparison with steady state pilot plant operating data and with results of existing steady state models. A number of transient studies were conducted using the dynamic mode including response to variations in coal feed rate, steam rate and oxygen feed rate. The internal solid and gas temperature profiles as well as the product gas composition were tracked as a function of time. The stability of the gasifier under various types of feedback control strategies were studied. The results are given in the form of response curves to typical input disturbances. DOE

EFFECTS OF GAS-FLOW PATTERN ON CAVITY SHAPE
John R. Creighton 22 Jul. 1981 16 p refs Presented at the 7th Ann. Underground Coal Conversion Symp., Fallen Leaf Lake, Calif., 7-11 Sep. 1981
(Contract W-7405-eng-48)
(DE82-000347; UCRL-85907; CONF-810923-10) Avail: NTIS HC A02/MF A01

The effects of different gas flow patterns on the cavity shape in laboratory scale coal block experiments are shown. The burning of pure carbon is modeled. The rate of removal of carbon from the cavity wall is shown to depend on the local rate of oxygen transport to the wall. A numerical model which assumes plug flow in the cavity with a laminar boundary layer gives cavities shaped like an exponential horn, with the largest radius next to the inlet. The downstream shape is in reasonable agreement with experiment. When cavity flow is calculated using the full Navier-Stokes equations the flow near the inlet resembles an expanding jet surrounded by a torroidal vortex. The maximum rate of oxygen transport to the wall occurs where the jet strikes the converging cavity wall some distance downstream. The reduced oxygen transport near the inlet causes the upstream portion of the cavity to be rounded. The downstream portion of the cavity is similar to that with plug flow. DOE

UNDERGROUND COAL MINING SECTION DATA Final Report
Charles P. Gabrill and Jack T. Urie 24 Sep. 1981 151 p refs Prepared for JPL
(NASA-CR-168393; JPL-9950-901) Avail: NTIS HC A08/MF A01 CSCL 08L

A set of tables which display the allocation of time for ten personnel and eight pieces of underground coal mining equipment to ten function categories is provided. Data from 125 full shift time studies contained in the KETRON database was utilized as the primary source data. The KETRON activity and delay codes were mapped onto JPL equipment, personnel and function categories. Computer processing was then performed to aggregate the shift level data and generate the matrices. Additional, documented time study data were analyzed and used to supplement the KETRON database. The source data including the number of shifts are described. Specific parameters of the mines from which there data were extracted are presented. The result of the data processing including the required JPL matrices is presented. A brief comparison with a time study analysis of continuous mining systems is presented. The procedures used for processing the source data are described. N.W.

PRELIMINARY RESOURCE ASSESSMENT OF COALBED METHANE IN THE UNITED STATES
Apr. 1981 30 p refs
(DE82-001356; DOE/METC/SP-186) Avail: NTIS HC A03/MF A01

Preliminary results of the DOE Methane Recovery from Coalbeds Project reveal that many of the coal regions in the United States have significant volumes of coalbed methane. These results show that 46 cooperative wells drilled to date have helped to update the estimates of methane in the various coal regions. The most promising coal region is in the Green River Basin where preliminary estimates show that the methane potential may be over 23 trillion cubic feet. Another area of considerable interest is in the Arkoma Basin where the methane content of coal samples ranged from 200 to 400 cubic feet per ton (cf/ton) of coal. The methane estimate in this basin is between 1.8 to 3.6 trillion cubic feet. The Piceance Creek coal region is an area presently generating considerable interest and industry activity. The methane content of the coal samples extracted from this basin averaged over 100 cf/ton. The Northern Appalachian region also shows considerable promise. DOE

(DE82-000896; DOE/MC-11580/5) Avail: NTIS

HC A11/MF A01

The mechanisms controlling porosity in Red River formation (Upper Ordovician) carbonate reservoirs, were studied in order to determine what types of pore systems result from a given set of depositional and diagenetic conditions. The Red River Formation of Montana is a major oil-producing reservoir in the area and Cabin Creek Field is a good candidate to undergo tertiary recovery in the future. The stratigraphy, distribution of lithofacies, despositional environments, and diagenesis of the study area are discussed. The various types of porosity present, their origin, how they are distributed throughout the upper Red River reservoirs, and how they relate to depositional environment are discussed. Size and shape of pores and pore throats are in terms of statistical measures from capillary-pressure curves, and by interpretation of scanning-electron micrographs of resin-pore casts. Petrophysical relationships, diagenetic controls on the development and geometry of pore systems, and the role of pore geometry in the determination of carbonate reservior characteristics are also addressed. DOE

(Grant NSF DAR-79-17712)

(PB81-243842; NSF/IST-81001) Avail: NTIS HC A03/MF A01 CSCL 08I

The effect of a stress wave pulse on a porous saturated rock was studied. Three different situations were analyzed: The presence of a linear viscoelastic (Newtonian) fluid in the pore space; the presence of a nonlinear (non-Newtonian) fluid in the pore space without a pore filled pressure gradient, i.e., fluid flow; and the presence of a nonlinear (non-Newtonian) fluid in the pore space with a pore fluid pressure gradient, i.e., fluid flow. It was found that there can be no pumping action with a periodic stress wave in a system containing a linear, Newtonian fluid for stress pulses in the low frequency range. Pumping will occur for frequencies above about 1,000 cycles per second for the material and pore spacing considered in the study typical of some rocks. GRA

INDUSTRIAL STEAM SUPPLY SYSTEM CHARACTERISTICS PROGRAM. PHASE 2: LOW- AND MEDIUM-Btu GAS-FIRED BOILERS WITH ASSOCIATED GASIFICATION PLANTS Final Report

Sep. 1981 292 p refs Prepared for ORNL

(Contract W-7405-eng-26)

(DE82-000535; ORNL/Sub-80/13847/2; FWDC-9-41-8903) Avail: NTIS HC A13/MF A01

For each system, two coal sources were considered, an Eastern high-sulfur bituminous coal and a Western low-sulfur subbituminous coal. Eight different systems were studied and conceptual cost estimates prepared for each of them. Scaling factors were developed over a range of plant sizes; cost ratios were prepared for multiple unit systems; and cost sensitivities vs degree of sulfur removal were developd for each of the on-site gasification systems. T.M.

ASSESSMENT OF EMERGING ENERGY SOURCES Summary Report

Sep. 1981 43 p refs

(DE82-900318; EPRI-EA-2023-SY) Avail: NTIS HC A03/MF A01

The results of a broad review and analysis of the commercialization potential for eight emerging sources of energy are summarized. Tight gas sands, heavy oil, methane from geopressured aquifers, oil shale, enhanced oil recovery, advanced coal mining technologies, and underground coal gasification are discussed. Each source of energy or technology was evaluated with respect to six factors affecting commercialization: size and characteristics of resource; technical and economic performance; relevant energy market growth rates; logistical considerations; development lead times; and regulatory and institutional factors. The evaluation was based on a review of existing literature, extensive interviews with industry expert, and an overall assessment of the degree to which these factors would constrain commercial development. In addition, estimates were made of supply potential from each emerging energy. DOE

DEVELOPMENT OF HYDROCONVERSION OF BIOMASS TO SYNETHETIC FUELS. PROJECT 61042 TECHNICAL REPORT Technical Progress Report, 16 May - 30 Sep. 1980

Dec. 1980 57 p refs

(Contract DE-AC02-80CS-83004)

(DE82-000874; DOE/CS-83004/1) Avail: NTIS HC A04/MF A01

The objective of this program is to develop the hydroconversion (in-situ production and addition of hydrogen to carbonaceous species) of biomass (forest and crop residues) to produce substitute natural gas. The program will also include experiments to investigate the production of hydrocarbon liquids from biomass. Progress made during the first reporting period is reported. A list of recent biomass survey and availability literature was compiled; samples of wood materials were obtained for characterization, handling, and bench-scale testing. Standard chemical and physical tests for biomass materials were identified for use in characterizing each material and its char in the program. The initial analysis and testing began with a sample of Douglas fir hog fuel. Bench-scale hydrodevolatilization and char gasification tests were performed. Experiments with maple hardwood chips are in progress. A detailed report describing the process development unit design was submitted. DOE

COGENERATION POTENTIAL: ENHANCED OIL RECOVERY Final Report

R. M. Rodden and J. L. Boyen Aug. 1981 69 p refs Sponsored by EPRI

(EPRI Proj. 1276-7)

(DE81-904202; EPRI-EM-1996) Avail: NTIS HC A04/MF A01

The purpose of this project was to perform preliminary evaluation of the potential in the United States for generating electric power in connection with producing steam for the enhanced recovery of oil. The analysis identified the size and location of the heavy oil resource base and developed estimates of oil recovery potential. Using these data, estimates were made of electric power capacity that could result if cogeneration were used to supply the necessary steam for thermal recovery. Incentives and obstacles to the use of cogeneration for thermally enhanced oil recovery are identified and discussed. The attitudes of the utilities companies and the petroleum producers toward the possible use of cogeneration for thermal oil recovery are also identified and discussed. The report presents preliminary design information on cogeneration systems that would be suitable for thermally enhanced recovery. DOE

THERMODYNAMIC DATA FOR FLUE-GAS DESULFURIZATION PROCESSES
Leo Brewer Aug. 1981 56 p refs Presented at the FGD Symp., Morgantown, W. Va., 6-7 Nov. 1980
(Contract W-7405-eng-48)
(DE81-030545; LBL-11758; CONF-801176-1) Avail: NTIS HC A04/MF A01

Thermodynamic and kinetic data for the various materials that might be used in desulfurization processes resulting from coal and oil combustion are presented. Examination of the available thermodynamic data for sulfur compounds indicates serious uncertainties and a complete review is planned to provide the best set of internally consistent values obtainable from the literature and from current experiments. Although the main emphasis will be on information needed for aqueous limestone or lime slurry treatment, the data could also be used for other processes covering a wider temperature range. Thus it is planned to provide the data, when possible, for the range from room temperature to at least 1000K. The present compilation covers most of the materials that might play a role in SO2 extraction processes and for which data were found. Supplements will be issued as data are obtained for additional substances of interest. DOE

FORMATION OF NO SUB x AND OTHER PRODUCTS FROM CHEMICALLY BOUND NITROGEN IN COAL COMBUSTION Final Report
David W. Blair and J. O. L. Wendt Jun. 1981 298 p refs
(Contract DE-AC21-77ET-11314)
(DE81-028536; DOE/ET-11314/T1) Avail: NTIS HC A13/MF A01

The purpose of this project was to advance the fundamental understanding of fuel nitrogen conversion in coal combustion towards the ultimate end of providing for the rational design of coal combustors with acceptably low NO/sub x/ outputs. In pursuit of this objective the program attacked the problem both experimentally and theoretically. Experimental work concentrated upon the pyrolysis stage of coal combustion. It investigated the loss of mass, nitrogen, and sulfur from the solid phase and the distribution of important chemical species in the pyrolyzate under simulated combustion heating conditions. Experimentally variables included temperature, heating rate, atmospheric reactivity, thermal history (preheating, reheating) and coal type. These experiments were performed upon twenty coals of widely varying types, two chars, and one petroleum coke. The results of the work suggest that the conditions of coal nitrogen conversion can be controlled by adjusting external variables. DOE

EFFECT OF THERMOMECHANICAL PROPERTIES ON INITIAL CAVITY GROWTH
R. E. Glass 1981 21 p refs Presented at the 7th Underground Coal Conversion Symp., Fallen Leaf Lake, Calif., 8 Sep. 1981
(Contract DE-AC04-76DP-00789)
(DE81-030839; SAND-81-1941C; CONF-810923-9) Avail: NTIS HC A02/MF A01

Recent field and laboratory studies in UCG have indicated that the thermomechanical properties of coals may be the controlling parameters in determining initial cavity growth. To examine this possibility laboratory and modeling efforts are being directed at determining these properties and incorporating them in a cavity growth model. The results of the work emphasize the critical role that anisotropic strengths play in determining the shape of the cavity. DOE

CORRELATION AND INTERFEROMETRIC DATA ANALYSIS APPLIED TO GAS CHROMATOGRAPHY FOURIER TRANSFORM INFRARED SPECTROSCOPY Ph.D. Thesis
Richard Claburn Wieboldt 1981 140 p
Avail: Univ. Microfilms Order No. 8125636

Gas chromatography Fourier transform infrared spectroscopy provides the chemist with the ability to separate and identify, simultaneously, mixture components. Effective analysis of data generated requires algorithms that rapidly identify portions of data which contain useful information and provide assistance in identification. The development of such algorithms and their application to the analysis of shale oil mixtures is reported. The optical design for a gas chromatograph FTIR interface is described along with its limitations. A correlation technique which allows the FTIR to be used as a specific detector for the gas chromatograph is also discussed. The use of fast Fourier transform subroutines is described in detail as part of the method for generating the synthetic interferograms. With this approach, the key absorption features for nine functional groups were determined. Dissert Abstr.

COAL-LIQUEFACTION CATALYST DEVELOPMENT Quarterly Progress Report, 1 Oct. - 30 Dec. 1980
J. A. Mahoney and J. J. Helstrom Mar. 1981 54 p
(Contract DE-AC22-79ET-14803)
(DE82-000137; DOE/ET-14803/T6; QPR-5) Avail: NTIS HC A04/MF A01

The materials initially deposited onto the catalyst were determined. A large amount of coke with an H/C ratio of 1.13 was deposited. The deposition of trace metals was also quite severe, and high levels of iron and titanium were found. At the same time there was a substantial corresponding reduction in surface area and pore volume. The sulfur is already at the usual level found in used catalysts, reflecting the condition that the major portion of the sulfur is probably combined with the sulfided cobalt and molybdenum; it would appear that only a minor part of the sulfur is combined with the coke. These results might indicate that, although a considerable amount of coke has been deposited, it is quite permeable in the early part of the experiment and becomes less permeable with time. DOE

CHEMISTRY AND CATALYSIS OF COAL LIQUEFACTION: CATALYTIC AND THERMAL UPGRADING OF COAL LIQUID AND HYDROGENATION OF CO TO PRODUCE FUELS Quarterly Progress Report, Apr. - Jun. 1981
Wendell H. Wiser Aug. 1981 56 p refs
(Contract DE-AC22-79ET-14700)
(DE82-000762; DOE/ET-14700/7) Avail: NTIS HC A04/MF A01

A technique was developed to measure active sites on a sulfided CoMo/Al2O3 catalyst by gravimetric measurements of O2 chemisorbed at -780 C in a dilute air/He stream. It was found that neither polarity nor concentration affected effective diffusivity of solutes in a porous catalyst support, which confirmed earlier results that surface diffusion is not operative in these systems, and that the dominant factor which determines diffusivity appears to be a drag coefficient. Reports of the following task groups with summaries are presented: chemical-catalytic studies; carbon-13 NMR investigation of CDL and coal; catalysis and mechanism of coal liquefaction; fundamental chemistry and mechanism of pyrolysis of bituminous coal; catalytic hydrogenation of CD liquids and related polycyclic aromatic hydrocarbons; denitrogenation and deoxygenation of CD liquids and related N- and O-compounds; and catalytic cracking of hydrogenated CD liquids. MICROSTRUCTURAL EFFECTS IN ABRASIVE WEAR Quarterly Progress Report, Dec. 1980 - 1 Jun. 1981
T. H. Kosel, M. C. Rao, H. R. Shetty, M. T. Fernandes, and N. F. Fiore 29 Oct. 1981 71 p refs
(Contract DE-AS02-77ET-10460)
(DE82-003653; DOE/ET-10460/16/17) Avail: NTIS HC A04/MF A01

This report describes research aimed at establishing quantitative relationships between microstructure and wear resistance of highly alloyed materials, including high-Cr white irons and experimental Co-base and Ni-base powder metallurgy (PM) alloys now used or potentially to be used in coal mining, handling, and gasification. The specific types of wear under study are low-stress abrasion and gouging wear encountered in mining, coal conversion, and transfer applications. During this period, work was concentrated on analysis of results. The many detailed observations obtained in the work on scratch test simulations of abrasive wear mechanisms have been summarized in drafts of three papers. The first, A Study of Abrasive Wear Mechanisms Using Diamond and Alumina Scratch Tests, is included as an appendix to this report and is being submitted for publication. Revision of the other papers is in progress. DOE

BRIQUETTING OF FINE COAL USING A SODIUM CHLORIDE BINDER Final Report
E. Y. Crossmore, Jr., R. J. Kimball, and S. M. Kimball Oct. 1981 41 p refs
(Contract DE-AC01-79ET-14303)
(DE82-000632; DOE/ET-14303/T1) Avail: NTIS HC A03/MF A01

The economic and technological feasibility of producing dense, weather resistant briquettes from fine particulate bituminous coal was demonstrated. The binder consists of a sodium chloride dendritic crystalline matrix. The proclivity for liberation of pyritic sulfur and ash from fine coal particles for precombustion Deep Cleaning was investigated, in efforts to comply with clean air standards. Process technology as to coal beneficiation produces fine sized particles and handling the material after treatment is problematic. Reconstitution of this fine particulate was studied. Briquettes were produced which are equivalent to lump natural coal. Their heat value is greater as they contain less moisture and subjective burn tests for the product show a fouling index increase range. DOE

COAL-TO-METHANOL: AN ENGINEERING EVALUATION OF TEXACO GASIFICATION AND ICI METHANOL-SYNTHESIS ROUTE Final Report
P. A. Buckingham, D. D. Cobb, A. A. Leavitt, and W. G. Snyder Aug. 1981 126 p refs
(DE81-904235; EPRI-AP-1962) Avail: NTIS HC A07/MF A01

Results of a technical and economic evaluation of producing methanol from bituminous coal using Texaco coal gasification and ICI methanol synthesis is reported. The scope of work included: development of an overall configuration for a large plant comprising coal preparation, air separation, coal gasification, shift conversion, COS hydrolysis, acid gas removal, methanol synthesis, methanol refining, and all required utility systems and off-site facilities. Design data were received from both Texaco and ICI while a design and cost estimate were received from Lotepro covering the Rectisol acid gas removal unit. The plant processes 14,448 tons per day (dry basis) of Illinois No. 6 bituminous coal and produces 10,927 tons per day of fuel-grade methanol. An overall thermal efficiency of 57.86 percent was calculated on an HHV basis and 52.64 percent based on LHV. Total plant investment at an Illinois plant site was estimated to be $1159 million dollars in terms of 1979 investment. Using EPRI's economic premises, the first-year product costs were calculated to $4.74 per million Btu (HHV) which is equivalent to $30.3 cents per gallon and $5.37 per million Btu. DOE

H-COAL PROCESS IMPROVEMENT STUDY: BENCH-UNIT BASELINE RUN WITH PREHEATER/REACTOR
May 1981 57 p
(Contract DE-AC05-77ET-10152)
(DE82-002572; DOE/ET-10152/T2) Avail: NTIS HC A04/MF A01

The thermal dissolution of coal and its effects on the mechanism of coal liquefaction in an H-Coal system were investigated. The two-state coal liquefaction system consists of a coal slurry preheater and a liquefaction reactor, a catalytic-hydrogenation-reactor. The preheater design and unit modifications are discussed. The objective of the run reported was to obtain baseline data with the preheater integrated in the bench unit system. Operating conditions and results are summarized and compared with those of previous bench runs without a preheater. The effect a preheater has on product yields and product quality was determined. Based on comparison data it is concluded that a preheater tends to increase heavy liquid yields with more residual oil and a higher proportion of heavy distillates in the distillate product. However, more experimental data at comparable operating conditions, with and without a preheater, are needed to confirm this observation. The experimental run closely simulated the conditions of another run which also included a preheater; however, product yields differed by as much as 6 w %. The higher slurry space velocities in the preheater for this run correspond to lower slurry residence times, which resulted in lower yields of lighter fractions than obtained in PDU Run 5. DOE

N82-17400# Cummins Engine Co., Inc., Columbus, Ohio.
SYNFUEL MODIFIED DIESEL Quarterly Technical Progress Report, 1 Apr. - 30 Jun. 1981
1981 16 p
(Contract DE-AC03-79ET-15450)
(DE82-002298; DOE/ET-15450/T18) Avail: NTIS HC A02/MF A01

A two-year program was proposed to test three diesel engines operating on coal-derived liquid fuels and compare the results with standard diesel fuel oil No. 2; namely: (1) prechamber diesel; (2) dual fuel diesel (direct injection); and (3) spark-assisted diesel engines. The three types of diesel engines tested were to be modified in three forms: (1) conventional water-cooled; (2) waterless-uncooled; and (3) adiabatic (uncooled). Only the conventional water-cooled prechamber diesel engine and the spark assisted prechamber diesel engine were studied. Subcontracts were let to test the prechamber diesel engine and the spark-assisted prechamber. The direct injection dual fuel engine test will be delayed until the second year of the contract. No engine modifications for waterless-uncooled and adiabatic uncooled are scheduled for the first year. The selected engine models were installed in the laboratory. Preliminary operation was made. Both subcontractors began to construct a particulate measuring system according to recommendations. DOE

REFINING AND UPGRADING OF SYNFUELS FROM COAL AND OIL SHALES BY ADVANCED CATALYTIC PROCESSES Interim Report
R. F. Sullivan, D. J. ORear, and H. A. Frumkin Sep. 1981 319 p refs
(Contracts DE-AC22-76ET-10532; EF-76-C-01-2315)
(DE82-001127; DOE/ET-10532/T3; FE-2315-61; IR-5) Avail: NTIS HC A14/MF A01

Two coal syncrudes derived from Illinois No. 6 and Wyodak coals were refined in a extensive program which included pilot plant and laboratory studies. These studies demonstrated that advanced, commercial petroleum technology can be used to refine these syncrudes to gasoline, jet, diesel and heating fuels. The coal syncrudes have a low hydrogen content, compared to petroleum, and high concentrations of oxygen and nitrogen impurities. These syncrudes are a blend of two coal distillates boiling between C sub 5 and 680 F. Consequently, they contain no residual and have about 95% boiling in the gasoline or diesel fuel ranges. With these properties, an appropriate way to refine the syncrudes is by hydroprocessing. Hydroprocessing yields a volume of finished products which is almost equivalent to the original volume of syncrude. In addition, the heteroatoms are ultimately removed as sulfur and salable ammonia. The engineering studies provided estimates of the refining costs. DOE

N82-17402# Chevron Research Co., Richmond, Calif.
REFINING AND UPGRADING OF SYNFUELS FROM COAL AND OIL SHALES BY ADVANCED CATALYTIC PROCESSES Quarterly Report, Apr. - Jun. 1981
R. F. Sullivan and D. J. ORear Sep. 1981 35 p
(Contracts DE-AC22-76ET-10532; EF-76-C-01-2315)
(DE81-030849; DOE/ET-10532/T2) Avail: NTIS HC A03/MF A01

Samples of solvent refined coal 2 middle and heavy distillates were water-washed and blended for use in a study of the potential biological hazards of synthetic crudes. A pilot plant screening was started on the blended distillate. Syncrude derived from Big Brown Texas lignite was analyzed and hydrotreated in a pilot plant. Early results show that properties and response to hydrotreating of the syncrude are similar to the results found on H-coal and solvent refined coal 2 syncrudes. DOE

PRELIMINARY INVESTIGATIONS ON THE INJECTION OF A COAL-OIL-SLURRY INTO THE BLAST FURNACE Final Report
Ulrich Rejek and Friedrich Hermann Franke Bonn Bundesministerium fuer Forschung und Technologie Dec. 1981 83 p refs Sponsored by the Bundesministerium fuer Forschung und Technologie
(BMFT-FB-T-81-221; ISSN-0340-7608) Avail: NTIS HC A05/MF A01

The flow and pumping behaviour and sedimentation of coal-oil-slurries as a function of concentration, temperature, coal and oil type, grain size, size distribution, pipe geometry etc. were determined. The results are intended to facilitate the planning of an injection plant and to enable an assessment of the economic feasibility of such a plant. The results show that for trouble-free transportation, (without undue increase in viscosity) the maximum coal concentration is 50 percent by weight with lignite coal-oil-slurries and 65 percent by weight with bituminous low volatile coal-oil-slurries at 80 C. A fine grinding of the coals leads to high viscosity in the slurries. The utilization of coarse particles leads to a rapid sedimentation at low velocities. T.M.

FIELD DEMONSTRATION OF THE CONVENTIONAL STEAM DRIVE PROCESS WITH ANCILLARY MATERIALS Annual Report, 1 Oct. 1979 - 30 Sep. 1980
Ron Bowman Oct. 1981 133 p refs
(Contract DE-FC03-79SF-10761)
(DE82-003040; DOE/SF-10761/1; AR-1) Avail: NTIS HC A07/MF A01

The applicability of foams to achieve mobility control and/or permeability reduction of injected steam in steam drive operations was tested. Foam chemicals were screened for thermal stability and the foam systems in porous media were emplaced. The compatibility of the emplacement techniques and the capacity of the chemical system to achieve a significant measure of mobility control over injected steam was verified. The two major reservoir problems in steam drive operations are addressed: the flow of steam through thief zones or other channels that exist at the outset of initiating operations, and the progressive increase in channelling of steam through the oil depleted, steam swept zone. DOE

DESIGN, FABRICATION, AND EVALUATION OF A SPIRAL-FLOW LETDOWN VALVE Final Report
H. J. Balhouse Sep. 1981 68 p refs
(DE82-900863; EPRI-AP-2044) Avail: NTIS HC A04/MF A01

A letdown valve with spiral-flow trim designed for coal liquefaction plant service was designed and tested. Letdown valves in these plants have tended to fail in a very short time due to rapid erosion of the valve trim. In the spiral-flow design, erosion is reduced by keeping velocity at a low, constant level through friction loss in a long spiraling flow path. In a field test at the

SRC-1 pilot plant, the valve controlled the processes flow for over 34 hours before it became inoperative as a result of plugging due to accumulation of solids in operational areas. It is concluded that in order to realize the potential advantages of the spiral-flow concept, more development effort is needed in the areas of prevention of plugging and the application of erosion-resistant materials and coatings. Directions for future work in these areas, plus application of the concept to a non-cavitating liquid letdown valve and other pressure reduction devices, are discussed. DOE

HELIUM PRODUCTION IN NATURAL GAS RESERVOIRS
E. B. Pereira and J. A. S. Adams (Rice Univ., Houston, Tex.) Aug. 1981 14 p refs Submitted for publication
(INPE-2214-PRE/014) Avail: NTIS HC A02/MF A01

About 11,000 published natural gas analyses of helium were used in the estimation of the average global scale accumulation and concentration of radiogenic helium in sediments. Simple lognormal statistics are employed to derive a net accumulation rate between 1000,000 to 670,000 helium atoms per cubic meter of reservoir rock per second. This accumulation rate permits an inference of an average helium concentration of non-reservoir sediments of about 67 ppm. By assuming a simple closed system model, it is shown that deep seated sources of helium are not necessary to explain the present regime of helium in sediments on a global scale, and that the accumulation rate and concentration obtained are in close agreement with existing fundamental geochemical estimates of uranium and thorium in rather average type of sediments. BASELINE STUDIES ON THE FEASIBILITY OF DETECTING A COAL/SHALE INTERFACE WITH A SELF-POWERED SENSITIZED PICK Final Report
Granville R. Anderson, II 19 Feb. 1981 98 p refs
(Contract DEN8-000011)
(NASA-CR-161960) Avail: NTIS HC A05/MF A01 CSCL 08I

The feasibility of utilizing a sensitized pick to discriminate between cutting coal and roof material during the longwall mining process was investigated. A conventional longwall mining pick was instrumented and cutting force magnitudes were determined for a variety of materials, including Illinois #6 coal, shale type materials, and synthetic coal/shale materials. THE DESIGN OF A MECHANICAL REFERENCING SYSTEM FOR THE REAR DRUM OF THE LONGWALL SHEARER COAL MINER Final Report
E. William Jones and Thomas Chen-Hsing Yang 4 Jun. 1981 78 p refs
(Contract NCA8-00131)
(NASA-CR-161962; MSSU-EIRS-ME-81-4) Avail: NTIS HC A05/MF A01 CSCL 08I

The design of two systems which reference the position of a longwall shearer coal miner to the mine roof of the present cut and of the last cut are presented. This system is part of an automation system that will guide the rear cutting drum in such a manner that the total depth of cut remains constant even though the front drum may be following an undulating roof profile. The rear drum referencing mechanism continually monitors the distance from the mine roof to the floor for the present cut. This system provides a signal to control a constant depth of cut. The last cut follower mechanism continually monitors the distance from the mine roof of the prior cut to the cutting drum. This latter system provides a signal to minimize the step height in the roof between cuts. The dynamic response of this hydraulic-pneumatic and mechanical system is analyzed to determine accumulator size and precharge pressure. B.W.

THE DETECTION OF THE COAL ROOF INTERFACE BY USE OF HIGH PRESSURE WATER Final Report
1981 55 p refs
(Grant NsG-8055)
(NASA-CR-161959) Avail: NTIS HC A04/MF A01 CSCL 08I

A device whereby water jets can be used to detect the interface between coal and the overlying roof rock is described. Once this identification is made this distance can be measured using instruments such as the autofocus systems recently developed in the photographic industry. Experiments carried out show that the device can discriminate between coal and rock at coal thicknesses up to 8 inches. An autofocus system was examined which indicates accuracies of better than 0.1 inches. B.W.

DEVELOPMENT OF SENSITIZED PICK COAL INTERFACE DETECTOR SYSTEM Final Report
R. F. Burchill [1982] 68 p
(Contract NAS8-32538)
(NASA-CR-161961) Avail: NTIS HC A04/MF A01 CSCL 08I

One approach for detection of the coal interface is measurement of pick cutting loads and shock through the use of pick strain gage load cells and accelerometers. The cutting drum of a long wall mining machine contains a number of cutting picks. In order to measure pick loads and shocks, one pick was instrumented and telemetry used to transmit the signals from the drum to an instrument-type tape recorder. A data system using FM telemetry was designed to transfer cutting bit load and shock information from the drum of a longwall shearer coal mining machine to a chassis mounted data recorder. The design of components in the test data system were finalized, the required instruments were assembled, the instrument system was evaluated in an above-ground simulation test, and an underground test series to obtain tape recorded sensor data was conducted. THE MODELLING OF SEMIFLEXIBLE CONVEYOR STRUCTURES FOR COAL-FACE STEERING INVESTIGATIONS. PART 1: SPATIALLY DISCRETE MODELS
J. B. Edwards, R. A. Wolfenden (National Coal Board), and A. M. S. R. Yazdi Apr. 1981 35 p refs Submitted for publication 2 Vol.
(RR-151-Pt-1) Avail: NTIS HC A03/MF A01

The coal-cutting machine shown is of the ranging-drum shearer type. The machine both cuts the coal from the solid face as it proceeds along the face and simultaneously loads the product onto the scraper-chain conveyor. This operation is aided by the spiral vanes around the rotating drum periphery upon which the cutting picks are mounted. The scraper-chain conveyor also has more than a single function: it not only conveys the cut product to the face-end but, because of the robust construction if its structure, it also provides a comparatively smooth track upon which the power-loader rides. Mathematical models of the steering system and the overall process are presented. Examples of predicted behavior are given. J.M.S.

A PROJECT TO TEST FOR SHALE GAS IN OHIO Final Report
30 Apr. 1981 197 p
(Contract DE-AC21-78MC-08339)
(DE82-000916; DOE/MC-12697/T3) Avail: NTIS HC A08/MF A01

Methods to find deep zones of natural fracture in the search for viable shale gas are discussed. The measurement of seismic velocity in the shale is examined. This speed is expected to be lowered by the presence of fractures, particularly if the fractures contain gas. The seismic reflection method, which times the

echoes from deep rock layers, is used to measure the speed of sound in the shale. The results of the seismic velocity analysis are summarized. Gas was obtained from two naturally fractured zones in the Chagrin shale. The well was stimulated and tested at three separate levels: the Rhinestreet shale, Huron shale, and the Chagrin. DOE

SHALE GAS IN THE SOUTHERN CENTRAL AREA OF NEW YORK STATE: PART 1. HOW TO FIND AND DEVELOP SHALE GAS IN NEW YORK STATE
Apr. 1981 71 p Sponsored in part by New York Energy Research and Development Authority
(Contract DE-AC21-79MC-12697)
(DE82-000913; DOE/MC-12697/T1) Avail: NTIS HC A04/MF A01

The economics of shale-gas exploration in New York are discussed. To date three wells have been artificially fractured in the Marcellus shale of New York, and all three appear to be producers. The chances of extracting gas are improved if geological techniques can identify zones of a suitable degree of natural fracturing in the shale. These techniques are aided by detailed structure maps of the shale units. It is concluded that the most likely source of shale gas in south central New York is the Marcellus formation. The following recommendations are made: shale gas wells should be drilled with air; the dry open hole should be logged with gamma-ray, density, temperature and noise logs; the shale should be artificially fractured using a nitrogen stimulation technique. DOE

EVALUATION OF ALTERNATIVES IN DOWNHOLE STEAM GENERATION
Sep. 1981 82 p Sponsored by DOE
(DE82-001943; DOE/TIC-2001943) Avail: NTIS HC A05/MF A01

The development of downhole steam generators for requirements of commercialization, technical, and economic goals were evaluated. It is found that: (1) the high pressure downhole steam generator has potential for commercialization in the production of heavy oil; (2) oil yield is the critical performance parameter; (3) the downhole hydrogen/oxygen has potential for production of resources which are not unproducible or uneconomical; (4) the critical performance provided in nearly 1100 pre and posttraining forms returned by the solar and 201 stream sediment samples. Statistical and areal distributions of uranium and possible uranium related variables are displayed. Pertinent geologic factors in evaluating the potential for uranium mineralization are discussed. The high uranium values occur primarily in pleistocene delta deposits and in glacial outwash and till. Groundwater in this area is geographically associated with high values of calcium, magnesium, manganese, potassium, selenium, strontium, sulfate, and total alkalinity. DOE

RESEARCH AND EVALUATION OF BIOMASS RESOURCES/CONVERSION/UTILIZATION SYSTEMS. BIOMASS ALLOCATION MODEL. VOLUME 1: TEST AND APPENDICES A & B

R. P. Stringer, Y. K. Ahn, H. T. Chen, R. W. Helm, E. T. Nelson, and K. J. Shields Aug. 1981 222 p refs 2 Vol.

(Contract DE-AC02-78ET-20611)

(DE82-000838; DOE/ET-20611/12-Vol-1; GAI-2204-Vol-1) Avail: NTIS HC A10/MF A01

A biomass allocation model was developed to show the most profitable combination of biomass feedstocks, thermochemical conversion processes, and fuel products to serve the seasonal conditions in a regional market. This optimization model provides a tool for quickly calculating which of a large number of potential biomass missions is the most profitable mission. Other components of the system serve as a convenient storage and retrieval mechanism for biomass marketing and thermochemical conversion processing data. The system can be accessed through the use of a computer terminal, or it could be adapted to a microprocessor. A User's Manual for the system is included. Biomass derived fuels included in the data base are the following: medium Btu gas, low Btu gas, substitute natural gas, ammonia, methanol, electricity, gasoline, and fuel oil. DOE

FIELD STUDIES ON USBM AND TOSCO 2 RETORTED OIL SHALES: VEGETATION, MOISTURE, SALINITY, AND RUNOFF Final Report, 1977 - 1980

M. K. Kilkelly, W. A. Berg, and H. P. Harbert, III Aug. 1981 120 p refs

(Grant EPA-R-804719)

(PB82-109810; EPA-600/7-81-139) Avail: NTIS HC A06/MF A01 CSCL 13B

The vegetative stabilization of processed oil shales and moisture and soluble salt movement within the soil/shale profile were investigated. Research plots with two types of retorted shales (TOSCO II and USBM) with leaching and soil cover treatments were established at two locations: low-elevation and high elevation. Vegetation was established by intensive management, N and P fertilization, seeding, mulching, and irrigation. After seven growing seasons, a good vegetative cover remains with few differences between treatments, with the exception of the TOSCO retorted shale, south aspect, which consistently supports less perennial vegetative cover than other treatments. With time, a shift from perennial grasses to dominance by shrubs is observed. GRA

EFFECT OF CLIMATE ON THE DEVELOPMENT OF NATURAL RESOURCES IN ASIA

B. X. Zhang *In* WMO Tech. Conf. on Climate: Asia and Western Pacific 1981 p 439-445

Avail: NTIS MF A01; print copy available at WMO, Geneva SwFr 28

Since climate is considered to be a consequence of average values in the basic meteorological elements of temperature, moisture, wind, pressure, and evaporation, these average values are used to develop a general criterion for use in planning and managing the development of natural resources. Emphasis is placed on early recognition that an abnormal climatic cycle may be developing and an accurate weather forecast to pinpoint the location and geographic extent of the disaster. The interrelationships between climate and development are addressed in the following areas: human resources, animal and range resources, agricultural resources, forest resources, fishery resources, water resources, mineral resources, and energy resources. COMPARISON OF COAL BASED SYSTEMS: MEDIUM-BTU GAS VERSUS SNG FOR INDUSTRIAL APPLICATIONS Final Report

Michael D. Peterik 1 May 1981 202 p refs
(Contract GRI-5014-310-0195)
(PB82-117383; GRI-80/0058) Avail: NTIS
HC A10/MF A01 CSCL 21D

Production and total system economics of fuel gas from coal for industrial use were analyzed. It was found that low-Btu gas offers industry certain cost advantages over higher heat content fuel gases in specific applications, but that its use will be characterized by small scale on-site systems. Intermediate Btu gas (IBG), on the other hand, offers an incentive for gas industry involvement because of potential cost reduction to industry through a regional, centralized, utility owned system. Synthetic natural gas costs, benefiting from economics of scale and plant siting, offer industry the lowest cost alternative for the majority of systems studied. Author (GRA)

HC A04/MF A01 CSCL 21D

A series of pilot scale tests were conducted to determine the effects of various parameters on the densification of refuse derived fuel. The experiments included a series of bench scale experiments involving a single die arrangement, as well as larger scale studies in which a commercial pellet mill was used. The bench scale tests (tests in which the pellets were individually formed), were conducted both to provide data needed for an analysis of the basis dynamics of pellet formation and as an aid in the interpretation of results obtained with the pellet mill. The energy required to overcome die friction was studied independently of the energy consumed in material deformation and compression. The specific effects of die length, diameter, and taper were determined. GRA

AN ECONOMIC ANALYSIS OF COAL SUPPLY IN THE OHIO RIVER BASIN ENERGY STUDY REGION

Walter P. Page Oct. 1981 83 p refs
(Grant EPA-R-805585)
(PB82-113341; EPA-600/7-81-162) Avail: NTIS
HC A05/MF A01 CSCL 21D

Using the energy and fuel demand model developed for the Ohio River Basin Energy Study (ORBES) region (all of Kentucky, most of West Virginia, substantial portions of Illinois, Indiana and Ohio and southwestern Pennsylvania), coal production levels were projected. A separate research effort allocated the tonnage to producing districts by mine and coal type. The coal supply work focused on identifying the coal supply districts that have historically served the ORBES region and estimating the resource depletion costs associated with expanded levels of coal production between 1974 and 2000. PHYSICAL AND CHEMICAL CHARACTERISTICS OF SYNTHETIC ASPHALT PRODUCED FROM LIQUEFACTION OF SEWAGE SLUDGE Final Report, Sep. 1979 - Apr. 1981

J. M. Donovan, T. R. Batter, R. K. Miller, and R. P. Lottman (Idaho Univ., Moscow) Oct. 1981 67 p refs
(Grant EPA-R-806790)

(PB82-119082; EPA-600/2-81-242) Avail: NTIS HC A04/MF A01 CSCL 13B

Direct thermochemical liquefaction of primary undigested municipal sewage sludge was carried out to produce a low molecular weight steam volatile oil, a high molecular weight synthetic asphalt, and a residual char cake. The latter product is capable of supplying the thermal energy requirements of the conversion process. The steam volatile oil has immediate value as a synthetic fuel oil. The synthetic asphalt may prove to be a useful cement for paving or for fuel or coking stock. The thermochemical liquefaction process should be capable of operating technically and in an environmentally acceptable manner in conjunction with many existing waste water treatment facilities. The overall feasibility of the process depends on the value of the oil and synthetic asphalt products as petroleum replacements, and on the costs associated with disposal of sludge. GRA

ELECTROMAGNETIC SUBSURFACE MEASUREMENTS

Arnold M. Dean, Jr. Oct. 1981 24 p

(Proj. CWIS-31350)

(AD-A108192; CRREL-SR-81-23) Avail: NTIS HC A02/MF A01 CSCL 17/9

In 1974, personnel at the U.S. Army Cold Regions Research and Engineering Laboratory (CRREL) began using an impulse radar system to profile accumulations of ice forms. The system was modified for effective use as a profiling system in a ground or airborne configuration, in certain high-noise environments. The system can penetrate fresh water and media with a high water content. Frazil and brash ice accumulations with approximately 50% water were profiled to a depth of 25 to 35 ft. As a result of the CRREL modifications, the system has found extensive and varied applications as a low-level remote sensing tool. Applications include profiling ice accumulations (including ice jams), river beds, sheet ice, permafrost, subsurface ice masses, river bank revetments through air-entrained water, snow covers, sea ice, icebergs, and peat bogs. Limited laboratory work has also shown that the impulse radar system may be able to detect oil and gas under sea ice. Selected applications and data are presented. Since it was used mainly for research, the CRREL system needs further development to make it useful to operational units. Additional development of hardware and software is recommended. GRA

LOW NO SUBx HEAVY FUEL COMBUSTOR CONCEPT PROGRAM. PHASE 1A: COAL GAS ADDENDUM Final Report, 29 Jun. - Oct. 1981

Thomas Rosfjord and Richard Sederquist Jan. 1982 43 p refs

(Contract DEN3-149; DE-AI01-77ET-13111)

(NASA-CR-165577; DOE/NASA/0149-2; GTR-3932) Avail: NTIS HC A03/MF A01 CSCL 10B

The performance and emissions from a rich-lean combustor fired on simulated coal gas fuels were investigated using a 12.7-cm diameter axially-staged burner originally designed for operation with high heating value liquid fuels. A simple, tubular fuel injector was substituted for the liquid fuel nozzle; no other combustor modifications were made. Four test fuels were studied including three chemically bound nitrogen-free gas mixtures with higher heating values of 88, 227, and 308 kj/mol (103, 258 and 349 Btu/scf), and a 227 kj/mol (258 Btu/scf) heating value doped with ammonia to produce a fuel nitrogen content of 0.5% (wt). Stable, ultra-low nitrogen oxide, smoke-free combustion was attained for the nitrogen-free fuels. Results with the doped fuel indicated that less than 5% conversion of NH3 to nitrogen oxide levels below Environmental Protection Agency limits could be achieved. In some instances, excessive CO levels were encountered. It is shown that use of a burner design employing a less fuel-rich primary zone than that found optimum for liquid fuels would yield more acceptable CO emissions. A.R.H.

CONSTRUCTION AND OPERATION OF A ONE TON PER HOUR PILOT PLANT FOR THE VEW COAL CONVERSION PROCESS Final Report, Feb. 1981

Juergen Poller Bonn Bundesministerium fuer Forschung und Technology Nov. 1981 57 p In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technology

(BMFT FB-T-81-177; ISSN-0340-7608) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 12,20

The pilot plant is based on airblown partial gasification in an entrained reactor. Results show that at temperatures of about 1450 C, 55% to 65% of the feed coal, and 70% to 80% of the sulfur can be converted into product gas. The quality of the low BTU gas is sufficient for application in the combined gas-stream turbine process. Extensive knowledge is also gained concerning gas accompanying pollutants and the behavior of different brickwork materials in the reactor environment. The acquired data allows proper dimensioning of a prototype plant. Author (ESA)

SITE INVESTIGATIONS AND SUBMARINE SOIL MECHANICS IN POLAR REGIONS

Edwin J. Chamberlain Oct. 1981 20 p refs Sponsored in part by Geological Survey

(AD-A108269; CRREL-SR-81-24) Avail: NTIS HC A02/MF A01 CSCL 08/13

Placing oil exploration and production structures offshore in the Alaskan Beaufort Sea will require careful site investigation and evaluation of submarine soil mechanics. Ice-bonded permafrost occurs widely under the Beaufort Sea floor. Its engineering properties are important to the design of offshore structures. Highly overconsolidated clays also occur widely and interfere with access to gravels for constructing artificial islands. Sites should be selected to avoid ice-rich permafrost. Laboratory tests may need to be conducted to determine the potential hazards of thaw consolidation and weakening. GRA

DEUTERIUM HYDROGEN ISOTOPE RATIOS IN ORGANIC MATTER, MINERAL OILS, AND NATURAL GASES Final Report, Mar. 1981

Martin Schoell Bonn Bundesministerium fuer Forschung und Technologie Nov. 1981 79 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie

(BMFT-FB-T-81-204; ISSN-0340-7608) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 16.80

The dependence of the D/H isotope ratio in mineral oils and natural gases on the type of oil source rock and its usefulness for oil exploration were investigated. A technique was developed capable of determining D/H ratios in organic matter with an accuracy of + or - 2 pro mille. Results show that the isotope ratio in oils are indeed transferred by the mother rocks. Exchange experiments demonstrate that this ratio is not affected by exchange with water, even on geological time scales. The deuterium concentration in the methane of thermally formed natural gases is shown to be dependent on the maturity of the source organic matter, not on the type of mather rock. Cross correlation between the C14/C13 and the D/H ratios of natural gas methanes leads to a genetic diagram characterizing the origin of these gases. A criterium was also developed for the identification of bacterial natural gases. Author (ESA)

CHEMICAL DESULPHURISATION OF COAL

Geoffrey F. Morrison Jun. 1981 72 p refs

(ICTIS-TR-15; ISBN-92-9029-066-8) Copyright. Avail: Issuing Activity

The forms of organic and pyritic sulfur in coal and the chemical reactions these may undergo are assessed. Processes for the chemical cleaning of coal are described and evaluated, including wet oxidation, chlorinolysis, hydrothermal, microwave, and chemical comminution processes. The additional sulfur removed by chemical as compared to physical cleaning processes is insufficient to justify the additional complexity and cost of preparation. More research is required into the modes of occurrence and chemistry of sulfur in coal, particularly of organic sulfur, before the efficiency of the chemical cleaning of coal can be improved. IMPEDIMENTS TO ENERGY AND MATERIALS RECOVERY FACILITIES FOR MUNICIPAL SOLID WASTE Final Report

Ernest H. Manuel, Jr. and Fritz W. Efaw Sep. 1981 229 p refs Prepared in cooperation with Franklin Associates, Prairie Village, Kans.

(Contract EPA-68-03-2761)

(PB82-102302; EPA-600/2-81-181) Avail: NTIS HC A11/MF A01 CSCL 21D

The impediments to recycling municipal solid waste were studied. The eight facilities selected for indepth analysis represented a cross section of technologies, ownership types, geographical locations, and recovered products. None of the facilities were economical in the context of providing the least cost mode of disposal, and all eight facilities experienced net operating losses. A major impediment encountered by most of the facilities was competition from lower-cost landfills. GRA

HYDROLOGICAL PROBLEMS OF SURFACE MINING

Peter A. Wood Sep. 1981 102 p refs

(ICTIS-TR-17; ISBN-92-9209-079-X) Copyright. Avail: Issuing Activity

The physical aspects of the relation between hydrology and the surface mining of coal are reviewed. Surface and ground water are considered at the planning, extraction and restoration phases of mining. Aspects covered include the collection and handling of hydrologica data; the construction of river diversions; the control of runoff, erosion and sediment; problems of ground water and dewatering; and spoil bank hydrology. Mining hydrology interrelationships must be considered in order to ensure the efficient running of a surface mining operation while adequately protecting the environment. Author (ESA)

LONGWALL GUIDANCE AND CONTROL DEVELOPMENT Final Report, 1974 - 1982

31 Jan. 1982 118 p refs

(Contract ET-75-I-01-9012)

(NASA-TM-82455) Avail: NTIS HC A06/MF A01 CSCL 08I

The longwall guidance and control (G&C) system was evaluated to determine which systems and subsystems lent themselves to automatic control in the mining of coal. The upper coal/shale interface was identified as the reference for a vertical G&C system, with two sensors (the natural backgound and the

sensitized pick) being used to locate and track this boundary. In order to insure a relatively smooth recession surface (roof and floor of the excavated seam), a last and present cut measuring instrument (acoustic sensor) was used. Potentiometers were used to measure elevations of the shearer arms. The intergration of these components comprised the vertical control system (pitch control). Yaw and roll control were incorporated into a face alignment system which was designed to keep the coal face normal to its external boundaries. Numerous tests, in the laboratory and in the field, have confirmed the feasibility of automatic horizon control, as well as determining the face alignment. S.L.

THE GEOTHERMAL PROBABILISTIC COST MODEL WITH AN APPLICATION TO A GEOTHERMAL RESERVOIR AT HEBER, CALIFORNIA

Lowell H. Orren, G. Michael Ziman, and Sue Campbell Jones 15 Dec. 1981 70 p refs

(Contracts NAS7-100; DE-AI03-79ET-37116)

(NASA-CR-168641; DOE/ET-37116/1; JPL-Pub-81-117) Avail: NTIS HC A04/MF A01 CSCL 10A

A financial accounting model that incorporates physical and institutional uncertainties was developed for geothermal projects. Among the uncertainties it can handle are well depth, flow rate, fluid temperature, and permit and construction times. The outputs of the model are cumulative probability distributions of financial measures such as capital cost, levelized cost, and profit. These outputs are well suited for use in an investment decision incorporating risk. The model has the powerful feature that conditional probability distribution can be used to account for correlations among any of the input variables. The model has been applied to a geothermal reservoir at Heber, California, for a 45-MW binary electric plant. Under the assumptions made, the reservoir appears to be economically viable. Author

FUTURE FUELS AND ENGINES FOR RAILROAD LOCOMOTIVES. VOLUME 1: SUMMARY

S. G. Liddle, B. B. Bonzo, G. P. Purohit, and J. A. Stallkamp 1 Nov. 1981 41 p

(Contracts NAS7-100; DE-AI01-78CS-55151)

(NASA-CR-168642; JPL-Pub-81-101-Vol-1) Avail: NTIS HC A03/MF A01 CSCL 13F

The potential for reducing the dependence of railroads on petroleum fuel, particularly Diesel No. 2 was investigated. Two approaches are studied: (1) to determine how the use of Diesel No. 2 can be reduced through increased efficiency and conservation, and (2) to use fuels other than Diesel No. 2 both in Diesel and other types of engines. Because synthetic hydrocarbon fuels are particularly suited to medium speed diesel engines, the first commercial application of these fuels may be by the railroad industry. B.W.

ANALYSES OF THE NORTHERN GREAT PLAINS PROVINCE LIGNITES AND SUBBITUMINOUS COALS AND THEIR ASH

S. A. Cooley Jul. 1981 139 p refs

(DE81-028366; DOE/GFETC/RI-81/2) Avail: NTIS HC A07/MF A01

A compilation of analyses of North Dakota and Montana low-rank coals (lignites and subbituminous coals) and of their ash extends the data base for these coals. Samples both from exploratory core drilling and from auger-drilling at operating mines were evaluated to obtain a wider distribution of data. Averages and standard deviations were calculated for North Dakota and Montana mines, and correlations were investigated for east-west locations depending on geographic ranges. Highest variability for both coals was in moisture and ash contents, with moisture- and ash-free analyses being relatively uniform for each. Composition of ash exhibited wide variability, especially in sodium and calcium contents. Sulfur contents were quite variable, but the average content was usually low. Within-mine variability was usually similar to that between mines. In the eastern Montana transitional area between lignite and subbituminous coals, special precautions in sampling are required to permit accurate classification from analyses. Despite care in selection of representative cores, core samples were indicated to be less uniform in analyses than auger-drilled samples obtained from the same mine. DOE

EXPLORATORY STUDY OF COAL-CONVERSION CHEMISTRY Final Report, 20 Sep. 1979 - 19 Mar. 1981

D. S. Ross, D. McMillen, W. Ogier, and Q. Nguyen 12 Aug. 1981 95 p refs

(Contract DE-AC22-79ET-14855)

(DE82-001104; DOE/ET-14855-19) Avail: NTIS HC A05/MF A01

The rates at which the strong carbon-carbon and carbon-oxygen central bonds in hydroxydiphenylmethanes and hydroxydiphenyl ethers are broken, under homogeneous conditions, in tetralin at 400°C, were examined by tautomerization to the weakly bonded keto forms followed by homolysis of the central bonds. These homogeneous decomposition mechanisms bear directly on the susceptibility of these linkages to homogeneously and heterogeneously catalyzed cleavage. Iron oxides, particularly Fe_3O_4, are effective and selective catalysts for these same cleavages. Relative catalyst effectiveness suggests that the mechanism of catalysis involves radical cation formation. The conversion of coal to benzene soluble coal products in CO/H_2O systems displays a dependence on the pH of the starting aqueous phase. The increase in conversion is paralleled by an increase in the reaction rate of the water gas shift reaction. Potassium or sodium salts of molybdate, dichromate, and permanganate were effective for coal conversion. The catalytic activity of these salts depends on the starting pH of the aqueous solution adjusted with dilute KOH or HCL solutions. It is indicated that despite the catalytic activity of metal oxyanions, the changes in conversion are large over small pH changes; plots of conversion versus initial pH are S-shaped curves similar to common titration curves. (Contract DE-AC22-79ET-14804)

(DE81-028756; DOE/ET-14804/T2) Avail: NTIS HC A04/MF A01

A research study on Catalytic Expanded Bed Hydroprocessing of coal extracts and the operation of an integrated Two-Stage Liquefaction process development unit was made. Equilibration of the recycle paste solvent was achieved. Three short contact time runs were made with equilibrium solvent. Conversions ranged from 88 to 95 percent at hydrogen consumptions of

0.41 to 2.40 percent of moisture, ash-free coal. Considerable hydrogen was transferred from the solvent to the coal. The recycle solvent contained 23 to 48 percent 8500 F+. The LC-Finin bottoms constituted about 70 percent of the recycle solvent. The deasher recovered 71 to 80.5 percent of the extract from the SCT unit. Ash concentrations of less than 0.10 percent in the recovered extract were achieved. Nitrogen concentrations in the distillate products were below 0.2 percent. Both the catalyst activity and the product quality were the highest obtained thus far in the hydrocracking of coal extracts. An overall yield structure was calculated, based on the results of this period. The distillate (C5-8500F) yield was 3.29 barrels per ton of moisture, ash-free coal at a hydrogen consumption of 4.78 percent based on MAF coal. DOE

STUDIES IN SHOCK-TUBE SPECTROSCOPY, CHEMICAL REACTION RATES AND MECHANISMS, UTILIZATION OF LOW-BTU GASES, AND GEOTHERMAL ENERGY. 1: SHOCK-TUBE SPECTROSCOPY. 2: SHOCK-TUBE STUDIES OF CHEMICAL REACTION RATES AND MECHANISMS. 3: UTILIZATION OF LOW-BTU GASES. 4: VOLCANOES AS A SOURCE OF GEOTHERMAL ENERGY Ph.D. Thesis
Jules Michael Kline 1981 180 p
Avail: Univ. Microfilms Order No. 8125440

Correlation-absorption measurements of the (0,0) band of the NO photon system at 2250 A and emission measurements of the neutrino sub 3 fundamental of N2O at 4.52 microns are described. Use of a revised Voigt parameter for the NO photon bands, it is shown, leads to an increased value of f sub 00. Measurement of an off peak spectral absorption coefficient for an isolated spectral line using a laser light source is described. The observed temperature and pressure dependence of the spectral absorption coefficient of CH2O at the HeXe laser line is accounted for. Thermal decomposition of N2O behind reflected shock waves for 1685< or = T, deg K< or = 2560 are studied. CH2O pyrolysis and oxidation by N2O behind reflected shock waves for 1200< or = T, deg K< or = 2200 are studied. Measurements of induction times and post induction conversion rates for H2-containing low Btu gas mixtures are described. Burning rates, heat-release rates, induction times, specific burning times and specific reduced burning volumes are determined for mixtures typical of in situ shale oil retorting. The potential use of volcanoes as a source of geothermal energy is described. Dissert. Abstr.

FEASIBILITY STUDY ON NEW PROCESSES FOR FUEL FROM BIOMASS Summary Report, 1 Jun. 1979 - 31 Jan. 1981
D. Z. Rogers, Donald J. Wilhelm, and David S. Ross Jan. 1981 94 p refs Prepared for Pacific Northwest Lab.
(Contract DE-AC03-79ET-23023; SRI Proj. PYU-8616)
(DE82-002834; DOE/ET-23023/T4) Avail: NTIS
HC A05/MF A01

The technical and economic feasibility of producing liquid fuels from biomass by two types of proposed processes, peroxidic conversion and catalyzed direct liquefaction in a carbon monoxide/steam system was studied. The work was divided into three tasks: peroxidic conversion; novel acid/base systems; and economic evaluations. The plant capacity and design and economic bases were chosen to facilitate comparison with the LBL and PERC process concepts previously evaluated for DOE by SRI. This evaluation was cast in the same light as SRI's recent evaluation for DOE of the Albany liquefaction program. The product still appears to be a crude, complex, viscous, and troublesome material that could not be marketed, even as a low-grade fuel, because it is too costly and not an economical chemical feedstock. Catalytic direct biomass liquefaction still appears to offer little potential for commercialization. Economically feasible direct biomass liquefaction will require significant breakthrough in catalyst technology. Implications for research aimed at improving the liquefaction data base and the understanding of possible liquefaction processes are also discussed. GRA

HC A02/MF A01

During one process of mining coal, methane is removed from the coal seam before the coal is mined. This methane is collected underground, piped to the surface, and exhausted to the atmosphere as a waste by-product of the mining process. An electrical power generation system was assembled to demonstrate utilization of this energy source. An 800 kW gas turbine generator with attendant compression and electrical equipment converted 200,000 standard cubic feet per day of methane to about 250 kWh. This electrical power was utilized by a mine surface load consisting of a 100 hp air compressor and a 300 hp mine ventilation fan. Power generated represented about 25% of the total energy used in all the mine ventilation systems or about 5% of the total underground mine electrical requirements. The main conclusions of the work performed is that low Btu gob gas in the range of 100 to 400 Btu/ft(3) can be combusted successfully in a diffusion flame system. The efficiencies that can be achieved are high and in general stability is adequate. Both the efficiency and stability range achieved were sufficient to indicate that a gas turbine could be operated with such fuels over a normal operating cycle. One problem that was noticed during earlier investigations is that because of the low energy content of the fuel, heat losses in the combustor can significantly affect performance, particularly stability. In general such combustion systems should be maintained as near adiabatic as possible and should operate with as high a wall temperature as is possible. Further research and development will be required of any scaled combustion system before it could be considered a suitable candidate for engine installation. S.L.

ROLE OF C-CO2 IN GASIFICATION OF COAL AND CHAR Quarterly Report, 1 Jan. - 31 Mar. 1981
J. T. Sears and C. Y. Wen 1981 16 p refs
(Contract DE-AC21-78ET-11338)
(DE81-027358; DOE/ET-11338/T1) Avail: NTIS
HC A02/MF A01

The high-temperature TGA has been operated with steam and CO2 for lignite and bituminous chars. Problems with temperature calibration require varification of results before further analysis. Work on attrition of coal in a pressurized, sand fluid-bed was completed. Conditions were 5-45 cm/sec at 1 to 7 atm total pressure. The rate obtained increases with fluidizing velocity and pressure. The rate constants are negligible at velocities below approx. = 30 cm/sec for particles 60 to 175 (SIGMA) in diameter. Results appear to be dependent on change in hydrodynamics with pressure. A hot-bed fluidization system was commissioned and operated. Entrainment/elutriation data for coal particles was obtained in the range 5 to 90 cm/sec at 800 to 9000C for a 12.7 cm sand bed. DOE

HC A02/MF A01

Synthetic liquid fuels, synfuels or coal-derived liquids were characterized from a combustion-environmental point of view. Two critical problems, NO/sub x/ formation and soot formation

were studied. Pyrolysis of SCRII cuts in helium resulted in increasing aromatization as the temperature was increased. This occurred with substantial losses of hydrogen, although the amount of aromatic hydrogen per molecule increased. The slight decrease in carbon content and loss of hydrogen were balanced by a relative increase in heteroatom content, presumably oxygen. This resulted in large concentrations of unsubstituted aromatics n the stable liquid products. These were presumed to be soot precursors in staged combustion. Nonbasic nitrogen, primarily pyroles, were found to increase during pyrolysis, while basic nitrogen, primarily pyridine analogs, decreased. Thus, nonbasic nitrogen compounds could be the principal precursors of NO/sub x/ during staged combustion of synthetic coal derived fuels. When substoichiometric amounts of oxygen were added to the system, aromaticity increased.

FEASIBILITY STUDY FOR THE PRODUCTION OF LOW/MEDIUM-Btu GAS FROM COAL FOR TRI-CITY REGIONAL PORT DISTRICT GRANITE CITY, ILLINOIS
Feb. 1981 313 p
(Contract DE-FG01-80RA-50137)
(DE82-002881; DOE/RA-50137/1) Avail: NTIS HC A14/MF A01

The technical specifications for, and the economic feasibility of a wide variety of coal gasification facilities to meet the needs of an industrial park are described. The gasification facility is aimed at making the industrial sites energy independent. Three cases were studied, and the results of each are presented. The cost of gas for each case was determined both at the facility, and as delivered. The projected fuel cost for coal gas in the minimum capacity plant is considerably less than the cost for fuel oil.

(Contract DE-AC22-79ET-14801)
(DE82-002562; DOE/ET-14801/15) Avail: NTIS HC A03/MF A01

The need for additional data on behavior of three phase systems in large vessels was addressed. Parameters are investigated at conditions that relate directly to the projected demonstration plant operating conditions. Air/water/sand three phase flow system in both a 5 inch diameter and a 12 inch diameter column is used in this cold flow simulation program. The type of distributor used does not seem to affect the solids distribution profiles. The amount of solids retained in the column increases linearly with decreasing slurry velocity while changes in linear gas velocity does not affect the solids distribution profiles for the conditions studied. It is indicated that withdrawing solids from the bottom of the column results in a decreased amount of solids in the column and the solids concentration profile changes accordingly. It is shown that large particles were preferentially removed by virtue of their faster settling rate. The effects of settled particles and particle/particle interaction on solids accumulation were investigated. It it indicated that the presence of large particles does not influence the accumulation or distribution of fine particles. The column enclosure was completed and tested to identify the organic liquid/liquid which is to be used in the 12 inch diameter column.

The development and testing of an acoustic Doppler flowmeter are discussed. The characteristics of this flowmeter are: (1) standoffs to isolate the transducers from the hot pipes; and (2) an electronics system with servo-controlled adjustable filters that can process a Doppler-shift signal spectrum generated by laminar flow conditions. Flowmeters are adapted to high-temperature and high-viscosity laminar flow streams found in coal liquefaction plants.

(DE82-003245; BNL-51430) Avail: NTIS HC A03/MF A01

Commercial calcium silicate bearing Portland Cement Type II (PC III) was identified as a promising regenerative sorbent for the removal of sulfur in the fluidized-bed combustion (FBC) of coal. The PC III is agglomerated in a drum pelletizer by low energy, low cost agglomeration techniques and cured to form pellets in the size range suitable for operating FBC units. The degree of regeneration is almost complete (above 95%) during cyclic use except for the first cycle. The rate of sulfation increases with the sulfation temperature. The rate of regeneration also increases with the regeneration temperature. A small 40 mm I.D. bench scale fluid bed reactor was used to determine the sulfur removal efficiency of the PC III pellet as well as the concentration of the regenerated SO2, using propane gas as a fuel and a reducing agent. The concentration of regenerated SO2 increases with the feed rate of reducing gas and it reaches as high as 24%. Bench scale testing of PC III sorbent in a coal

fired 6 in. fluidized bed combustor indicates acceptable performance. An improved process and engineering design utilizing the PC III pellets in a coal fired power plant indicates improved economy in comparison with once through limestone desulfurization. DOE

EVALUATION OF CONTINUOUS OXYDESULFURIZATION PROCESSES Final Technical Report, Sep. 1979 - Jul. 1981
J. F. Jones and D. M. Wever Jul. 1981 106 p
(Contract DE-AC01-79ET-14292)
(DE82-002127: DOE/ET-14292/T1) Avail: NTIS
HC A06/MF A01

Three processes for the oxydesulfurization of coal were evaluated in continuous processing equipment designed, built, and/or adapted for the purpose. The three processes differed primarily in the chemical additives (none, sodium carbonate, or ammonia), fed to the 20% to 40% coal/water slurries, and in the oxygen content of the feed gas stream. Temperature, pressure, residence time, flow rates, slurry concentration and stirrer speed were the other primary independent variables. The amount of organic sulfur removed, total sulfur removed and the Btu recovery were the primary dependent variables. DOE

ADVANCED RESEARCH AND TECHNOLOGY DIRECT UTILIZATION: RECOVERY OF MINERALS FROM COAL FLY ASH. FOSSIL ENERGY PROGRAM Technical Progress Report, 1 Apr. - 30 Jun. 1981
G. Burnet, J. W. Dunker, and M. J. Murtha Sep. 1981 41 p refs
(Contract W-7405-eng-82)
(DE82-003133; IS-4777) Avail: NTIS HC A03/MF A01

The purpose of this research is to develop methods to process fly ash for (1) the separation and use of an iron rich fraction; (2) the recovery of metals (primarily Al, Fe, and Ti); and (3) the use of the process residues. During this report period, research on the HiChlor process for the high temperature chlorination of fly ash included investigation of prechlorinations using Cl2CO gas mixtures to selectively remove iron and titanium, and the physical characterization of fly ash pellets. Gas diffusion coefficients, surface areas, and pore size distributions were measured for both gamma-alumina and fly ash pellets. Experiments on the high temperature sintering of limestone-fly ash mixtures include alumina extractions from sinters prepared using waste materials. High alumina recoveries were obtained for sinters prepared using cement kiln dust as the lime source, and withsmall amounts of coal refuse added as a mineralizer. Sinter feed mixtures prepared from fly ash, kiln dust, and soda ash were also tested. X-ray diffraction measurements were used to identify the soluble and insoluble compounds found in the clinkers produced. Research has been initiated on methods to agglomerate fly ash mixtures for processing. Agglomerators rather than finely divided powder mixtures will be more easily handled, transported and processed. Feed mixtures for both the lime sinter and the HiChlor processes are being studied. A balling disc unit is being used to form agglomerate spheroids. A theoretical analysis of the magnetic separation of fly ash has been completed. GRA

A PROCEDURE FOR DETERMINING THE RESOURCE UTILIZATION POTENTIAL OF COAL ASH M.S. Thesis
James F. Karasek Sep. 1981 140 p refs
(AD-A109877: AFIT-LSSR-58-81) Avail: NTIS
HC A06/MF A01 CSCL 21/2

A combination of the increased utilization of coal as an energy source and more stringent environmental regulations is creating problems for the disposal of the ash by-product from the combustion of coal. Utilization of the coal ash as an alternate resource has proven to be a partial solution to the problem. The U.S. Air Force coal conversion program will increase coal consumption and the production of coal ash; this has a potential to create a disposal problem for coal-burning bases. The purpose of this thesis was to develop a procedure to aid an engineer in determining the resource utilization potential of the coal ash at the base. The quality and quantity of the ash are the two main factors that affect the resource utilization potential of the ash. These two factors are a function of the nature of the feed coal, and the production, collection, handling, and storage systems utilized at the base. The procedure does not address the determinstion of the market potential of the ash, but rather its potential to be utilized as an alternate resource. The procedure provides a sequence of steps to follow in determining the resource utilization potential of a coal ash. Author (GRA)

MECHANISMS OF FOULING, SLAGGING, AND CORROSION BY PULVERIZED-COAL COMBUSTION Quarterly Technical Progress Report, 1 Jul. - 30 Sep. 1981
L. L. Hsu, A. R. Stetson, and A. G. Metcalfe Oct. 1981 40 p ref
(Contract DE-AC22-81PC-40272)
(DE82-001661: DOE/PC-40272/T2: SR-81-R-4930-08: QTPR-2) Avail: NTIS HC A03/MF A01

The objective of this program is to conduct a detailed and comprehensive study of the mechanisms of fouling slagging, and corrosion in pulverized coal combustion by employing well controlled model systems which simulate the coal combustion environment. In the second quarter, work focused on completing construction of the test rig. Meanwhile, the combustor and fuel nozzle were redesigned to allow for introduction of particulates and salt solution through the fuel nozzle. Fabrication of the modified combustor and fuel nozzle is complete. The completed test system will allow particles and salt droplets to flow through the combustion zone prior to impingement on the specimen tubes. Construction of specimen retort for furnace testing is complete. Plans for the next quarter are to install and calibrate the combustor rig. DOE

SOOT FORMATION IN SYNTHETIC-FUEL DROPLETS Quarterly Technical Progress Report, 1 Jul. - 30 Sep. 1981
G. England, J. Kramlich, Y. Kwan, and R. Payne 30 Nov. 1981 32 p refs
(Contract DE-AC22-80PC-30298)
(DE82-004257; DOE/PC-30298/T4; QTPR-4) Avail: NTIS HC A03/MF A01

The droplet effects on particulates, smoke, and NO sub x emissions using the variable spray momentum injector under normal excess air and staged combustion conditions was investigated. A total of four fuels were tested, including an SRC-II blend with middle and heavy distillate. Test results indicated that within the range of droplet sizes and injection velocities investigated, particulate emissions are not strongly dependent upon droplet parameters. The greatest effect was observed for relatively large droplets (500 microns) in regions of low slip velocity. The flame studies research was concentrated upon the completion of the droplet experiments. Microexplosions of individual droplets, oil-coke cenosphere formation for residual fuel oil, and violet secondary atomization of droplets blended from heptane and heavy synthetic fuel oil were observed. At fuel rich conditions, droplet soot was correlated with carbon/hydrogen ratio for a number of fuels. The coupling between the thermal and chemical processes within the soot formation region, the morphology of the soot, and visualization of individual droplet combustion were also studied. DOE

ROLE OF THE HYDROGEN DONOR SOLVENT IN COAL HYDROLIQUEFACTION Progress Report, 1 Dec. 1980 - 28 Feb. 1982
R. R. Beishline 15 Oct. 1981 15 p refs
(Contract DE-AC02-79ER-10510)
(DE82-002716; DOE/ER-10510/T3) Avail: NTIS HC A02/MF A01

A free radical mechanism has been written for the thermolysis of the donor solvent intermediate 1,2-dihydronaphthalene (1,2-DHN). The initiation step (E/sub a/ about 38 kcal/mole) is a disproportionation between two molecules of 1,2-DHN to produce hydronaphthyl and tetralyl radicals. These radicals attack 1,2-DHN to produce dimers, or form naphthalene, tetralin and H., principally by disproportionation. The previously unknown structures of the dimers have been determined and are consistent with the proposed mechanism. The mechanism is also consistent with the experimentally measured kinetics, i.e., disappearance of 1,2-DHN by concurrent first and second order reactions. The observed first and second order rate constants are complex composites of the rate constants for the individual steps in the mechanism. Semiquantitative measurements show that molecular hydrogen is about 10% of the reaction product at 4500 C. When polycyclic aromatic hydrocarbons (PAH) are heated with 1,2-DHN, the amount of hydrogen evolved is approximately inversely proportional to the resonance energy of the PAH, i.e., the H addition: abstraction ratio increases with increasing stability of the potential hydroaromatic radical. A quantitative procedure for measuring hydrogen is being developed for future use in determining relative rates of H addition vs abstraction. DOE

THE EFFECT OF FUEL COMPOSITION ON GROUNDFALL FROM AIRCRAFT FUEL JETTISONING Final Report, Mar. 1980 - Feb. 1981
Harvey J. Clewell, III Mar. 1981 35 p refs
(AF Proj. 1900)
(AD-A110305; AFESC/ESL-TR-81-13) Avail: NTIS HC A03/MF A01 CSCL 01/3

A computer model which simulates the evaporation and free-fall of fuel droplets in the atmosphere was used to determine the effect of fuel composition on the nature and extent of ground contamination by fuel discharged from an aircraft in flight. Three fuel compositions were used: (1) JP-4, the standard Air Force jet fuel; (2) Jet A (JP-8), the standard U.S. commercial jet fuel; and (3) Number 2 Diesel Fuel, representing the upper limit for future, broadened-specification fuels from alternative sources. The results of this study indicate that the amount of liquid fuel reaching the ground from the jettisoning of commercial jet fuels is much greater than for JP-4. Moreover, future broadened specification fuels may produce even greater ground contamination when jettisoned. GRA

(Contracts DAAK70-79-C-0175; DE-AI01-79CS-50030)
(AD-A110021; AFLRL-150) Avail: NTIS HC A06/MF A01 CSCL 21/7

An investigation of the effects of alcohol fuels on spark ignition engine wear and deposition was jointly sponsored by the U.S. Department of Energy and the U.S. Army Mobility Equipment Research and Development Command. Tests were conducted using neat methanol, anhydrous ethanol, and alcohol blends as fuel in a 2.3 liter engine using a modified ASTM Sequence V-D test procedure. This dynamometer testing indicates that alcohol fuels reduce the buildup of engine deposits. Also, it was found that neat methanol greatly increases engine wear rates at operating temperatures below 75 C, while anhydrous ethanol and alcohol-gasoline blends do not increase wear rates over that of unleaded gasoline. Tests were then conducted to evaluate the effects of methanol fuel on ten fully formulated lubricants and one lubricant with twelve additive composition changes. A 20 hour steady-state test was developed which shows that engine wear is inversely related to engine oil temperature when using methanol as fuel. The study shows that one lubricant appears to best control methanol-related engine wear, but still not to acceptable levels. GRA

HC A12/MF A01

A 50 mm anhydrous alcohol plant is described. The plant uses barley grown in the region as the raw material to produce a motor fuel grade alcohol through a fermentation and distillation process. North Dakota lignite coal is used as the primary energy sources to produce alcohol from the barley. The site is located on an active branch of the Burlington Northern Railroad, providing efficient and economical access to North Dakota's vast lignite coal fields in western North Dakota and to the established grain and grain by-product markets of Duluth and Minneapolis. The site is also adjacent to paved secondary highways, providing access to state and interstate highway systems. The plant site is adjacent to the City of Walhalla and will be annexed to the city limits and served by community facilities. Electrical energy to operate plant equipment is partially produced by co-generation within the plant but the total electrical energy cannot be produced internally. A technical review of the plant is provided. The process, plant layout, and major equipment procurement and costs are described. A complete economic analysis is provided using the data derived from the technical evaluation and cost estimates. Siting and the environmental and socio-economic considerations are covered. A review of the proposed management and personnel structure is included. DOE

SMALL-SCALE FUEL-ALCOHOL PLANT. VOLUME 1: DESIGN REPORT
Aug. 1981 227 p
(Contract DE-AC07-76ID-01570)
(DE82-001038; DOE/TIC-2001038-Vol-1) Avail: NTIS
HC A11/MF A01

A small-scale fuel alcohol plant designed and constructed for the DOE by EG and G Idaho, Inc., an operating contractor at the Idaho National Engineering Laboratory, is described. The plant is reasonably complete, having the capability for feedstock preparation, cooking, saccharification, fermentation, distillation, by-product dewatering, and process steam generation. An interesting feature is an instrumentation and control system designed to allow the plant to run 24 hours per day with only four hours of operator attention. The production designed capacity of the plant is 26.4 gallons of 190-proof ethanol per hour. Most of the processes and equipment used in the plant represent conventional ethanol production technology. Two slight deviations are the control system, which is common in larger plants, and the continuous cooker, which was adapted from the food industry. A device for dewatering the by-product is included, but a by-product drying system was not, because systems evaluated were too expensive for a plant of this size. DOE

COAL-GASIFICATION STUDY FOR BETHLEHEM STEEL CORPORATION'S SPARROWS POINT FACILITY
Aug. 1981 29 p
(Contract DE-FG01-79RA-20218)
(DE82-002570; DOE/RA-20218/1) Avail: NTIS
HC A03/MF A01

Although processes for producing environmentally acceptable gas from coal are available commercially, the lack of commercial operating experience in the United States requires that the pioneer users principally rely on engineering and economic analysis. The uncertainty of costs, operating reliability and retrofit impacts as well as many other factors are all considerations which must be weighed seriously when considering the use of low/or medium-Btu coal gas as an alternative fuel option. Financial analysis of the coal gasification project for Sparrows Point was done. The packback period ranged from 6.9 to 15.7 years for air-blown gasification. Oxygen-blown gasification was not at all attractive. It showed a 20.7 year payback at the most favorable end of the range. Two factors affect whether a steel plant will install coal gasification - availability of purchased fuels and economics. There is little incentive to make large capital expenditures when plentiful quantities of purchased fuels are available. Based on economics, coal gasification cannot be justified. DOE

ALCOHOL FUELS PRODUCTION, MANPOWER, AND EDUCATION: WHERE DO TWO-YEAR COLLEGES FIT
1981 37 p refs
(Contract DE-FG05-79IR-10295)
(DE82-001929; DOE/IR-10295/T1) Avail: NTIS
HC A03/MF A01

Representatives from 2-year colleges met with officials from national organizations to discuss the role of community colleges in the training of personnel and the development of curriculum to enhance the growing alcohol fuels industry. Major conclusions include: (1) Energy issues are too important for colleges to ignore in their program offerings; each college should determine what energy focuses and what program forms make most sense for its local area; (2) Community-size alcohol plants have the potential of leading the way toward local economic development and self sufficiency; (3) Production and manpower projections vary widely from one source to another. Even if the most optimistic production levels are reached, the evidence shows that three will be only a modest need for narrowly-trained alchol fuels technicians. The most reasonable approach for colleges is to train energy generalists through curricula that focus on basic competencies in science, math, management, and communications. DOE

RESEARCH ON SOLVENT-REFINED COAL Quarterly Technical Progress Report, 1 Apr. - 30 Jun. 1981
Oct. 1981 139 p refs
(Contract DE-AC22-81PC-40005)
(DE82-002530; DOE/PC-40005/5) Avail: NTIS
HC A07/MF A01

Research progress on Solvent Refined Coal is reported. Alexander Mine coal was evaluated as a feedstock for major liquefaction facilities and had a yield structure similar to other reactive Pittsburgh seam coals at standard SRC II conditions. Two lots of coal from the Ireland Mine (Pittsburgh seam) were found to be of nearly the same composition and produced essentially the same yields. Two experiments in which coal-derived nonvolatile organic matter was processed without fresh coal feed indicated constant rates of conversion of SRC to oil and gas. Insoluble organic matter remained unconverted. The naphtha and middle distillate products from the deep conversion contained less sulfur but more nitrogen than those from conventional SRC II processing. Encouraging results were obtained when a very small amount of iron oxide dispersed on alumina was added to Kaiparowits coal which cannot be proposed at normal SRC II conditions without added catalyst. Subbituminous coals from the McKinley and Edna Mines were processed successfully with added pyrite but would not run when the added catalyst was removed. DOE

BX IN-SITU OIL-SHALE PROJECT Quarterly Technical Progress Report, 1 Jun. - 31 Aug. 1981
Paul M. Dougan 20 Sep. 1981 144 p refs
(Contract DE-FC20-78LC-10747)
(DE82-002134; DOE/LC-10747/T4) Avail: NTIS HC A07/MF A01

The superheated steam injection at the BX In Situ Oil Shale Project is reported. Injection was continuous except for a period when the injection was suspended during the drilling of core hole BX-37. During the quarter, 99,760 barrels of water as superheated steam were injected into project injection wells at an average well head temperature of 7520 F and an average wellhead pressure of 1312 PSIG. During the same period, 135,469 barrels of fluid were produced from the Project production wells for a produced to injected fluid ratio of 1.36 to 1.0. Net oil production during the quarter was 38 barrels. DOE

MEASUREMENT AND CORRELATION OF CONDITIONS FOR ENTRAPMENT AND MOBILIZATION OF RESIDUAL OIL Final Report
N. R. Morrow Sep. 1981 115 p refs
(Contract DE-AS01-78ET-12077)
(DE82-001940; EMD-2-68-3302) Avail: NTIS HC A06/MF A01

Six major tasks are discussed capillary number relationships for rock samples; residual oil saturations near the wellbore; residual oil structure; effect of gravity on residual saturation; magnitude of residual oil saturation; and effects of wettabilityon on capillary number relationships. Detailed progress reports are presented for each task. Measurements of relationships between the ratio of viscous to capillary forces and the reduction in normal waterflood residual oil for a variety of rock types indicate the relative ease with which residual oil can be immiscibly displaced by a tertiary process. In reducing the amount of trapped oil to 50% of normal residual oil saturation, recovery of continuous oil is significantly easier than mobilization of trapped oil. The relative permeabilities of the water phase at reduced residual oil saturations are found to be independent of the displacement mechanism of oil movement by which the reduced residual saturations were achieved. ELECTROCYCLONE DEVELOPMENT PROGRAM Quarterly Technical Report, May - Jul. 1981
1981 26 p
(Contract DE-AC21-80ET-17091)
(DE81-030004; DOE/ET-17091/T3; FE-7091-14) Avail: NTIS HC A03/MF A01

An electrostatically augmented cyclone high efficiency, high throughout gas cleanup device for pressurized fluidized bed application is discussed. The use of large electrocyclones, with individual lockhopters and inlet/outlet ducts, will avoid the plugging and flow imbalance problems. The electrocyclone development program addresses three critical development areas: (1) performance scaleup; (2) performance at high temperature and pressure; and (3) corona charging. The performance at high temperature and pressure will be demonstrated by actual PFB tests on an 18 in. model geometrically identical to the earlier cold flow model. Preferred electrode geometries and the effects of alkali metal salt vapor on corona current under controlled conditions are determined. The electrocyclone PFB test will confirm the design approach and corona charger performance. DOE

FAULT AND JOINT GEOMETRY AT RAFT RIVER GEOTHERMAL AREA, IDAHO
L. R. Guth, R. L. Bruhn, and S. L. Beck Jul. 1981 23 p refs
(Contract DE-AC07-79ID-12079)
(DE82-003942; DOE/ID-12079-41) Avail: NTIS HC A02/MF A01

Raft River geothermal reservoir is formed by fractures in sedimentary strata of the Miocene and Pliocene salt lake formation. The fracturing is most intense at the base of the salt lake formation, along a decollement that dips eastward at less than 50 on top of metamorphosed precambrian and lower paleozoic rocks. Core taken from less than 200 m above the decollement contains two sets of normal faults. The major set of faults dips between 500 and 700. These faults occur as conjugate pairs that are bisected by vertical extension fractures. The second set of faults dips 100 to 200 and may parallel part of the basal decollement or reflect the presence of listric normal faults in the upper plate. Surface joints form two suborthogonal sets that dip vertically. East-northeast-striking joints are most frequent on the limbs of the Jim Sage anticline, a large fold that is associated with the geothermal field. DOE

REQUIREMENTS FOR THE PROVISION OF OFFSHORE WIND DATA RELATING TO WIND ENERGY CONVERSION SYSTEMS
R. I. Harris Feb. 1980 30 p refs

(NMI-R-75) Avail: NTIS HC A03/MF A01

The requirements for environmental data relating to offshore wind energy conversion systems in the United Kingdom to provide a basis for analysis of wind climate and wind structure in offshore wind energy systems are discussed. A review of available data, a measurement program to study offshore wind structure, and an analysis of the sensitivity of the system to wind parameters are proposed. A detailed measurement program at potential sites, a study of the changes and rates of change of wind structure from land to sea, and a feasibility study of an alternative and potentially cheap operational wind energy prediction method are also included. Author (ESA)

ENERGY CONVERSION

Includes photovoltaic, thermoelectric, geothermal, ocean thermal, and wind energy conversion. Also includes nuclear reactors and magnetohydrodynamic generators.

A82-18840 † Forms of energy and their transformation (Vidy energii i ikh transformatsii). L. I. Sedov. *(Vsesoiuznyi S'ezd po Teoreticheskoi i Prikladnoi Mekhanike, Alma-Ata, Kazakh SSR, May 27, 1981.) Prikladnaia Matematika i Mekhanika*, vol. 45, Nov.-Dec. 1981, p. 963-984. 32 refs. In Russian.

An examination is presented of initial basic relationships (e.g., force laws and scalar energy laws) for pure mechanical phenomena or for small individualized volumes of matter and fields in physical processes of a general form with internal and external interactions accompanied by transformations of different forms of energy. Attention is given to the meaning of various model representations, particularly space-time models, concepts of general reference systems, global or local tetrad coordinate systems, and universal and particular physical characteristic concepts possessing the properties of covariance. The general theory of admissible postulates, for use in initial thermodynamic principles, is developed. B.J.

A82-18900 International Conference on Thermoelectric Energy Conversion, 3rd, University of Texas, Arlington, TX, March 12-14, 1980, Proceedings. Conference sponsored by the Institute of Electrical and Electronics Engineers and University of Texas. Edited by K. R. Rao. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. 225 p. Members, $22.50; nonmembers, $30.

Papers were presented on thermoelectric generators and materials, including the use of selenides, SiGe alloys, and performance prediction. Further attention was devoted to other thermoelectric devices and novel applications, with mention made of thermal and finite element analysis, high efficiency conversion, element fabrication, thermoelectric condensors for adsorption refrigeration and spacecraft heat rejection using thermoelectric materials. Thermoelectric heat pumps were examined, with consideration given to figures-of-merit for BiSb alloys, designs for maximum cool-down speed, and solid state cooling of spaceborne IR focal planes. Finally, international programs were reviewed, and involved the preparation of thermoelectric thin films, the optimization of an isotopic microgenerator design, and the optimization of eutectic thermoelectric elements. A82-19052 # Simulation and operations of large wind machines. O. Wasynczuk (Purdue University, West Lafayette, IN). In: Annual Allerton Conference on Communication, Control, and Computing, 18th, Monticello, IL, October 8-10, 1980, Proceedings. Urbana, IL, University of Illinois, 1980, p. 187-195. 10 refs. Contract No. DE-AS02-77ET-29100.

The operating characteristics of a class of large, multi-megawatt wind turbine generators is examined. Design features relevant to the dynamic and transient behavior of this particular class of wind turbine generators are described. Results from hybrid computer simulation studies are included to illustrate the dynamic behavior of this class of wind turbine generators operating in a turbulent wind environment and also the transient behavior following electrical disturbances. (Author)

A82-19054 # Integration problems with large wind energy conversion systems. R. J. Thomas and J. S. Thorp (Cornell University, Ithaca, NY). In: Annual Allerton Conference on Communication, Control, and Computing, 18th, Monticello, IL, October 8-10, 1980, Proceedings. Urbana, IL, University of Illinois, 1980, p. 206-213.

This paper is concerned with the problems associated with integrating clusters of large wind-turbine generators into a utility grid system. The use of a series-connected AC/DC/AC interface, specifically designed for intermittent sources of energy such as wind-turbine generators, is suggested as a means for circumventing the economic and technical problems associated with present thought in protection and interconnection schemes. Penetration levels as a function of worst-case stability limits, dynamic siting issues, and cluster-control problems are also addressed. (Author)

A82-19103 Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. Workshop sponsored by the British Wind Energy Association. London, Multi-Science Publishing Co., Ltd., 1980. 234 p.

After presenting status reports on the U.S. and British wind energy development programs, consideration is given to a vertical axis variable geometry wind turbine, an extended multiple streamtube theory for vertical axis wind turbines, blade shapes for horizontal axis wind turbines, a comparison of studies of wind energy conversion system economics for utility applications, and wind energy systems with battery storage and diesel back-up for isolated communities. Also covered are the storage of wind energy as a liquid fuel, the offshore siting of wind turbine generators in U.K. waters, the predictability of wind turbine output, wind data requirements for wind turbine generator design, and wake structure analysis. O.C.

A82-19104 The Rutherford six meter variable-geometry vertical axis wind turbine. G. Stacey and P. J. Musgrove (Reading, University, Reading, Berks., England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 21-29. 9 refs. Science Research Council Grant No. GR/A/7483/8.

The paper describes the six-meter, vertical axis variable-geometry wind turbine originally destined for the Cambridge Autarkic House Project but now remaining at the Rutherford Laboratory as a research machine. Predicted performance using both single- and multi-streamtube models is shown, complete with an analysis of the losses between rotor and generator output, for both the two-blade and three-blade configurations. Initial field measurements for the two-blade version are reported. Measured performance is compared both with predicted performance curves and with results from similar machines. Finally, a brief description of future work is given. (Author)

A82-19105 Double output induction generator scheme for wind energy conversion. H. R. Bolton, W. C. Lam, and L. L. Freris (Imperial College of Science and Technology, London, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 30-40. 15 refs. Research supported by the Science Research Council.

Methods for increasing the operating speed ranges for grid-connected, three phase induction generators in windpowered turbines are presented. The recovery of 'slip energy', which occurs when the wind turbine encounters winds above the rated speed, is shown to be achievable by the use of an external resistor circuit. The excess power normally shunted into the coils of the field is used to produce heat in a water storage tank or water heater, with possible applications in homes, greenhouses, and industry. A numerical model is formulated which takes into account supersynchronous generating operation, the presence of a hot water resistor bank, and the treatment of heat dissipation. Finally, safety considerations during outage and tariff rates for privately-owned windpowered generators feeding into the grid are discussed, noting favorable rates for utility buyback will encourage the use of wind turbines and help replace the burning of fuel. M.S.K.

A82-19109 **Calculation of the flow patterns and performance of wind turbines using streamline curvature methods.** D. J. Milborrow and J. F. Ainslie (Central Electricity Generating Board, Central Electricity Research Laboratories, Leatherhead, Surrey, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 73-83. 16 refs.

Streamline curvature techniques have been used to make predictions of the flow patterns in the vicinity of wind turbines and also of the variations of static pressure within the flowfield. These studies have been carried out 1) to enable measuring techniques to be improved, 2) to obtain a better insight into the behaviour of rotors at high loadings, where the existing performance theories predict reversed flow in the wake of the machine, 3) to obtain more information on the processes involved in the generation of decay of the rotor wakes, for correlation with studies related to the performance of arrays of wind turbines. The flow patterns and performance data generated have been correlated with data from other studies. It is shown that, when used in conjunction with existing aerodynamic prediction methods, streamline curvature techniques improve the accuracy of performance estimates. (Author)

A82-19110 **Blade shapes for horizontal axis wind turbines.** M. B. Anderson (Cambridge University, Cambridge, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 84-95. 6 refs. Research supported by the Science Research Council.

A method is presented for determining the optimum blade shape for a turbine operating at a constant rotational speed. Weibull functions are used to determine a weighting distribution in the optimisation procedure. A comparison is made between near-optimum and optimum blade shapes for turbines operating at both constant tip speed ratio and constant rotational speed. (Author)

A82-19111 **Wind tunnel tests on the 1/30th scale model of the 60m wind turbine generator.** M. Buckley (British Aerospace Public, Ltd., Co., Mechanical Equipment and Systems Div., Hatfield, Herts., England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 96-108.

To provide confirmation of aerodynamic data used in the design of the full-scale machine, a one-thirtieth scale model was designed and constructed for a test program in a low speed wind tunnel. Measurements were obtained of rotor forces using strain gauges on the blade roots and drive shaft, as well as overall forces on the wind tunnel balance. The design of the machine, the instrumentation system employed and the data reduction procedures are presented in this paper. (Author)

A82-19113 **A comparison of studies of WECS economics for utility applications.** R. H. Taylor and A. P. Rockingham (Central Electricity Generating Board, Planning Dept., London, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 118-126. 14 refs.

Several studies world-wide have now been completed which analyse the economic value of wind energy conversion systems (WECS) when incorporated in utility grids. This paper reviews the models which have been used and compares the main conclusions. Results of general applicability suggest that for most utilities, the largest part of the value results from fuel saving, but that capacity credit may be significant in some cases. It has been found that the value of WECS decreases with penetration and it is now generally agreed that any storage included in the system should not be dedicated to wind power but used for the benefit of the entire system. The reasons for the sometimes large quantitative differences in capacity credit and differences in total value as a function of penetration between studies are not apparent, and it is concluded that studies must be carried out for individual utilities employing appropriate wind characteristics, yearly and daily load curves and mixes of plant. (Author)

Lipman (Reading, University, Reading, Berks.; Science Research Council, Rutherford and Appleton Laboratories, Didcot, Oxon, England), E. Bossanyi, P. D. Dunn, P. J. Musgrove, G. E. Whittle (Reading, University, Reading, Berks., England), and C. Maclean (Science Research Council, Rutherford and Appleton Laboratories, Didcot, Oxon, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 151-162.

Preliminary results of studies of the operational characteristics and performance of windpowered turbine clusters are reported. The chance that short gusts above the cut-off speed may cause shutdowns lasting 10-20 min is considered as a control system problem, and it is found that steadier output can be expected from clusters rather than single machines. Wake effects are mentioned, and ongoing studies of simultaneous winds at nine separate sites are indicated. The prediction of wind energy shortfalls is discussed, noting that steadier power can be expected from diverse clusters rather than single site clusters. The interface of spinning reserve to make up the shortfalls when the wind dies down is modeled, and it is shown that wind turbines are capable of producing 30% of the annual electrical demand. The fuel cost for spinning reserve is calculated to be less than having a peaking plant. M.S.K.

A82-19121 **The predictability of wind turbine output.** E. A. Bossanyi, G. E. Whittle, P. D. Dunn, N. H. Lipman, P. J. Musgrove (Reading, University, Reading, Berks., England), and C. Maclean (Science Research Council, Rutherford and Appleton Laboratories, Didcot, Oxon, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 194-201. 5 refs.

A method of bins was used with hourly mean wind speeds to predict the output of wind turbines. Rated capacity was regarded as unity and power surpluses or deficits were calculated over 40 bins to establish error probabilities in the predictions of wind speed persistence six hours in advance. Higher rated wind speeds were found to increase the probability for correct predictions of output, while factors such as variable pitch and speed also contributed an influence. The persistence method was favorably compared with 6, 12, and 18 hr wind forecasts by a meteorological office. A final test was made employing 6 hr predictions for three widely spaced sites on the same coast, and the error probability was found to decrease with increasing numbers of sites. Further predictive tests with more than three sites at even greater spacing are indicated. M.S.K.

A82-19122 **Wind data requirements for wind turbine generator design.** U. Hassan (ERA Technology, Ltd., Leatherhead, Surrey, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 202-210. 9 refs.

The statistical methods of wind modeling for the design of tall masts, buildings, towers, and bridges are shown to be effective for the analysis of wind loads on wind turbine generators (WTG). The wind velocity profile and turbulence is defined as the instantaneous deviations from the short term mean wind speed, and is capable of reducing the fatigue life of the rotors and degrading the quality of power output. The simplified definition of turbulence is noted to be

deficient in its ability to predict the effects of sequential gusts on the rotors, or to show the changes in torque encountered by the rotor swept area. A relationship between the force spectrum and the velocity spectrum is analytically defined to obtain a response spectrum. Finally, the differences in wind speeds in the vertical wind profile are quantified. M.S.K.

A82-19123 Wake structure analysis. B. R. Clayton and P. Filby (University College, London, England). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 211-220. 19 refs. Research supported by the Science Research Council.

Two related aerodynamic problems, namely the wake interaction effect and the scale effect, need examination in order to predict the full-scale performances of wind turbines in isolation and in arrays. Wake interaction arises from the desire to minimize the surface area occupied by an array. The aerodynamic conditions for each turbine are therefore influenced by the presence of other turbines in the array. Scale effects result from the practical difficulties of satisfying dynamic similarity between full-scale and model flow conditions. Existing data related to these problems are analyzed, and a program including the construction of an experimental rig is described in order to fill the present gaps in knowledge so that full-scale predictions may become more reliable. A82-19124 Initial test results on the 5m horizontal axis wind turbine at Swansea. R. G. Herapath and M. G. Woollard (Swansea, University College, Swansea, Wales). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 223-228.

A82-19241 Real-time simulation of MHD/steam power plants by digital parallel processors. R. M. Johnson and D. A. Rudberg (Montana State University, Bozeman, MT). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 274-277. 6 refs.

Attention is given to a large FORTRAN coded program which simulates the dynamic response of the MHD/steam plant on either a SEL 32/55 or VAX 11/780 computer. The code realizes a detailed first-principle model of the plant. Quite recently, in addition to the VAX 11/780, an AD-10 has been installed for usage as a real-time simulation facility. The parallel processor AD-10 is capable of simulating the MHD/steam plant at several times real-time rates. This is desirable in order to develop rapidly a large data base of varied plant operating conditions. The combined-cycle MHD/steam plant model is discussed, taking into account a number of disadvantages. The disadvantages can be overcome with the aid of an array processor used as an adjunct to the unit processor. The conversion of some computations for real-time simulation is considered. G.R.

A82-19242 Digital simulation of an MHD power consolidation/D.C. to A.C. inverter system. K. Crisafulli, R. Johnson, and K. Marcotte (Montana State University, Bozeman, MT). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 308-311.

A82-19297 Performance characteristics of open-cycle linearly-diverging diagonal type single- and multiple-load generators. M. Yoshida and J. Umoto (Kyoto University, Kyoto, Japan). *Energy Conversion and Management*, vol. 21, no. 4, 1981, p. 289-297. 12 refs.

A quasi-two-dimensional theory for evaluating the performance of a diagonal type MHD generator is presented. An equivalent circuit theory is used to describe the distributions of electric quantities in the channel, and the distribution of gas-dynamical quantities in the core flow region are obtained by means of modified one-dimensional MHD flow equations. The electrical quantities in that region are expressed as averages of the previously derived two-dimensional electrical quantities perpendicular to the gas flow, while the electrical quantities in the boundary layer flow are calculated by using the momentum integral equation and the 1/7 power profiles for the gas temperature and velocity under the assumption of turbulent flow. The theory is applied to a diagonal type generator with a thermal output of 2 GW and the results are compared to those from quasi-one-dimensional calculations. M.S.K.

A82-19794 # Three-dimensional flow development in MHD generators at part load. E. D. Doss and R. K. Ahluwalia (Argonne National Laboratory, Argonne, IL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0324*. 13 p. 9 refs. Contract No. W-31-109-eng-38.

The three-dimensional behavior of flow in MHD generators at design and off-design loading points is investigated. Faraday as well as diagonally-connected channels with insulating or conducting sidewalls are considered. A simple argument is presented to show qualitatively the role of MHD body forces in generating axial vorticity and hence secondary flows in the cross stream. For Faraday channels with strong MHD interaction, the generated vorticity is shown to direct the secondary flow from the cathode to the anode wall along the centerline. For diagonally-connected channels near short-circuit, the generated vorticity is shown to direct the secondary flow from the anode to the cathode wall along the centerline, and vice-versa for near open-circuit conditions. Computational results for large generators are presented and the effect of channel loading on the flow characteristics are discussed. (Author)

A82-19795 # Preliminary investigation of the effect of electrical nonuniformities on frame current distribution of coal-fired MHD generator. M. Ishikawa, Y. C. L. Wu, and M. H. Scott (Tennessee, University, Tullahoma, TN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0326*. 11 p. 11 refs. Contract No. DE-AC02-79ET-10815.

The effect of electrical nonuniformities on frame currents in a diagonal conducting wall generator is examined by comparing three-dimensional calculations with experimental data. It is found that variations of frame current are much stronger at the cathode side than at the anode side; large local changes may occur in the frame currents that have little correlation with the overall performance. Frame currents flowing counter to the normal flow were predicted by the three-dimensional calculations and observed experimentally. This behavior is attributed to leakage through polarized slags. For three-electrode frame configurations, calculations show current conservation and predict the tendency as well as the magnitude of frame currents observed experimentally. V.L.

A82-19800 # Recent results on measurement of plasma conductivity using Faraday rotation of submillimeter waves. P. J. Kuzmenko and S. A. Self (Stanford University, Stanford, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0376*. 8 p. 12 refs. NSF-supported research.

This paper examines the application of Faraday rotation to the measurement of electron concentration in combustion MHD plasmas. Details on the design of a working system are given including the selection of operating wavelength. A theoretical comparison between the Faraday rotation technique and two path interferometry shows Faraday rotation in its simplest form to be somewhat less sensitive to changes in electron concentration. This deficit can be balanced against greater immunity to vibration and thermal drift. Improved techniques of measuring the rotation angle promise greater sensitivity. A preliminary experiment has verified the technique. (Author)

A82-20140 Possibilities and limitations of wind energy utilisation. J. Feustel (M.A.N. - Neve Technologie, Munich, West Germany). *International Journal of Ambient Energy*, vol. 2, Oct. 1981, p. 197-205. 10 refs.

The existing wind resource, the most favorable locations, applications, and designs of windpowered generators are reviewed, along with descriptions of current and historic wind turbines and lines of research. Coastal regions, plains, hill summits, and mountains with funneling regions are noted to have the highest annual wind averages, with energy densities exceeding the annual solar insolation at average wind speeds of 5-7.9 m/sec. Applications for utility-grade power production, for irrigation, for mechanical heat production,

and for pumped storage in water towers or reservoirs are mentioned, as well as electrical power production in remote areas and for hydrogen production by electrolysis. Power coefficients are discussed, with attention given to the German Growian 3 MW machine. It is shown that the least economically sound wind turbines, the machines with outputs below 100 kW, can vie with diesel plant economics in a good wind regime if the wind turbine operates for 15 yr. M.S.K.

A82-20170 Fusion - From science to engineering. J. Kenton. *EPRI Journal*, vol. 6, Dec. 1981, p. 63, 64, 66-68, 70. 8 refs.

The principles and state of advancement in fusion energy devices are explored, along with the transition from theoretical problems to engineering difficulties. Tokamaks are noted to be the closest to actual break-even, the point where the energy extracted from the reactor is equal to the energy necessary to initiate the process, although linear, mirror fusion machines also show promise. Attention is also given to poloidal diverter systems and the ELMO bumpy torus, which has demonstrated continuous operation for the first time. The prospects for a U.S. fusion engineering facility are uncertain in the light of current budget cuts, with most funding being concentrated on military applications. Laser inertial fusion devices are reviewed, as well as particle and ion accelerators for fuel pellet implosions. Finally, the most complex engineering problem is asserted to be the development of the reactor blanket system. M.S.K.

A82-20175 Power systems. G. Kaplan. *IEEE Spectrum*, vol. 19, Jan. 1982, p. 65-68.

Significant events in current, prototype, and experimental utility power generating systems in 1981 are reviewed. The acceleration of licensing and the renewal of plans for reprocessing of fuel for nuclear power plants are discussed, including the rise of French reactor-produced electricity to over 40% of the country's electrical output. A 4.5 MW fuel cell neared completion in New York City, while three 2.5 MW NASA-designed windpowered generators began producing power in the state of Washington. Static bar compensators, nonflammable-liquid cooled power transformers, and ZnO surge arrestors were used by utilities for the first time, and the integration of a coal gasifier-combined cycle power plant approached the planning phase. An MHD generator was run for 1000 hours and produced 50-60 kWe, while a 20 MVA superconducting generator was readied for testing. M.S.K.

A82-20283 The rebirth of MHD. M. Edelhart and A. Greenfield. *Technology*, vol. 2, Jan.-Feb. 1982, p. 79-83.

A low-temperature MHD system employing liquid metal and a low-boiling point organic vapor as its working fluids is described, and considered from the standpoints of: (1) development status; (2) thermal energy sources, with emphasis on low-temperature solar collectors and industrial process waste heat; (3) economic advantage, by comparison to Rankine-cycle and photovoltaic solar systems; and (4) operational efficiency. Figures for the net cost of power produced by the three solar systems compared, when the further conversion of MHD exhaust heat is considered, are $0.57/kWh for the photovoltaic, $0.116/kWh for the Rankine cycle, and $0.054/kWh for the low-temperature MHD. A further contrast is drawn with the typically 2500 C-working gas MHD systems being developed in the U.S. and U.S.S.R. O.C.

A82-20292 * # Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field. J. M. Smith, J. L. Morgan, and S.-Y. Wang (NASA. Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0396*. 10 p.

The effect of area ratio variation on the performance of a supersonic Hall MHD duct showed that for a given combustion pressure there exists an area ratio below which the power generating region of the duct is shock free and the power output increases linearly with the square of the magnetic field. For area ratios greater than this, a shock forms in the power generating region which moves upstream with increasing magnetic field strength resulting in a less rapid raise in the power output. The shock can be moved downstream by either increasing the combustion pressure or decreasing the exhaust pressure. The influence of these effects upon duct performance is presented in this paper. (Author)

A82-20739 * # High temperature durable catalyst development. G. C. Snow and H. Tong (Acurex Corp., Mountain View, CA). *Workshop on Catalytic Combustion, 5th, San Antonio, TX, Sept. 15, 16, 1981, Paper.* 38 p. 14 refs. Research supported by the Acurex Corp.; U.S. Environmental Protection Agency Contract No. 68-02-3122; Contract No. DEN3-83.

A program has been carried out to develop a catalytic reactor capable of operation in environments representative of those anticipated for advanced automotive gas turbine engines. A reactor consisting of a graded cell honeycomb support with a combination of noble metal and metal oxide catalyst coatings was built and successfully operated for 1000 hr. At an air preheat temperature of 740 K and a propane/air ratio of 0.028 by mass, the adiabatic flame temperature was held at about 1700 K. The graded cell monolithic reaction measured 5 cm in diameter by 10.2 cm in length and was operated at a reference velocity of 14.0 m/s at 1 atm. Measured NOx levels remained below 5 ppm, while unburned hydrocarbon concentrations registered near zero and carbon monoxide levels were nominally below 20 ppm. V.L.

A82-20743 * # Power system design optimization using Lagrange multiplier techniques. Y. Yu (Xerox Corp., El Segundo, CA) and F. C. Lee (Virginia Polytechnic Institute and State University, Blacksburg, VA). *Power Conversion International Conference, Munich, West Germany, Sept. 14, 1981, Paper.* 18 p. 8 refs. Contract No. NAS3-21051.

An optimization technique using the Lagrange Multiplier Method is proposed to facilitate design of switching power converter systems. The essence of the optimization is to identify the optimal battery voltage level and switching frequency along with the detailed converter design so that the total system weight including the battery and the packaged converter is minimized, and concurrently all specified power circuit performances are satisfied. (Author)

A82-20744 * A PWM transistor inverter for an ac electric vehicle drive. J. M. Slicker (Eaton Engineering and Research Center, Southfield, MI). *Institute of Electrical and Electronics Engineers, Annual Meeting, Philadelphia, PA, O[illegible] 5-9, 1981, Paper.* 8 p. 8 refs. Research supported by the U.S. Department of Energy; Contract No. DEN3-125.

A prototype system consisting of closely integrated motor, inverter, and transaxle has been built in order to demonstrate the feasibility of a three-phase ac transistorized inverter for electric vehicle applications. The microprocessor-controlled inverter employs monolithic power transistors to drive an oil-cooled, three-phase induction traction motor at a peak output power of 30 kW from a 144 V battery pack. Transistor safe switching requirements are discussed, and a circuit is presented for recovering trapped snubber inductor energy at transistor turn-off. V.L.

A82-20747 * # Comparative analysis of CCMHD power plants. F. N. Alyea, C. H. Marston, V. B. Mantri (General Electric Co., Energy Systems Programs Dept., Philadelphia, PA), B. G. Geisendorfer (Babcock and Wilcox Co., Fossil Power Generation Div., Barberton, OH), and H. Doss (Bechtel National, Inc., San Francisco, CA). *Symposium on the Engineering Aspects of MHD, 19th, Tullahoma, TN, June 15-17, 1981, Paper.* 8 p. Contract No. DEN3-135; No. DE-AC01-78ET-10818.

A study of Closed Cycle MHD (CCMHD) power generation systems has been conducted which emphasizes both advances in component conceptual design and overall system performance. New design data are presented for the high temperature, regenerative argon heaters (HTRH) and the heat recovery/seed recovery (HRSR) subsystem. Contamination of the argon by flue gas adsorbed in the HTRH is examined and a model for estimation of contamination effects in operating systems is developed. System performance and cost data have been developed for the standard CCMHD/steam cycle as powered by both direct fired cyclone combustors and selected coal gasifiers. In addition, a new CCMHD thermodynamic cycle has been identified. (Author)

A82-20750 * # MHD channel performance for potential early commercial MHD power plants. D. W. Swallom (Avco-Everett Research Laboratory, Inc., Everett, MA). *Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, Aug. 9-14, 1981,*

Paper, 7 p. 15 refs. Contract No. DEN3-51.

The commercial viability of full and part load early commercial MHD power plants is examined. The load conditions comprise a mass flow of 472 kg/sec in the channel, Rosebud coal, 34% by volume oxygen in the oxidizer preheated to 922 K, and a one percent by mass seeding with K. The full load condition is discussed in terms of a combined cycle plant with optimized electrical output by the MHD channel. Various electrical load parameters, pressure ratios, and magnetic field profiles are considered for a baseload MHD generator, with a finding that a decelerating flow rate yields slightly higher electrical output than a constant flow rate. Nominal and part load conditions are explored, with a reduced gas mass flow rate and an enriched oxygen content. An enthalpy extraction of 24.6% and an isentropic efficiency of 74.2% is predicted for nominal operation of a 526 MWe MHD generator, with higher efficiencies for part load operation. M.S.K.

A82-21148 Interfacing wind energy conversion equipment with utility systems. R. C. Meier and S. L. Macklis (General Electric Co., Advanced Energy Programs Dept., Philadelphia, PA). *Energy* (UK), vol. 7, Jan. 1982, p. 15-29.

Methods and problems of interfacing the output of wind energy conversion systems (WECS) with the utility grid are examined. Local gusts were determined to be the main cause of loss of output stability, with the concomitant possibility of going off-line until resynchronization is effected. The problem is less common than loss-of-load due to low- or no-wind conditions, and synchronous generators were found to avoid unacceptable voltage dips from moderate disturbances. A lumped parameter study was performed for the behavior of a wind turbine cluster, and stability of the WECS output was acceptable as long as the connection reactance between the WECS and the utility was less than 0.4/unit. WECS application in a variety of networks were modeled and no unendurable power fluctuations were seen to threaten the utility lines, provided proper control mechanisms were interposed on-line with the systems using mostly already existing utility circuit protection technology. M.S.K.

A82-21650 Heating by wind (Heizen mit Wind). F. Auer (Battelle-Institut, Frankfurt am Main, West Germany). *Brennstoff-Wärme-Kraft*, vol. 34, Jan. 1982, p. 39-42. In German.

The economical design of a wind power plant combined with a heat accumulator is discussed. A gliding-museum to be built on the Wasserkuppe in the Rhön mountain is used as an example to investigate which wind power plant and storage alternative can be considered based on meteorological basic data and the heat demand required. A system optimization regarding technical and economical points is used to study the wind power plant and to indicate the best accumulator. The maximum storage time established by an economic optimization is one to two days. In this regard no difference is made between sun energy and wind energy, and the storage size can span the day/night cycle. D.L.G.

A82-22896 # Lineup of the IM-series aircraft-derivative gas turbines. K. Takeo (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan). *IHI Engineering Review*, vol. 14, Oct. 1981, p. 36-42. 5 refs.

The development of the IM-series of aircraft derivative gas turbines is reviewed. The discussion begins with the IM1500 GL engine, having an output at turbine coupling of 11,100 kW and a thermal efficiency of 26.8%, first used as an industrial gas generator in 1968. Principal characteristics of the IM2000 and IM2500 are then discussed: the output and thermal efficiency of these two models are given as 12,800 kW and 33.5% and 19,300 kW and 35.1%, respectively. Fundamental specifications of the power turbines are described, and the flowpath design is presented. The construction and mechanical design of the engins are described, and results of creep-rupture, high temperature fatigue, and vibratory stress tests are given. Finally, the IM5000 power turbine, with an output of 38,000 kW and an efficiency of 38.4% is described. It is also shown how heat in the high-temperature exhaust gases from the turbines can be used in waste heat recovery systems to improve the total plant efficiency. J.F.

A82-23063 A review of the impact of the environment on aerogenerator materials. A. R. Mortimer (Science Research Council, Rutherford and Appleton Laboratories, Didcot, Oxon, England). *Wind Engineering*, vol. 5, no. 4, 1981, p. 207-218. 37 refs.

Factors which contribute to the unreliability of windpowered generators are examined, with specific regard to the availability of materials, durability, cost, ease of production, and ease of repair. The effects of wind loading and methods for testing salt air contaminants are discussed, along with the effect of moisture, of salt air on lubricants, of microbiological attack, of UV radiation, rain erosion, and icing. The probability of bird strikes is statistically defined, and consideration is given to electrostatic charging, lightning strikes, temperature changes, the corrosion of rubber by ozone, the effects of guano, and wet dry pollution. The visual, EM, and acoustic effects of wind turbines are explored, and production processes which may affect the integrity of the structure are outlined. Finally, failure mechanisms due to salt-air environments are detailed. M.S.K.

A82-23210 An approximate theory of a rapidly rotating windmill. O. Hellman (Turku, University, Turku, Finland). *Journal de Mécanique Appliquée*, vol. 5, no. 4, 1981, p. 429-451. 13 refs.

An approximate theory is presented for the calculation of an optimal windmill rotor based on propeller theory taking into account the effects of blade drag. An expression for the power coefficient of a wind machine is derived from considerations of the relation between the velocity field behind an ideal windmill and the energy produced by it, and the optimal velocity field behind a windmill rotor is analyzed. The problem of configuring windmill rotor blades to reproduce as closely as possible the optimal velocity distribution is then considered in terms of the Prandtl approximation of circulation around the rotor blades, and a procedure for rotor calculation is presented. The calculation of windmill rotor blade optimal parameters is illustrated for the case of the Göttingen 625 wing section. A.L.W.

A82-23652 # The economics of utilizing wind power in apple cold-storage systems. J. M. A. Tanchoco, R. A. Wysk, and W. E. Norris (Virginia Polytechnic Institute and State University, Blacksburg, VA). *ASME, Transactions, Journal of Solar Energy Engineering*, vol. 104, Feb. 1982, p. 23-27. 7 refs. Research supported by the U.S. Department of Agriculture.

A computer model for the economics of a wind turbine powered apple cold storage facility is described, based on the performance of a pilot installation. The facility consisted of an 8 kW windmill, storage batteries, a rectifier to convert the windmill ac power to dc for storage, a dc vapor compression refrigeration system, a 1000 bu apple storage building, and an ice-tank thermal storage system. The performance of the pilot plant was monitored for 2 yr, and the model was devised to include the variations of power and wind, the demand for power, and the quantity of auxiliary power required. Important features of an after-tax analysis of the wind turbine economics are outlined, with attention given to the annual cost equivalence for systems with and without a windmill and with consideration for tax write-offs. It was found that the windpowered system was not economical for a 1000 bu facility, but may be applicable in commercial sized operations. M.S.K.

A82-23653 # OTEC gas desorption studies. F. C. Chen and A. Golshani (Oak Ridge National Laboratory, Oak Ridge, TN). *ASME, Transactions, Journal of Solar Energy Engineering*, vol. 104, Feb. 1982, p. 35-40. 10 refs. Contract No. W-7405-eng-26.

Experiments on deaeration in packed columns and barometric intake systems, and with hydraulic air compression for open-cycle OTEC systems are reported. A gas desorption test loop consisting of water storage tanks, a vacuum system, a liquid recirculating system, an air supply, a column test section, and two barometric leg test sections was used to perform the tests. The aerated water was directed through columns filled with either ceramic Raschig rings or plastic pall rings, and the system vacuum pressure, which drives the deaeration process, was found to be dependent on water velocity and intake pipe height. The addition of a barometric intake pipe increased the deaeration effect 10%, and further tests were run with lengths of PVC pipe as potential means for noncondensible disposal through hydraulic air compression. Using the kinetic energy from the effluent flow to condense steam in the noncondensible stream improved the system efficiency. M.S.K.

A82-23680 Sudden loss of rotor blade from wind power

turbine - Calculation of maximax response spectra. B. Akesson and S. Sandstrom (Chalmers Tekniska Hogskola, Goteborg, Sweden). *Journal of Sound and Vibration*, vol. 80, Jan. 8, 1982, p. 81-96. 7 refs.

The maximum response of a linear one-degree-of-freedom system to a transient phase-shifted truncated sinusoidal load is studied. The system represents the nacelle, tower and foundation of a horizontal axis wind power turbine. The load is the horizontal component of the unbalanced centrifugal force from the remaining blade of the turbine rotor when one blade has suddenly broken off (close to the hub). The most dangerous angle of the running rotor at the instant of blade loss is found with respect to different combinations of viscous damping and load duration. Maximax response spectra (envelope spectra) are plotted. A detailed numerical example is given. (Author)

A82-23824 The application of dynamic cold neutron fluoroscopy for the visualisation of fuel and oil system operating characteristics in gas turbine development. P. A. E. Stewart (Rolls-Royce, Ltd., Advanced Projects Dept., Bristol, England). *Aeronautical Journal*, vol. 86, Jan. 1982, p. 23-28. 10 refs.

A82-24015 # Analysis of power takeoff in diagonal conducting wall channels. S. Kuo and E. Levi (New York, Polytechnic Institute, Farmingdale, NY). *Journal of Energy*, vol. 6, Mar.-Apr. 1982, p. 96-103. 7 refs. Contract No. ET-78-C-01-3084.

An analysis of diagonal-conducting-wall MHD channels leads to design principles for the power takeoff and good quantitative agreement with experimental data. The effect of power takeoff schemes on the output power level is investigated analytically. It is found that it is possible to design the electrical circuit of the channel with passive elements in the takeoff region, and, achieve a fairly even load current distribution under changing load conditions without loss of power output. (Author)

A82-24016 # Performance assessment and cost effectiveness of wind energy conversion systems. G. Miller, M. Hoffert, and D. Corren (New York University, New York, NY). *Journal of Energy*, vol. 6, Mar.-Apr. 1982, p. 104-108. 7 refs. Research supported by the Solar Energy Research Institute and New York State Energy Research and Development Administration.

Performance and cost characteristics of wind energy conversion systems (WECS) are assessed. Both technological and cost-effectiveness considerations are discussed for these systems with emphasis on developing appropriate economic measures for the application of electric power generation. A cost-effectiveness analysis is developed for target costs per unit frontal area for such systems showing the influence of annual mean windspeed, tower height, atmospheric boundary layer stability, capital-cost financing rates, and the cost escalation rate of the fossil fuel displaced. The latter two parameters are particularly sensitive ones in assessing both lifetime cost-effectiveness and payback time. Although allowable costs vary be several orders of magnitude, initial target costs for cost-effectiveness seem to be of the order of $50 to $400/sq m of frontal area. (Author)

A82-24018 # Arc mode molten seed electrodes for MHD power generation. S. Korenaga, H. Imai, and T. Masuda (Ministry of International Trade and Industry, Electrotechnical Laboratory, Ibaraki, Japan). *Journal of Energy*, vol. 6, Mar.-Apr. 1982, p. 119-124. 19 refs.

Experiments have been conducted in an electric furnace at atmospheric pressure with the object of investigating the seed arcing characteristics and electrical conductivities of seed materials, and ceramic consumption rates by seed arcing. Many important facts have been clarified from these experiments, namely that the arcing behaviors of molten seeds resemble closely those of mercury in a mercury rectifier, the cathode voltage drop of K2CO3 seed is close to that obtained for the copper electrode in an MHD channel, the molten seed has an electrical conductivity comparable to those of advanced ceramic electrodes, and so on. These results show that so-called 'arc mode molten seed electrodes' are highly promising for practical application. The arc mode molten seed cathodes for commercial MHD generating channels are discussed. (Author)

A82-24020 # Optimization of fuel composition in open-cycle magnetohydrodynamic power generation. C. F. Harris (Dayton, University, Dayton, OH) and A. S. Myerson (Georgia Institute of Technology, Atlanta, GA). *Journal of Energy*, vol. 6, Mar.-Apr. 1982, p. 155-157. 8 refs. Contract No. F33615-77-C-2004. AF Task 19.

To design an MHD generator in such a way as to reduce its size and weight, the fuel composition corresponding to the maximum power density must be determined. A technique making this determination possible is described. It involves a calculation of the power density resulting from the combustion of a given inlet fuel composition as a function of temperature and pressure for several electrode configurations at a magnetic field strength of 2-6 T. The chemical composition of the combustion products at the specified temperature and pressure are calculated with a computer program. These composition data are then used in calculating the electrical conductivity and Hall parameter at the specified conditions. Gas velocities are calculated at the entrance to the electrode channel employing the energy conservation equation for compressible flow, assuming no friction or heat losses. C.R.

A82-24021 # Theory and performance of a Wells turbine. S. Raghunathan (Belfast, Queen's University, Belfast, Northern Ireland), C. P. Tan, and N. A. J. Wells. *Journal of Energy*, vol. 6, Mar.-Apr. 1982, p. 157-160. 5 refs.

A simple theoretical approach to the design of the Wells turbine is described, with the theoretical prediction then compared with experimental data. In the test, the flow is measured using a calibrated orifice plate mounted at the end of the test section at a distance of 0.7 m from the rotor. The pressure tappings are located at a distance of 0.2 m upstream and downstream of the rotor. Low differential pressure transducers are used. The power output is obtained by measuring both the torque and rotational speed, with the torque being measured by an optical rotary transducer. The turbine is loaded using a dc commutator machine which also serves as a motor to run the turbine up to a required speed. It is observed within the range of experimental data that differences exist between the oscillating flow and steady flow results. It is concluded that the Wells self-rectifying air turbine is a feasible device for converting energy from oscillating wave energy devices. C.R.

A82-24239 Molten carbonate fuel cell improvements. K. F. Blurton and L. G. Marianowski (Institute of Gas Technology, Chicago, IL). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 211-225; Discussion, p. 225, 226. 6 refs. Research supported by the U.S. Department of Energy and Electric Power Research Institute.

It is noted that a molten carbonate fuel cell integrated with a coal gasification power plant is one of the most promising coal-using technologies because of its high efficiency, acceptable cost, and environmental acceptability. For the molten carbonate system to achieve these goals, however, continued development is required which must take into account the operating conditions of the application. The progress made in improving cell performance and life is surveyed, evaluating the effect of contaminants on cell performance and the design of multicell stacks and identifying alternative electrolyte compositions. Also discussed is the status of research on other major areas. C.R.

A82-24249 Al-air cells - Potential small electric generators for field use. T. Valand, O. Mollestad, and G. Nilsson (Forsvarets Forskningsinstitutt, Kjeller, Norway). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 523-533; Discussion, p. 533, 534. 11 refs.

The Al-air system is a very attractive system for use as an electric generator in the field. Besides the high energy density of the 'fuel' (theoretically 21 kW h per l Al), it is easy and safe to handle. Since it reacts in an electrochemical cell, it also easily adjusts to variations in load. In order to test the ability of the system, a 40 W mechanically rechargeable Al-air cell has been constructed. The reaction products, which in a short time will clog up the cell, are continuously removed from the electrolyte. The cell has a total efficiency of approximately 40% and has a current efficiency of

100% with respect to Al. Unfortunately, some serious problems have to be solved before the cell can be put into use. The properties of the cell, the problems, and possible solutions are discussed. (Author)

A82-24382 Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States. J. D. Segrest (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) and W. W. Cloud (Lockheed-California Co., Burbank, CA). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 51-63. 10 refs.

The system concept of high voltage dc power systems for aircraft applications is reviewed, with regard to the state-of-the-art in the hardware available. The history of dc system use is outlined, noting the continually increasing demand of higher voltage levels. Mention is also made of the inherent unsatisfactory lifetime levels of current constant speed 400 Hz power devices with respect to future aircraft. Cycloconverter and DC-Link power generating systems are subject to complex designs and display a poor power factor, wave form distortion, and EM incompatibility. Brushless dc motors are available for engine mounting, and provide 270 V dc, which offers high reliability, high efficiency, light weight, power continuity, fuel economy, and personnel safety. Existing systems and advanced systems are outlined, with operational performance and requirements, including the need to develop solid-state load controllers for over 50 amps power load. M.S.K.

A82-24564 # Frequency response analysis of ocean wave energy converter. M. Masubuchi (Osaka. University, Osaka, Japan) and R. Kawatani. *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/DSC-10.* 9 p. 13 refs. Members, $2.00; nonmembers, $4.00.

The energy conversion efficiency and dynamic behavior of a wave energy converter which absorbs power while oscillating on an incident sinusoidal wave train are analyzed. The device consists of two, differently-configured floating bodies connected by a rigid link, and its basic equations are obtained by assuming two-dimensional motions and considering the interaction between the two bodies and hydrodynamic and damping forces. Numerical solutions are obtained through the use of the Lewis form as the configuration of the floating bodies. Assuming that energy absorption is proportional to the square of the relative velocity between the oscillating body and the connecting link, it is shown that nearly 100% of incident wave energy is converted into mechanical energy over a wide frequency band. O.C.

A82-24692 Fuel cell power plants for utility applications. L. G. Eklund and L. M. Handley (United Technologies Corp., Hartford, CT). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 143-147. Contracts No. EX-76-C-01-2102; No. EC-77-C-03-1471.

The status of three fuel cell programs as prototypes for commercial fuel cell power plants for utility applications are discussed. The systems use either natural gas or distillate fuels, and are compatible with gaseous or liquid coal products. Two of the systems use phosphoric acid fuel cells as a basic building block in a proof of principle for supplying electricity and other energy requirements for buildings and industrial processes. The plants are on site, and deliver either a few kW to hundreds of kW, or a multimegawatt output for utility applications. A 40 kW unit is described which operates automatically, performs its own heat recovery, recovers water for its own use, and runs a simulated 16-unit apartment building. A 4.8 MW system located in New York city features a power conditioner to alter the dc output to three phase ac for the power grid. Finally, research on utility-size molten carbonate fuel cells offering 40-50% efficiency in converting coal to grid-quality power are described. M.S.K.

A82-24693 Phosphoric acid fuel cell plants for dispersed electric power generation. A. R. Jones (Westinghouse Electric Corp., Advanced Energy Systems Div., Pittsburgh, PA). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 148-153. 8 refs.

The operational characteristics of a phosphoric acid fuel cell are detailed, and features of a commercial prototype fuel cell are described. The fuel cell power plant comprises a fuel processor, fuel cells, and a power conditioner. Hydrogen is extracted from the fuel source, which can be coal, biomass, or wasted natural gas. Reformers are required to reduce CO impurities in the H2 gas fed to the fuel cells. It is projected that fuel cell units are commercially competitive with combustion turbines with current production technology, and can be sited close to the load because of benign environmental effects. The necessity of reliable central control of dispersed fuel cell plants is stressed as means of maintaining efficiency of use. A distributed gas cooling approach to remove rejected heat has been developed for military 1.5 kW fuel cells, and sufficient output to offset parasitic power losses in commercial plants are reviewed. M.S.K.

A82-24694 Engineering development of molten carbonate fuel cell power plants. L. J. Degan (General Electric Co., Schenectady, NY). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 154-159. Research supported by the Electric Power Research Institute and New York State Energy Research and Development Authority.

Initial system goals and modifications in the development of molten carbonate fuel cells are described. The cells are now in the technology readiness stage, with current work applied to fabricating fuel cells and stacks. Initial design goals in 1978 comprised fuel cells suitable for utilities using coal as fuel, and in smaller sizes where waste heat could be utilized for other purposes. Alterations in plans call for a wider choice of fuels, 100-1000 MW sizing for utilities, base load performance, instantaneous change of load, and both ac and dc generation for industrial applications. Sensitivity studies are concentrating on fuel cell pressure levels, excess air ratios, current densities, the anode recirculation ratio, and the steam cycle efficiency, and results of a stimulation of a combined cycle use are reported. Cost sensitivity trials have indicated a necessity to maintain a current density of at least 161.5 mA/sq cm, and sulfur-rich fuels can be used. M.S.K.

A82-24695 * An assessment of alternative fuel cell designs for residential and commercial cogeneration. R. A. Wakefield (Mathtech, Inc., Washington, DC). In: The 1980's - A forest of energy decision trees; Proceedings of the Region Six Conference, San Diego, CA, February 20-22, 1980. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 160-165. Research sponsored by the U.S. Department of Energy; Contract No. DEN3-89.

A comparative assessment of three fuel cell systems for application in different buildings and geographic locations is presented. The study was performed at the NASA Lewis Center and comprised the fuel cell design, performance in different conditions, and the economic parameters. Applications in multifamily housing, stores and hospitals were considered, with a load of 10kW-1 MW. Designs were traced through system sizing, simulation/evaluation, and reliability analysis, and a computer simulation based on a fourth-order representation of a generalized system was performed. The cells were all phosphoric acid type cells, and were found to be incompatible with gas/electric systems and more favorable economically than the gas/electric systems in hospital uses. The methodology used provided an optimized energy-use pattern and minimized back-up system turn-on. M.S.K.

A82-24968 High temperature solid electrolyte fuel cell. H. Sato (Ministry of International Trade and Industry, Electrotechnical Laboratory, Sakura, Ibaraki, Japan). *(Sun Shine Journal,* vol. 2, no. 1, 1981, p. 26-37.) *Energy Developments in Japan,* vol. 4, Oct. 1981, p. 111-128. Translation.

The components, operating mechanisms, and material for the fabrication of high temperature solid electrolyte fuel cells are described, along with features of a working prototype. The solid electrolyte fuel cell operates at temperatures from 900-1000 C, allowing some impurities in the fuel, and necessitating larger sized units for economic operation. Stabilized zirconia is employed as an

electrolyte with high ionic conductivity, and the movement of oxygen ions in relation to the lattice points is discussed. Porous electrodes composed of zirconia or nickel alloys are chosen as anodes. A tubular shaped structure for the prototype allows three layers of fuel electrode, electrolyte, and an air electrode on the outer surface of a porous substrate tube of Al, and fabrication steps of the cell are provided. An air electrode is used as the cathode, and an output of 12 W is achieved with a flat output characteristic curve, indicating a potential long life. M.S.K.

A82-25160 **New connections for new technologies.** N. Lihach. *EPRI Journal*, vol. 7, Jan.-Feb. 1982, p. 6-11, 13.

Problems and techniques and equipment for utilities to incorporate the electric output from small cogenerators, e.g. wind turbines, solar cells, and fuel cells, into grid quality power are examined. It is noted that currently available power conditioning systems are suitable only for multihundred MW power systems, and have no successful counterparts in the intermediate range. Applications of newly designed power conditioning units in fuel cells and battery installations, using state-of-the-art solid state circuitry, are reviewed. Specific mention is made of harmonics problems, including methods of phase-shaping, wave-shaping, and filtering specific harmonics. Procedures for eliminating electromagnetic impulses at the source are outlined, and the necessity for developing durable power conditioning systems, resistant to a variety of environmental hazards, are stressed, along with the requirements that remote power generation equipment reliably shut down when the utility grid cuts off power to that section due to damage. M.S.K.

A82-25523 **High-efficiency millimetre-wave InP TEOs made by liquid phase epitaxy.** K. H. Yen and J. J. Berenz (TRW Defense and Space Systems Group, Redondo Beach, CA). *Electronics Letters*, vol. 18, Feb. 18, 1982, p. 171, 172.

High-efficiency InP TEO devices have been fabricated by depositing gold-germanium contacts directly on thinned epitaxial layers using DC magnetron sputtering. The best RF performance has been obtained at 34 GHz for devices with an active layer length of 4.4 microns. The highest efficiency measured was 7.6% with 417 mW of power output at 34 GHz; the highest power output was 519 mW with 5.8% efficiency. V.L.

A82-25788 † **Hydraulic models of flow in an MHD generator channel, based on the equations of a two-dimensional boundary layer (O gidravlicheskikh modeliakh techeniia v kanale MGD-generatora, osnovannykh na uravneniiakh ploskogo pogranichnogo sloia).** V. A. Bitiurin, V. A. Zhelnin, G. A. Liubimov, and S. A. Medin. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza*, Jan.-Feb. 1982, p. 67-75. 10 refs. In Russian.

Flow in an MHD generator channel with a rectangular cross section is examined. It is assumed that the boundary layers on the walls of the channel are sufficiently thin, and that an inviscid core flow is present. It is shown that a hydraulic description of such a flow can be based on the two-dimensional turbulent boundary layer equations, which take into account the transverse inhomogeneities in the flow. Various aspects of the development of such hydraulic models are considered. B.J.

A82-25997 **Wind tunnel tests on slow-running vertical-axis wind-rotors.** S. Sivasegaram (Peradeniya, University, Peradeniya, Sri Lanka). *Indian Academy of Sciences, Proceedings (Engineering Sciences)*, vol. 4, Sept. 1981, p. 395-404. 17 refs.

This paper summarizes the results of investigations on the Savonius-type, slow-running, vertical-axis wind-rotors as well as on rotor designs on different subclasses under comparable design and test conditions. It is seen that the performance of the conventional Savonius rotor could be considerably improved upon and the best results are achieved by using two-bladed rotors with a more sophisticated sectional profile than in the conventional design. Rotors with several blades, although capable of considerably higher performance than the Savonius rotor, do not appear to be as good as those with two blades and improved sectional geometry. A82-26178 # **Power generation from the East Australian current by use of arrays of submerged Darrieus vertical axis turbines.** K. D. Thomson (Defence Research Centre, Salisbury, Australia). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 35-38. 9 refs.

A82-26216 # **Diffuser-augmented wind turbine analysis.** C. A. J. Fletcher (Sydney, University, Sydney, Australia). In: Australasian Conference on Hydraulics and Fluid Mechanics, 7th, Brisbane, Australia, August 18-22, 1980, Preprints of Papers. Barton, Australia, Institution of Engineers, 1981, p. 435-438. 9 refs. Research supported by the National Energy, Research, Development, and Demonstration Council.

The performance of diffuser-augmented wind turbines has been established by matching the forces acting on a blade element to overall momentum and energy balances. This permits the radial variation, wake rotation and Reynolds number effects on the turbine blades to be taken into account. Good agreement with experimental data is obtained for both turbines and turbine-simulating screens. Optimising the pitch setting to take account of the total drag as well as the power output indicates that a substantial drag reduction with only a small loss of power output is possible; this is relevant to jet-stream electricity generation. (Author)

A82-26614 **Design and performance of a small shrouded Cretan windwheel.** P. D. Fleming and S. D. Probert (Cranfield Institute of Technology, Cranfield, Beds., England). *Applied Energy*, vol. 10, Feb. 1982, p. 121-139. 22 refs. Research supported by the Science and Engineering Research Council.

Test data for the performance of a shrouded Cretan-type sail mill are reported. The mill was chosen because of simplicity and low-cost considerations, for applications in developing countries. The mill had 9 sails, a 0.64 m diam cycle wheel as a rotor, and was tested in rim-attached and sail-with-pole configurations. Winds shape the sails into airfoil shapes, and the addition of the shroud to augment the wind flow boosted the power coefficient to close to the Betz limit. The sail-with-pole form, comprising a loosely sheeted sail with the leading edge wrapped around the spoke and fastened to itself was found to be a practical configuration for driving a peristaltic pump. Maximum power was obtained with a higher rotor speed than the rotor speed for maximum torque. Prospective uses for the shrouded sail mill are given as irrigation and land drainage, and for boosting the thermo-syphon in a domestic solar heating circuit. M.S.K.

A82-26769 † **Increasing the dielectric strength of interelectrode inserts in an MHD generator channel by air injection (Pro pidvishchennia elektrichnoi mitsnosti mizhelektrodnoi vstavki kanalu MGD-generatora vduvom povitria).** E. T. Bazaev, N. I. Mazur, A. A. Miroshnichenko, and G. M. Schogolev (Akademiia Nauk Ukrains'koi RSR, Institut Tekhnichnoi Teplofiziki and Institut Elektrodinamiki, Kiev, Ukrainian SSR). *Akademiia Nauk Ukrains'koi RSR, Dopovidi, Seriia A - Fiziko-Matematichni ta Tekhnichni Nauki*, Feb. 1982, p. 71-73. 7 refs. In Ukrainian.

Interelectrode insulating inserts have been tested in the plasma dynamic channel of an MHD generator with and without air injection. It is found that the dielectric strength of inserts thermally protected by air injection is higher than that of inserts without air injection, with only a slight resistance drop (no more than 1% for commercial MHD channels). V.L.

A82-28024 **EURELIOS, the world's first thermo-mechanical helioelectric power plant.** J. Gretz (European Economic Community, Helioelectric Power Plant EURELIOS, Adrano, Italy). *Endeavour*, vol. 6, no. 1, 1982, p. 34-39. 8 refs.

Characteristics of the power source, design, costs and operating mechanisms and performance of the EURELIOS central receiver solar electric power plant are described. Noting that the solar input at the earth's surface is about 1 kW/sq m, 6200 sq m of float glass mirrors mounted on 182 heliostats were fabricated to focus the incoming radiation onto a receiver aperture atop a 55 m high tower. The curved mirrors permit the focus of 80% of the energy input to be deposited on a 2.2 m diam aperture which is equipped with heat exchangers imbedded in pyrex and darkened and finned to maximize absorption. Feedwater is superheated in the receiver and is transferred to a buffer tank of hot water at 19 bar and molten salt at 410 C, and then on to turbines for actual power production. The grid

serves as back-up power system. Total costs are calculated at $1600/kWe. M.S.K.

A82-28313 **Precision casting for gas turbine engines.** C. W. Foster (Rolls-Royce, Ltd., London, England). *Aircraft Engineering*, vol. 54, Feb. 1982, p. 11-14.

The paper describes the gas turbine casting process in detail. High-temperature creep resistance is the property whose desirability most advances casting and materials technology. Vacuum melting and casting, directionally solidified (DS) casting, equi-axed and single-crystal casting are major developments in the progress of this technology. The vacuum process was used in the RB211-524 engine, while the DS process was employed in more advanced engines of the RB series. Rolls-Royce has built a new demonstration furnace whose melting unit, furnace chamber, withdrawal chamber, vacuum system, casting cycle, and control system are described. The future will bring increasing use of automation, production of more cast-to-size features, single-crystal castings application and process developments that will produce complex internal cooling configurations that are impossible today. C.D.

A82-28537 # **Harnessing wind power.** J. Fagenbaum, *Mechanical Engineering*, vol. 104, Apr. 1982, p. 64-73. 18 refs.

The design goals, test results, operating mechanisms, and ultimate limits of large wind energy conversion systems (WECS) are explored. NASA is currently managing and monitoring the performance of the Mod O, Mod OA, Mod 1, and Mod 2 wind turbines, which produce from 100 kW-2.5 MWe for grid interconnection. The Mod 2 machines have a 300 ft diam rotor, begin producing at 14 mph and achieve the rated output at 20 mph. Testing has shown the necessity of incorporating partial span pitch control, a flexible shaft, yaw control, microprocessor monitored wind condition sensors, and a soft-shell tower to lower vibration hazards with WECS. Large WECS have proved to be relatively nonpolluting, although some television and radio interference is present. Institutional issues for the protection of land, of aircraft flight paths, and for utility interconnect are outlined, and large WECS development programs in Denmark, Sweden, Spain, and Germany are described. M.S.K.

VARIABLE GAIN FOR A WIND TURBINE PITCH CONTROL Final Report
Robert C. Seidel and Arthur G. Birchenough Dec. 1981 14 p refs
(Contract DE-AI01-76ET-20320)
(NASA-TM-82751; DOE/NASA/20320-34; E-1067) Avail: NTIS HC A02/MF A01 CSCL 10A

The gain variation is made in the software logic of the pitch angle controller. The gain level is changed depending upon the level of power error. The control uses low gain for low pitch activity the majority of the time. If the power exceeds ten percent offset above rated, the gain is increased to a higher gain to more effectively limit power. A variable gain control functioned well in tests on the Mod-0 wind turbine. T.M.

SUMMARY AND EVALUATION OF THE CONCEPTUAL DESIGN STUDY OF A POTENTIAL EARLY COMMERCIAL MHD POWER PLANT (CSPEC) Final Report
P. J. Staiger and P. F. Penko Jan. 1982 22 p refs
(Contract DE-AI01-77ET-10769)
(NASA-TM-82734; DOE/NASA/10769-21; E-1046) Avail: NTIS HC A02/MF A01 CSCL 10B

The conceptual design study of a potential early commercial MHD power plant (CSPEC) is described and the results are summarized. Each of two contractors did a conceptual design of an approximately 1000 MWe open-cycle MHD/steam plant with oxygen enriched combustion air preheated to an intermediate temperature in a metallic heat exchanger. The contractors were close in their overall plant efficiency estimates but differed in their capital cost and cost of electricity estimates, primarily because of differences in balance-of-plant material, contingency, and operating and maintenance cost estimates. One contractor concluded that its MHD plant design compared favorably in cost of electricity with conventional coal-fired steam plants. The other contractor is making such a comparison as part of a follow-on study. Each contractor did a preliminary investigation of part-load performance and plant availability. The results of NASA studies investigating the effect of plant size and oxidizer preheat temperature on the performance of CSPEC-type MHD plants are also described. The efficiency of a 1000 MWe plant is about three points higher than of a 200 MWe plant. Preheating to 1600 F gives an efficiency about one and one-half points higher than preheating to 800 F for all plant sizes. For each plant size and preheat temperature there is an oxidizer enrichment level and MHD generator length that gives the highest plant efficiency. B.W.

The powertrain consists of a single shaft regenerated gas turbine engine utilizing ceramic hot section components, coupled to a slit differential gearbox with an available variable stator torque converter and an available Ford intergral overdrive four-speed automatic transmission. Predicted fuel economy using gasoline fuel over the combined federal driving cycle (CFDC) is 15.3 km/1, which represents a 59% improvement over the spark-ignition-powered baseline vehicle. Using DF2 fuel, CFDC mileage estimates are 17.43 km/1. Zero to 96.6 km/hr acceleration time is 11.9 seconds with a four-second acceleration distance of 21.0 m. The ceramic radial turbine rotor is discussed along with the control system for the powertrain. T.M.

THE NASA LEWIS LARGE WIND TURBINE PROGRAM
R. L. Thomas and D. H. Baldwin 1981 24 p refs Presented at the 5th Biennial Wind Energy Conf. and Workshop, Washington, D.C., 5-7 Oct. 1981
(Contract DE-AI01-79ET-20305)
(NASA-TM-82761; DOE/NASA/20305-7; E-1082) Avail: NTIS HC A01/MF A01 CSCL 10B

The program is directed toward development of the technology for safe, reliable, environmentally acceptable large wind turbines that have the potential to generate a significant amount of electricity at costs competitive with conventional electric generation systems. In addition, these large wind turbines must be fully compatible with electric utility operations and interface requirements. Advances are made by gaining a better understanding of the system design drivers, improvements in the analytical design tools, verification of design methods with operating field data, and the incorporation of new technology and innovative designs. An overview of the program activities is presented and includes results from the first and second generation field machines (Mod-OA, -1, and -2), the design phase of the third generation wind turbine (Mod-5) and the advanced technology projects. Also included is the status of the Department of Interior WTS-4 machine.

(DE82-001069; DOE/ER-01084/T1) Avail: NTIS HC A08/MF A01

The energy exchanger, or pressure exchanger, is a rotating, axial flow machine which utilizes unsteady gasdynamic processes to directly transfer work between two gas streams. A program which has provided technology required for the development of efficient energy exchangers for power operation applications is described. The program contains three major elements: testing of a laboratory scale device; development of an energy exchanger flow model, and analysis of potential applications in advanced power generation cycles. The test energy exchanger was developed and tested over a range of operating conditions. This device transferred approximately 100 kW of mechanical power between two gas streams by simultaneously expanding one stream and compressing the other through pressure ratios of approximately 2.5. The efficiency of this transfer process was as high as 74%.

(DE82-001955; ANL/MHD-80-6) Avail: NTIS HC A06/MF A01

The development of analytical tools needed for investigating the performance of the major components in the combined cycle MHD/steam power system is described. The analytical effort is centered on the primary components of the system that are unique to MHD and, also, on the integration of these analytical models into a model for the entire power producing system. The present project activities include modeling of the secondary combustor, generator, radiant boiler, and formation and decomposition of NO. The results of preliminary off design studies and of system optimization studies are presented, and analysis of the U-25B generator performance, which was done in support of the proposed test plan, is included. Refinements and improvements in the MHD systems code and executive program are considered.

ADVANCED GAS TURBINE (AGT) POWERTRAIN SYSTEM DEVELOPMENT FOR AUTOMOTIVE APPLICATIONS Progress Report, Oct. 1979 - Jun. 1980
Nov. 1980 431 p refs
(Contract DEN3-167)
(NASA-CR-165175; DOE/NASA/0167-80/1; AiResearch-31-3725; PR-1) Avail: NTIS HC A19/MF A01 CSCL 13F

Progress in the development of a gas turbine engine to improve fuel economy, reduce gaseous emissions and particulate levels, and compatible with a variety of alternate fuels is reported. The powertrain is designated AGT101 and consists of a regenerated single shaft gas turbine engine, a split differential gearbox and a Ford Automatic Overdrive production transmission. The powertrain is controlled by an electronic digital microprocessor and associated actuators, instrumentation, and sensors. Standard automotive accessories are driven by engine power provided by an accessory pad on the gearbox. Component/subsystem development progress is reported in the following areas: compressor, turbine, combustion system, regenerator, gearbox/transmission, structures, ceramic components, foil gas bearing, bearings and seals, rotor dynamics, and controls and accessories.

INFLUENCE OF CORRELATIONS AND COMPUTATIONAL METHODS ON THE PREDICTION OF OVERALL EFFICIENCY
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 29-31 refs

Avail: NTIS HC A15/MF A01

The process of designing a gas turbine or a steam turbine begins with an evaluation of the influence of component design parameters on the overall cost. For both the steam turbine and

the gas turbine, energy costs are rapidly increasing and component efficiency is therefore a primary design objective. For the aircraft gas turbine, the weight of the component influences the fuel consumption and is therefore also an important energy cost consideration. Turbine efficiency predictions, together with information which influence the weight and cost, were obtained from flow field calculations which define the thermodynamic properties and velocity triangles throughout the turbine. These computational methods may be full span through flow calculations which predict the fluid properties from the hub to the tip between each blade row or they may be mean line calculations. In either case they are dependent upon loss and deviation models for their effectiveness in the efficiency optimization stage of the design process. The loss and deviation correlations which are in common use by steam turbine and gas turbine manufacturers are frequently developed internally and are maintained as proprietary information. The overall efficiency predictions which are discussed are therefore limited to results obtained using the correlations built into the methods which are described. T.M.

HELICOPTER PROPULSION SYSTEMS: PAST, PRESENT AND FUTURE
Robert R. Lynn and Gordon E. Holbrook *In* AGARD Helicopter Propulsion Systems Sep. 1981 12 p refs

Avail: NTIS HC A13/MF A01

Helicopter propulsion systems are reviewed, and it is noted that helicopter development is paced to a major extent by the power plant. Power available, reliability, fuel consumption, power-to-weight ratio, and life cycle costs are key parameters. The application of emerging technologies such as microelectronics, ceramics and other new materials and approaches, and the continuing refinement of the aerodynamics and dynamics of gas turbine power plants are discussed and noted to result in a significant benefit to the helicopter and its operator. Important airframe-propulsion system interface requirements are given, and the need is discussed for new innovative certification procedures that provide for emergency operation with acceptable economics. Finally, future propulsion system capabilities are projected and their dramatic benefit for the helicopter noted. Author

MECHANICAL ADVANCES IN THE DESIGN OF SMALL TURBOSHAFT ENGINES
J. Dominy and K. J. Hart *In* AGARD Helicopter Propulsion Systems Sep. 1981 12 p

Avail: NTIS HC A13/MF A01

Mechanical components have a significant influence on the efficiency of a small gas turbine engine. Some of the performance losses associated with the design of the power transmission and internal air system are defined and discussed. Improvements in engine efficiency must be considered in conjunction with cost, reliability and size or weight. Many of the problems considered are applicable to gas turbines in general but become acute in small engines due to the adverse effects of scale on many components design parameters. To meet the increasing demand for more efficient powerplants the mechanical research engineer must improve the analysis of mechanical component behavior to produce optimized engine designs. Author

EVALUATION OF THE DESIGN, CONSTRUCTION AND OPERATION OF A GAS FUELED ENGINE DRIVEN HEAT PUMP
C. A. Phillips Jan. 1981 76 p refs
(ERG-034) Avail: NTIS HC A05/MF A01

The design, construction, testing, and evaluation of a gas fueled engine driven heat pump are considered. The heat pump, using air as its source of heat is driven by a 360 cc single cylinder marine engine converted to run on natural gas. The unit was built, installed in a laboratory, and underwent intensive performance testing. The heat pump works well and justifies the design assumptions made, having allowed for a poor performance from the particular engine used. At 6 C (ambient) an output of 14 kW with an overall efficiency or C.O.P. (total heat output/gas input) of 1.1 was achieved. Results compare favorably with a seasonal efficiency of a gas boiler of around 0.65 to 0.70. J.M.S.

STRESS ANALYSIS AND TEST PHILOSOPHY FOR WIND ENERGY CONVERTER BLADES
H. Bansemir and K. Pfeifer 1980 28 p Presented at 4th Meeting of Experts on Rotor Blade Technol. with Special Respect to Fatigue Design Probl., Stockholm, 21-22 Apr. 1980
(NBB-UD-300-80-0) Avail: NTIS HC A03/MF A01

Projected wind energy converter blades for a 5MW plant are described and analyzed. The calculation of laminate cross-section properties as well the overall behavior of the blade is considered. Special attention is given to the bolted area and to the compression stresses in the blade, because it is mainly loaded by bending moments. Tests performed in order to obtain basic data of the materials used in the design are discussed. Special components such as the bolted area are tested by static and dynamic loads. Finally the strains in the entire blade under load and the eigenfrequencies are measured. A.R.H.

(Contract NAS3-22477)
(NASA-CR-165269; MSNW-1169) Avail: NTIS HC A15/MF A01 CSCL 10B

Space power technologies are reviewed to determine the state-of-the-art and to identify advanced or novel concepts which promise large increases in performance. The potential for increased performance is judged relative to benchmarks based on technologies which have been flight tested. Space power technology concepts selected for their potentially high performance are prioritized in a list of R & D topical recommendations for the NASA program on Advanced Energetics. The technology categories studied are solar collection, nuclear power sources, energy conversion, energy storage, power transmission, and power processing. The emphasis is on electric power generation in space for satellite on board electric power, for electric propulsion, or for beamed power to spacecraft. Generic mission categories such as low Earth orbit missions and geosynchronous orbit missions are used to distinguish general requirements placed on the performance of power conversion technology. Each space power technology is judged on its own merits without reference to specific missions or power systems. Recommendations include 31 space power concepts which span the entire collection of technology categories studied and represent the critical technologies needed for higher power, lighter weight, more efficient power conversion in space. PREPARATION AND EVALUATION OF ADVANCED ELECTROCATALYSTS FOR PHOSPHORIC ACID FUEL CELLS Quarterly Report, Oct. - Dec. 1981

Paul Stonehart, John Baris, John Hochmuth, and Peter Pagliaro Dec 1981 44 p

(Contract DEN3-176; Contract DE-AI03-80ET-17088)

(NASA-CR-165594; DOE/NASA/0176-81/5; QR-8) Avail: NTIS HC A03/MF A01 CSCL 10A

Two cooperative phenomena are required the development of highly efficient porous electrocatalysts: (1) is an increase in the electrocatalytic activity of the catalyst particle; and (2) is the availability of that electrocatalyst particle for the electromechanical reaction. The two processes interact with each other so that improvements in the electrochemical activity must be coupled with improvements in the availability of the electrocatalyst for reaction. Cost effective and highly reactive electrocatalysts were developed. The utilization of the electrocatalyst particles in the porous electrode structures was analyzed. It is shown that a large percentage of the electrocatalyst in anode structures is not utilized. This low utilization translates directly into a noble metal cost penalty for the fuel cell. E.A.K.

ASSESSMENT OF THE POTENTIAL OF LWECS IN THE NETHERLANDS

W. Dub *In* Kernsforschungsanlage Implementing Agreement for a Program of Res. and Develop. on Wind Energy Conversion Systems Apr. 1981 p 41-62 refs

Avail: NTIS HC A06/MF A01

The potential of large wind energy conversion systems (LWECS) in the Netherlands is assessed. Hourly data on mean wind speeds and wind directions from 5 stations are analyzed and extrapolated up to a height of 100 m and monthly and annual mean wind speeds. The wind power conversion efficiency of wind turbines and the monthly and annual energy production of WECS 1 are calculated. The daily wind energy production of a compound system of 3 MW wind turbines and the daily percentages of the 1980 national electric power needs they would meet are determined using 1975 wind data. The number of 3 MW and 0.8 MW wind turbines required to produce 9.97 TWh per year is determined. J.D.H.

ASSURED LOAD CARRYING CAPABILITY AND CAPACITY CREDIT

H. Pape *In* Kernsforschungsanlage Implementing Agreement for a Program of Res. and Develop. on Wind Energy Conversion Systems Apr. 1981 p 81-95 refs

Avail: NTIS HC A06/MF A01

The determination of assured load carrying capability and the capacity credit for use in planning windpowered electric generation facilities is considered. Calculation of the available capacity of thermal power plants is described and compared with calculation of available capacity for wind turbines, taking into account outages caused by the unavailability of the primary energy, wind. The assured load carrying capability of power plants is defined. An operational definition of the capacity credit of wind turbines as related to a fixed time t Epsilon T is presented and extended to the period T. J.D.H.

POSSIBILITIES FOR AVOIDING STRONG VARIATIONS OF THE ELECTRICAL OUTPUT POWER OF WIND ENERGY SYSTEMS [MOEGLICHKEITEN ZUR VERMEIDUNG VON STARKEN SCHWANKUNGEN DER ELEKTRISCHEN ABGABELEISTUNG VON WINDENERGIEANLAGEN]

G. Cramer *In* Kernsforschungsanlage Implementing Agreement for a Program of Res. and Develop. on Wind Energy Conversion Systems Apr. 1981 p 96-99 refs

Avail: NTIS HC A06/MF A01

The conversion of the kinetic energy of wind into electric power through wind powered converters by the primary energy of atmospheric circulation speed is discussed. It is suggested that wind powered generators which work with the supply network should avoid overloading the installation from wind performance caused by a fast change of the blade pitch. There are possibilities to achieve numerical comparison of the temporary storage performance of kinetic energy by application of rotating masses with flywheels, which allow for rotation speed variations. Through the feed of direct or alternate current in the rotor cycle form asynchronic machines with slip rings or through the influence of the slip performance a speed of variable duty on the network is accomplished. E.A.K.

(ISD-274; ISD-261; ISSN-0170-6071) Avail: NTIS HC A06/MF A01

The kinematics of a cantilevered, a conventional guyed, and a compliant (elastic column held by a rigid framework) tower were studied. The static layout of the towers is established, using the reactions due to different gusts which a two-bladed rotor (120 m diameter) imposes on a rigid support as external loads. The rotor blades are assumed to be inelastic. Each one has a flapping hinge and a flap-pitch coupling. Dynamic responses were calculated by the finite element method. The guyed tower is superior to the cantilevered one. A 10.4 deg inclination angle seems best for the compliant tower, but more dynamic and

stability analyses are needed before undertaking further tower geometry optimization. Author (ESA)

(ISD-269; ISD-243; ISSN-0170-6071) Avail: NTIS HC A04/MF A01

Several rotorblades of a horizontal axis windmill are studied both nonoperating under deadweight and under quasi-stationary loading with constant forces at rated operation, the blades of which have flap and lead-lag freedom as well as flap-pitch coupling. With a suitable mass distribution it is possible to reduce the blade bending moments in the flap direction drastically. The use of aircraft construction materials is considered. Carbon fiber reinforced plastic is the most suitable. Most of the blade models are investigated without lag hinge. The coning angle of rated operation assumed for the layout is reduced considerably for the blade models with lead-lag freedom in order to obtain sufficient centrifugal stiffness in the lag direction. (Contract BMFT-ET-4086-A)

(ISD-270; ISD-244; ISSN-0170-6071) Avail: NTIS HC A04/MF A01

The coupled flap lag motion of a single, rigid rotor blade of a wind energy converter with flap and lag hinges and a coupling of the angle of attack with the flap motion is investigated. The equations of motion are developed under the assumption of linearized quasi-stationary aerodynamic forces. Static and dynamic stability of the coupled flap and lag motion are investigated. The equations are integrated for different cases under cyclic gravitational forces in order to estimate the importance of nonlinear terms and of the error resulting from the linearization of the conservative system. The nonlinear terms can be neglected, as can the effects of cyclic stiffness resulting from gravitational force. Results for nonlinearities arising from aerodynamic forces are inconclusive. ISD-258 Stuttgart Univ., Stuttgart, 1979 95 p Original report in GERMAN previously announced as N80-30950 Sponsored in cooperation with International Energy Agency

(Contract BMFT-ET-4086-A)

(ISD-271; ISD-258; ISSN-0170-6071) Avail: NTIS HC A06/MF A01

For a windmill rotor blade, a linearized system of differential equations of motion is developed, using a finite element idealization of linearized quasi-stationary aerodynamic forces. Constant rotational speed and a rigidly supported hub are assumed. For two rotor blade models, which differ only in their stiffness in lag direction, the complex eigenfrequencies are calculated. The dynamic response of the rotor blades is computed for cyclic gravity loads at rated operation, for a gust, and, in one case, for the tower wake. From the deformation of the structure the stresses at selected points along the blade are calculated. Torque and rotor thrust are determined for one model. Additional stiffness improves stability and lead-lag angles. The coning angle is excellently stabilized by the flap-pitch coupling. Author (ESA)

STATIC AND DYNAMIC INVESTIGATIONS FOR THE MODEL OF A WIND ROTOR Final Report

J. H. Argyris, K. A. Braun, B. Kirchgaessner, and R. Walther 1980 71 p refs Transl. into ENGLISH of "Statische und dyn. untersuch. and einem windrotormodell" Rept. ISD-259 Stuttgart Univ., Stuttgart, Jun. 1979 69 p Original report in GERMAN previously announced as N81-12626 Sponsored in cooperation with International Energy Agency

(Contract BMFT-ET-4086-A)

(ISD-272; ISD-259; ISSN-0170-6071) Avail: NTIS HC A04/MF A01

A wind rotor was constructed in order to test a data acquisition/transfer system which collects experimental data from the operating model and displays it on a screen. The comparison between the experimental data and the model results is used to check the applied computation methods. The static and dynamic analyses of the rotor model are considered. An 11% difference between experimental and model results is shown. A response problem with variable stiffness in time which arose during the dynamic analysis is solved by setting the structural stiffness constant over small time intervals, diagonalizing the time interval considered and integrating. After integration the solutions of the generalized degrees of freedom are transformed back into the physical system, using the time interval eigenvectors.

LOADING CYCLES AND MATERIAL DATA FOR THE LAYOUT OF A WIND TURBINE OF SPECIAL HUB CONCEPT Final Report

J. H. Argyris and K. A. Braun 1980 38 p refs Transl. into ENGLISH of "Lastwechselzahlen und materialwerte fuer die auslegung einer windturbine spezieller nabenkonstruktion" Rept. ISD-260 Stuttgart Univ., Stuttgart, Jun. 1979 38 p Original report in GERMAN previously announced as N81-12627 Sponsored in cooperation with International Energy Agency

(Contract BMFT-ET-4086-A)

(ISD-273; ISD-260; ISSN-0170-6071) Avail: NTIS HC A03/MF A01

The number of loading cycles of a rotor blade was estimated in order to assess allowable blade stress. Fatigue strengths and allowable stresses are calculated for aeronautic construction materials. Using wind data, the number of starts and stops was estimated. With a guess for the number of revolutions necessary to reach stationary operation from standstill, the number of loading cycles was determined, using the blade aerodynamics. The number of operational hours gives the number of loading cycles for rated operation. Rotation speeds of 1.67 and 2 rad/sec are considered. For 1.67, the number of loading cycles during stationary operation = 2.06 x 10 to the 8th power; during starts and cut offs = 357,000. For 2 rad/sec, results are 2.47 x 10 to the 8th power and 463,000. Stress values, expressed in installed power/sqmm, are: aluminum alloy = 98; stainless steel = 294; glass fiber reinforced plastic = 98; and carbon fiber reinforced plastic = 147. Author (ESA)

METEOROLOGICAL ASPECTS OF THE UTILIZATION OF WIND AS AN ENERGY SOURCE

1981 201 p refs

(WMO-575; ISBN-92-63-10575-8; WMO-TN-175) Avail: NTIS MF A01; print copy available at WMO, Geneva SwFr 40

The application of meteorological data and knowledge to the planning and operation of wind energy conversion systems (WECS) is discussed. The development of WECS and WMO activities related to energy matters, with special regard to wind energy, is reviewed. Atmospheric circulation systems of various scales, atmospheric turbulence, and the boundary layer are considered, including numerical models. Wind energy technology, i.e., the different types of wind machines (both small and large conversion systems) together with their usual possibilities of application, and the environmental impact of WECS, which should be kept in mind in the planning stage in order to reduce it to a minimum, are treated. As to wind energy meteorology, the requirements for, and the availability of, meteorological data for use in the exploratory, planning and operational phases of WECS are determined. The economic aspects of deciding on the establishment of wind energy systems are also indicated. A world map, illustrating the global distribution of wind energy potential is included. Author (ESA)

AN EXTENSION OF THE LOCAL MOMENTUM THEORY TO THE ROTORS OPERATING IN TWISTED FLOW FIELD

Akira Azuma, Ken-ichi Nasu, and Takatoshi Hayashi *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 19 p refs

Avail: NTIS HC A99/MF A01

The local momentum theory was developed to calculate the dynamic airloading of a helicopter rotor, where the velocity perpendicular to the plane of rotation was assumed to be negligibly low in comparison with the rotating velocity. In the case of propellers or windmills, however, this assumption is no longer adequate, and the flow field seen in the rotor-fixed-coordinate system is noticeably twisted along the span. In order to permit calculation of the induced velocity distribution as well as the airloading of the blade in such a twisted flow field, we have carried out an extension of the local momentum theory. Since our method of calculation is based on the instantaneous circulation distribution rather than the instantaneous momentum balance, it may be called the Local Circulation Method. The present method is also applicable to propellers and windmills in yawed flow. Author

MODAL CHARACTERISTICS OF ROTOR BLADES: FINITE ELEMENT APPROACH AND MEASUREMENT BY GROUND VIBRATION TEST

D. Ludwig *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 23 p refs

Avail: NTIS HC A99/MF A01

The mass and stiffness matrices for a rotating blade are established by the finite element method. The formulation is based on the Lagrange function for combined flapwise bending, chordwise bending, and torsion of twisted nonuniform rotor blades. The element matrices are created by the non-numeric computer program REDUCE. An ordering scheme was introduced to demonstrate which terms may be simplified or neglected. As examples, eigen analyses, with the finite element computer program, are performed for a homogeneous beam and for the nonrotating blade of a wind energy converter. The results of the calculations for the beam are compared with the analytical solutions. The rotor blade of the wind energy converter was tested in a ground vibration test. A short description of the ground vibration test technique and performance is given. N.W.

DYNAMIC AND AEROELASTIC CHARACTERISTICS OF COMPLETE WINDTURBINE SYSTEMS

E. W. Steinhardt *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p refs

Avail: NTIS HC A99/MF A01

For the investigation of the dynamic and aeroelastic characteristics of large horizontal axis windturbines, a hybrid model consisting of rigid bodies and flexible continuous structures was developed. Degrees of freedom include tower bending and torsion, pitch and yaw of the nacelle as well as rotation, inplane and out-of-plane bending of the blades. Aerodynamic forces are introduced with special regard to motion-induced effects and on gusts. A set of partial integro-differential equations was established via the principle of virtual work. The application of Galerkin's extended method gives a system of linear periodic differential equations. The numerical results confirm strong rotor-tower-coupling and illustrate the typical features of periodic systems. Instationary aerodynamic terms are found to be of minor importance and hingeless rotors will be damped better than teetering rotors, but tower and blade reactions to gravity and gusts are higher. DESIGN, EVALUATION, AND FABRICATION OF LOW-COST COMPOSITE BLADES FOR INTERMEDIATE-SIZE WIND TURBINES Final Report

Oscar Weingart Sep. 1981 210 p refs

(Contracts DEN3-100; DE-AI01-79ET-20320)

(NASA-CR-165342; DOE/NASA/0100-1; SCI-81520) Avail: NTIS HC A10/MF A01 CSCL 10A

Low cost approaches for production of 60 ft long glass fiber/resin composite rotor blades for the MOD-0A wind turbine were identified and evaluated. The most cost-effective configuration was selected for detailed design. Subelement and subscale specimens were fabricated for testing to confirm physical and mechanical properties of the composite blade materials, to develop and evaluate blade fabrication techniques and processes, and to confirm the structural adequacy of the root end joint. Full-scale blade tooling was constructed and a partial blade for tool and process tryout was built. Then two full scale blades were fabricated and delivered to NASA-LeRC for installation on a MOD-0A wind turbine at Clayton, New Mexico for operational testing. Each blade was 60 ft. long with 4.5 ft. chord at root end and 2575 lbs weight including metal hub adapter. The selected blade configuration was a three cell design constructed using a resin impregnated glass fiber tape winding process that allows rapid wrapping of primarily axially oriented fibers onto a tapered mandrel, with tapered wall thickness. The ring winder/transverse filament tape process combination was used for the first time on this program to produce entire rotor blade structures. This approach permitted the complete blade to be wound on stationary mandrels, an improvement which alleviated some of the tooling and process problems encountered on previous composite blade programs. ASSESSMENT OF STEAM-INJECTED GAS TURBINE SYSTEMS AND THEIR POTENTIAL APPLICATION

Robert J. Stochl Feb. 1982 21 p refs

(NASA-TM-82735; E-1047) Avail: NTIS HC A02/MF A01 CSCL 10B

Results were arrived at by utilizing and expanding on information presented in the literature. The results were analyzed and compared with those for simple gas turbine and combined cycles for both utility power generation and industrial cogeneration applications. The efficiency and specific power of simple gas turbine cycles can be increased as much as 30 and 50 percent, respectively, by the injection of steam into the combustor. Steam-injected gas turbines appear to be economically competitive with both simple gas turbine and combined cycles for small, clean-fuel-fired utility power generation and industrial cogeneration applications. For large powerplants with integrated coal gasifiers, the economic advantages appear to be marginal. T.M.

CALCULATION OF THERMODYNAMIC EQUILIBRIA IN THE CARBONATE FUEL CELL, VOLUME 1. TASK 1: BINARY TERNARY AND QUARTERNARY PHASE DIAGRAMS CONTAINING Li(+), Na(+), K(+), CO3(=), SO3(=) AND OH(-) Final Report

A. D. Pelton, C. W. Bale, P. L. Lin, M. L. Saboungi, and M. Blander 31 Aug. 1981 182 p refs Prepared in cooperation with Argonne National Lab. 2 Vol.

(Contract DE-AC02-79ET-15416)
(DE82-000690: DOE/ET-15416/2-Vol-1) Avail. NTIS HC A09/MF A01

All available phase diagram and thermodynamic data on the eighteen binary systems containing Li(), Na(), K(), SO4(2+), and OH(+) have been collected and critically assessed. A set of self consistent thermodynamic parameters describing the free energies of all known compounds, solid solutions, and liquid solutions in the binary systems has been formulated. The phase diagrams have been calculated, and estimated error limits of all diagrams are given. Fourteen ternary phase diagrams containing Li(), Na(), K(), SO4(2+), CO3(2+) and OH(+) have been calculated from the assessed data for their binary subsystems with the aid of the Conformal Ionic Solution Theory. Comparison with experimental data is made where experimental diagrams are available and small ternary parameters are added where necessary. All calculated ternary phase diagrams are presented as polythermal projections of liquidus surfaces, and estimated error limits are given for each system. DOE

(DE82-000689: DOE/ET-15416/2-Vol-2) Avail: NTIS HC A04/MF A01

A complete thermodynamic analysis has been performed upon eleven selected fuel feeds obtained after various pretreatment processes. The equilibrium partial pressures of some 34 gaseous species have been computed for each of the fuels at the anode inlet and outlet (75% hydrogen utilization). The complex gaseous equilibria of the fuels have been graphically represented with the aid of Gibbs ternary C-H-O composition triangles. The influence of temperature and pressure upon carbon deposition in the anode compartment has been determined and graphically presented. The effect of water addition upon carbon formation and upon free hydrogen production has been evaluated. The influence of sulfur impurities upon the gaseous equilibria in both electrode compartments and upon the chemical stability of the Ni/NiO electrodes has been assessed. DOE

HIGH-TEMPERATURE, SOLID-OXIDE-ELECTROLYTE FUEL-CELL POWER-GENERATING SYSTEM Quarterly Report, 1 Dec. 1980 - 28 Feb. 1981
22 Mar. 1981 60 p refs
(Contract DE-AC02-80ET-1709)
(DE82-002095: DOE/ET-17089/T2) Avail: NTIS HC A04/MF A01

Porous support tube work was directed at reducing the firing temperature, where electrically heated furnaces that enable better zone temperature control can be utilized. Work on the air electrode for the FEA cell design concentrated on modifying the lanthanum manganite, to enhance its conductivity while matching its thermal expansion to that of the other fuel cell components. The thermal expansion and electrical resistivity of La0 5Ca0 5MnO3 were determined. An initial FBA cell was fabricated. Although its performance was below that of the cells in the series cell stack arrangement, it did prove that fabrication of all fuel cell components (including the interconnection) can be accomplished in this cell design. Analytical measurements on an actual HTSOE cell stack resulted in the use of the differential resistance ((RADIAL)V/(RADICAL)I) to isolate voltage losses under operating conditions, envisaged for the HTSOE fuel cell generator. A TWO DIMENSIONAL STUDY OF THE MAXIMUM POWER THAT CAN BE OBTAINED FROM A WIND TURBINE IN A WIND SHEAR LAYER
Bo C. A. Johansson Apr. 1981 59 p refs
(FFA-134; ISSN-0081-5640) Avail: NTIS HC A04/MF A01; Aeronautical Research Inst. of Sweden, Stockholm Kr 70

Betz's stream tube theory for the maximum power that can be obtained from a wind turbine in a uniform flow is extended to two dimensions. The undisturbed velocity field (allowed to vary arbitrarily vertically) and the location of the wind turbine are given. The maximum power is calculated by calculus of variations. For common wind velocity profiles, the maximum power is only slightly larger than the power, which is obtained by a constant relative wind speed retardation equal to Betz's retardation, while for a linear velocity profile there is a considerable difference. MEASUREMENTS OF WAKE INTERACTION EFFECTS ON THE POWER OUTPUT FROM SMALL WIND TURBINE MODELS
Per-Henrik Alfredsson and Jan-Aake Dahlberg 4 Jul. 1981 62 p refs
(Contracts NE-5061-013; NE-5061-014)
(FFA-TN-HU-2189-Pt-5; ISSN-0081-5640) Avail: NTIS HC A04/MF A01

Power interference between two and three wind turbine models in a wind tunnel at four different ambient turbulence conditions was measured in order to assess turbine drag effects. Maximum power coefficient is 0.35 with a corresponding thrust coefficient of 0.85 at a tip speed ratio of 4. Flow visualization with small spacing between the turbines (2 x D) and power interaction measurements show that the presence of a downstream turbine affects the upstream turbine wake. By traversing a turbine across the wake of an upstream turbine, a chart of constant power lines (iso power lines) was established for the four ambient flow conditions. The power measurements in the wake can be used to estimate the overall efficiency of a limited array of wind turbines. Author (ESA)

ICING PROBLEMS FOR WIND TURBINES. SUMMARY OF STUDIES PERFORMED DURING WINTER SEASON 1980/81
Anders Gustafsson, Tord Kvick, and Staffan Meijer (Swedish Meteorological and Hydrological Inst.) 6 Oct. 1981 30 p refs Prepared in cooperation with Sydkraft AB
(Contract NE-5061-014)
(FFA-TN-HU-2262-Pt-4) Avail: NTIS HC A03/MF A01

The significance of an ice detector signal which shuts down a wind energy conversion system, not equipped with deicers, was studied. Correlations between the detector signal, meteorological parameters and ice buildup on the blades were investigated. Theoretical and field study data were used. Visual checks followed icing signals but little ice was observed since icing mostly occurred at night. The data are inadequate to enable conclusions to be drawn. Time lag between signals and visual observation must be shortened. Data must be collected when icing is expected, even if there is no signal. Author (ESA)

RADIATIVE HEAT TRANSFER IN TURBULENT MHD CHANNEL FLOW Ph.D. Thesis
Fariborz Alipour-Haghighi 1981 148 p
Avail: Univ. Microfilms Order No. 8128371

Radiative heat transfer in a MHD channel has been studied for fully developed turbulent flow of an electrically conducting fluid. A uniform magnetic field is imposed transverse to the flow direction between the electrically insulated parallel plates. Thermal entry region is analyzed for constant wall temperature including viscous dissipation and Joulean heating. A van Dreist mixing length model with Mei and Squire correction factor is used for eddy diffusivity of momentum and a modified Cebeci model is used for eddy conductivity. An exponential wide band model is employed in evaluation of radiative heat flux for a real gas. The tegro-differential equation for thermal energy transport is solved by a finite difference iterative method. It is shown that radiative heat transer is a major mechanism of heat transfer in the channel and accelerates the thermal development and results in reduced gas temperature profiles. Dissert. Abstr.

EXPERIENCE WITH MODIFIED AEROSPACE RELIABILITY AND QUALITY ASSURANCE METHOD FOR WIND TURBINES

William E. Klein 1982 11 p refs Proposed for Presentation at 9th Ann. Engr. Conf. on Reliability, Hershey, Penn., 16-18 Jun. 1982 Revised
(Contract DE-AI01-76ET-20320)
(NASA-TM-82803; DOE/NASA/20320-38; E-1142) Avail: NTIS HC A02/MF A01 CSCL 14D

The SR&QA approach assures that the machine is not hazardous to the public or operating personnel, can operate unattended on a utility grid, demonstrates reliability operation, and helps establish the quality assurance and maintainability requirements for future wind turbine projects. The approach consisted of modified failure modes and effects analysis (FMEA) during the design phase, minimal hardware inspection during parts fabrication, and three simple documents to control activities during machine construction and operation. Five years experience shows that this low cost approach works well enough that it should be considered by others for similar projects. T.M.

TIDAL POWER FROM THE SEVERN ESTUARY, VOLUME 1
1981 125 p refs Original contains color illustrations 2 Vol.
(EP-46-Vol-1; ISBN-0-11-410916-8) Copyright. Avail: Issuing Activity; HMSO £9.80 + postage, PHI

Environmental, energy, and economic factors associated with building a tidal power barrage in the Bristol channel were studied. An ebb generation scheme is recommended since it minimizes the unit cost of electricity generation and has less effect on ports than flood or two way generation. The economic justification for a barrage depends on factors which are not known when the decision on whether to build is taken, e.g., the extent of nuclear generation, or the price of coal in the first third of the next century. Further study of the environmental consequences of the barrage is required. An inner barrage is recommended since the larger output of an outer barrage does not outweigh engineering, environmental and economic disadvantages. Author (ESA)

PERFORMANCE AND OPERATIONAL ECONOMICS ESTIMATES FOR A COAL GASIFICATION COMBINED-CYCLE COGENERATION POWERPLANT
Joseph J. Nainiger, Raymond K. Burns, and Annie J. Easley Mar. 1982 32 p refs
(NASA-TM-82729; E-1032) Avail: NTIS HC A03/MF A01 CSCL 10B

A performance and operational economics analysis is presented for an integrated-gasifier, combined-cycle (IGCC) system to meet the steam and baseload electrical requirements. The effect of time variations in steam and electrial requirements is included. The amount and timing of electricity purchases from sales to the electric utility are determined. The resulting expenses for purchased electricity and revenues from electricity sales are estimated by using an assumed utility rate structure model. Cogeneration results for a range of potential IGCC cogeneration system sizes are compared with the fuel consumption and costs of natural gas and electricity to meet requirements without cogeneration. The results indicate that an IGCC cogeneration system could save about 10 percent of the total fuel energy presently required to supply steam and electrical requirements without cogeneration. Also for the assumed future fuel and electricity prices, an annual operating cost savings of 21 percent to 26 percent could be achieved with such a cogeneration system. An analysis of the effects of electricity price, fuel price, and system availability indicates that the IGCC cogeneration system has a good potential for economical operation over a wide range in these assumptions. The cheap mass production of stabilized zirconia ceramic bodies with thin walls, suitable for high temperature fuel cell or water electrolysis applications is discussed. Chemical and thermal corrosion effects were laboratory tested. Such bodies sintered from YZ03-YbZ03 and YZ03 doped zirconia with high density, good electrical conductivity, small grain size, and 5 mm wall thickness can be produced by conventional methods at temperatures > 1700 C. Extremely fine grained structure ceramics of almost theoretical density can be produced at 1600 C using coprecipitated powders. These powders are, however, too expensive for mass production. A PITCH CONTROL SYSTEM FOR LARGE SCALE WIND TURBINES
Brad S. Liebst 12 Jan. 1981 146 p. refs Sponsored in cooperation with Aeronautical Research Foundation Prepared in cooperation with MIT
(Contract NE-5061-014)
(FFA-TN-HU-2262-Pt-6) Avail: NTIS HC A07/MF A01

A pitching blade segment control system, to alleviate problems associated with wind shear, tower shadow, and gravity, like shortened lifetime and noise generation was designed. The classical linear quadratic Gaussian optimal regulator approach is used in the control formulation. An aerodynamic analysis, incorporating wind shear and tower shadow, is performed. An equivalent hinge model describes the turbine structural dynamics.

Pitch, flap and lag blade degrees of freedom and shaft torsion and generator dynamics are included. It is shown that the system reduces vibration and noise, provides a cleaner power signal, improves gust response, and increases annual energy output.

(Contract NAS8-34387)
(NASA-CR-3532; NAS 1.26:3532) Avail: NTIS HC A03/MF A01 CSCL 10A

A wind wheel turbine (WWT) is studied. Evaluation of the probable performance, possible practical applications, and economic viability as compared to other conventional wind energy systems is discussed. The WWT apparatus is essentially a bladed wheel which is directly exposed to the wind on the upper half and exposed to wind through multiple ducting on the lower half. The multiple ducts consist of a forward duct (front concentrator) and two side ducts (side concentrators). The forced rotation of the wheel is then converted to power through appropriate subsystems. Test results on two simple models, a paper model and a stainless steel model, are reported. Measured values of power coefficients over wind speeds ranging from 4 to 16 m/s are given. An analytical model of a four bladed wheel is also developed. Overall design features of the wind turbine are evaluated and discussed. Turbine sizing is specified for a 5 and 25 kW machine. Suggested improvements to the original design to increase performance and performance predictions for an improved WWT design are given.

ASSESSMENT OF THE SUITABILITY OF AGRICULTURAL WASTE WATER FOR GEOTHERMAL POWER PLANT COOLING IN THE IMPERIAL VALLEY. 1: WATER QUALITY
W. F. Morris Sep. 1981 36 p refs
(Contract W-7405-eng-48)
(DE82-001869; UCID-19205) Avail: NTIS HC A03/MF A01

Evaluation of the quality of agricultural waste water is the first step in assessing the suitability of agricultural waste water for geothermal power plant cooling. Samples of agricultural waste water from the New and Alamo rivers located in the Imperial Valley of California were analyzed. Determinations of standard water quality parameters, solids content, and inorganic compositions of the solids were made. The results are compared with data on samples of irrigation water and steam condensate also obtained from sites in the Imperial Valley. The data were evaluated in relation to cooling tower operation, waste generation, and waste disposal.

ELECTRIC UTILITY VALUE ANALYSIS METHODOLOGY FOR WIND ENERGY CONVERSION SYSTEMS
L. R. Bush, C. Keith Cretcher, and Ted H. Davey Sep. 1981 31 p refs
(Contract DE-AC02-77CH-00178)
(DE82-003573; SERI/TR-98336-1) Avail: NTIS HC A03/MF A01

The methodology summarized in this report was developed in support of a study of the value of augmenting conventional electric energy generation with wind energy conversion systems (WECS). A major objective of the value analysis study is the creation of an analytical methodology to assess WECS installed in a utility's generation system. The pertinent measures of value include both the displacement of conventional fuels measured in volumetric and economic terms, and the potential for capacity credit, realized either through the sale of capacity of deferral of new installations. Recognizing the strong site dependence of wind energy conversion, a second major objective of the value analysis study is the application of the methodology to several candidate utilities. These results will illustrate the practicability of the methodology and identify any deficiencies, allow a comparison of relative WECS value among the sites studied, and develop background information pertinent to possible selection decisions for WECS siting and level of penetration. The specific purpose of this report is to outline the methodology developed in support of the value analysis study.

(Contract NAS1-14970; Grant NAG1-166)
(NASA-CR-165856; NAS 1.26:165856) Avail: NTIS HC A02/MF A01 CSCL 20A

Sound measurements are reported for a wind velocity of about 5 m/s and a power output of about 70 kW. Both broadband and narrowband data were obtained for a range of distances and azimuth angles from the machine. Both discrete frequency and broadband components were identified. Loading harmonics at multiples of the blade passage frequency and electrical generator harmonics at multiples of the shaft speed dominated the spectrum below 100 Hz. The 10,000 Hz peak is believed to be of mechanical origin in the nacelle and the other arises from blade aerodynamic sources. Aural detection distances of about 525 m upwind and 850 downwind were observed. T.M.

COLD-AIR PERFORMANCE OF A 15.41-cm-TIP-DIAMETER AXIAL-FLOW POWER TURBINE WITH VARIABLE-AREA STATOR DESIGNED FOR A 75-kW AUTOMOTIVE GAS TURBINE ENGINE Final Report
Kerry L. McLallin, Milton G. Kofskey, and Robert Y. Wong Feb. 1982 33 p refs
(Contract DE-AI01-77CS-51040)
(NASA-TM-82644; E-899; NAS 1.15:82644; DOE/NASA/51040-30) Avail: NTIS HC A03/MF A01 CSCL 21E

An experimental evaluation of the aerodynamic performance of the axial flow, variable area stator power turbine stage for the Department of Energy upgraded automotive gas turbine engine was conducted in cold air. The interstage transition duct, the variable area stator, the rotor, and the exit diffuser were included in the evaluation of the turbine stage. The measured total blading efficiency was 0.096 less than the design value of 0.85. Large radial gradients in flow conditions were found at the exit of the interstage duct that adversely affected power turbine performance. Although power turbine efficiency was less than design, the turbine operating line corresponding to the steady state road load power curve was within 0.02 of the maximum available stage efficiency at any given speed. PRELIMINARY RESULTS ON PERFORMANCE TESTING OF A TURBOCHARGED ROTARY COMBUSTION ENGINE
P. R. Meng, W. J. Rice, H. J. Schock, and D. P. Pringle 1982 24 p refs Presented at the 1982 Soc. of Automotive Engrs. Intern. Congr. and Exposition, Detroit, 22-26 Feb. 1982
(NASA-TM-82772; E-1097; NAS 1.15:82772) Avail: NTIS HC A02/MF A01 CSCL 21E

The performance of a turbocharged rotary engine at power levels above 75 kW (100 hp) was studied. A twin rotor turbocharged Mazda engine was tested at speeds of 3000 to 6000 rpm and boost pressures to 7 psi. The NASA developed combustion diagnostic instrumentation was used to quantify indicated and pumping mean effect pressures, peak pressure, and face to face variability on a cycle by cycle basis. Results of this testing showed that a 5900 rpm a 36 percent increase in power was obtained by operating the engine in the turbocharged configuration. When operating with lean carburetor jets at 105 hp (78.3 kW) and 4000 rpm, a brake specific fuel consumption of 0.45 lbm/lb-hr was measured. B.W.

ENERGY EFFICIENT ENGINE SHROUDLESS, HOLLOW FAN BLADE TECHNOLOGY REPORT
C. J. Michael Dec. 1981 91 p refs
(Contract NAS3-20646)
(NASA-CR-165586; NAS 1.26:165586; PWA-5594-199) Avail: NTIS HC A05/MF A01 CSCL 21E

The Shroudless, Hollow Fan Blade Technology program was structured to support the design, fabrication, and subsequent evaluation of advanced hollow and shroudless blades for the Energy Efficient Engine fan component. Rockwell International was initially selected to produce hollow airfoil specimens employing the superplastic forming/diffusion bonding (SPF/DB) fabrication technique. Rockwell demonstrated that a titanium hollow structure could be fabricated utilizing SPF/DB manufacturing methods. However, some problems such as sharp internal cavity radii and unsatisfactory secondary bonding of the edge and root details prevented production of the required quantity of fatigue test specimens. Subsequently, TRW was selected to (1) produce hollow airfoil test specimens utilizing a laminate-core/hot isostatic press/diffusion bond approach, and (2) manufacture full-size hollow prototype fan blades utilizing the technology that evolved from the specimen fabrication effort. TRW established elements of blade design and defined laminate-core/hot isostatic press/diffusion bonding fabrication techniques to produce test specimens. This fabrication technology was utilized to produce full size hollow fan blades in which the HIP'ed parts were cambered/twisted/isothermally forged, finish machined, and delivered to Pratt & Whitney Aircraft and NASA for further evaluation. MICROPROCESSOR CONTROL SYSTEM FOR 200-KILOWATT MOD-0A WIND TURBINES Final Report
Ted W. Nyland and Arthur G. Birchenough Jan. 1982 26 p refs
(Contract DE-AI01-76ET-20370)
(NASA-TM-82711; E-10006; NAS 1.15:82711; DOE/NASA/20370-22) Avail: NTIS HC A03/MF A01 CSCL 10A

The microprocessor system and program used to control the operation of the 200-kW Mod-0A wind turbines is described. The system is programmed to begin startup and shutdown sequences automatically and to control yaw motion. Rotor speed and power output are controlled with integral and proportional control of the blade pitch angle. Included in the report are a description of the hardware and a discussion of the software programming technique. A listing of the PL/M software program is given. Author

EXPERIMENTAL PERFORMANCE OF THE REGENERATOR FOR THE CHRYSLER UPGRADED AUTOMOTIVE GAS TURBINE ENGINE Final Report
Jerry M. Winter and Ralph C. Nussle Feb. 1982 62 p refs
(Contract DE-AI01-77CS-51040)
(NASA-TM-82671; E-953; DOE/NASA/51040-32; NAS 1.15:82671) Avail: NTIS HC A04/MF A01 CSCL 10B

Automobile gas turbine engine regenerator performance was studied in a regenerator test facility that provided a satisfactory simulation of the actual engine operating environment but with independent control of airflow and gas flow. Velocity and temperature distributions were measured immediately downstream of both the core high-pressure-side outlet and the core low-pressure-side outlet. For the original engine housing, the regenerator temperature effectiveness was 1 to 2 percent higher than the design value, and the heat transfer effectiveness was 2 to 4 percent lower than the design value over the range of test conditions simulating 50 to 100 percent of gas generator speed. Recalculating the design values to account for seal leakage decreased the design heat transfer effectiveness to values consistent with those measured herein. A baffle installed in the engine housing high-pressure-side inlet provided more uniform velocities out of the regenerator but did not improve the effectiveness. A housing designed to provide more uniform axial flow to the regenerator was also tested. Although temperature uniformity was improved, the effectiveness values were not improved. Neither did 50-percent flow blockage (90 degree segment) applied to the high-pressure-side inlet change the effectiveness significantly. Author

CELL MODULE AND FUEL CONDITIONER DEVELOPMENT Quarterly Report, Oct. - Dec. 1981

J. M. Feret Jan. 1982 51 p

(Contract DEN3-161; Contract DE-AI01-80ET-17088)

(NASA-CR-165620; DOE/NASA/0161-9A; NAS 1.26:165620; QR-9) Avail: NTIS HC A04/MF A01 CSCL 10A

The efforts performed to develop a phosphoric acid fuel cell (PAFC) stack design having a 10 kW power rating for operation at higher than atmospheric pressure based on the existing Mark II design configuration are described. The work involves: (1) Performance of pertinent functional analysis, trade studies and thermodynamic cycle analysis for requirements definition and system operating parameter selection purposes, (2) characterization of fuel cell materials and components, and performance testing and evaluation of the repeating electrode components, (3) establishment of the state-of-the-art manufacturing technology for all fuel cell components at Westinghouse and the fabrication of short stacks of various sites, and (4) development of a 10 kW PAFC stack design for higher pressure operation utilizing the top down systems engineering approach. . WIND POWER UTILIZATION GUIDE Progress Report, Jul. 1975 - Sep. 1980

D. Pal Sep. 1981 218 p refs

(AD-A110337; CEL-TN-1613) Avail: NTIS HC A10/MF A01 CSCL 04/2

This report presents general information covering site wind potential and characteristics, specific design, system design, and siting requirements for utilization of wind energy conversion systems (WECS) at Navy installations. The objective of this report is also to provide a method for performing economic analysis to plan and justify a WECS in a particular Navy application. The information presented here is sufficient to enable an engineer to prepare a system's design to conduct a feasibility study for a given application of WECS. Most Navy applications of wind power will involve generation of electricity using small wind turbine generators (less than 60 kW size), with or without storage, located at remote Navy sites. Larger (over 100 kW size) WECS will, generally, be integrated with a base grid located on remote overseas or CONUS bases. This report, however, deals only with guidance for applying small WECS at Navy installations. The subject matter is divided into five parts dealing respectively with wind behavior and its determination with wind-driven turbines, power conditioning requirements, siting requirements, and the economics of wind power under different conditions. Three examples are given to demonstrate use of these sections in developing the required feasibility or design information for a given application. Author (GRA)

ADVANCED FUEL-CELL DEVELOPMENT Progress Report, Jul. - Sep. 1980

R. D. Pierce, R. M. Arons, J. T. Dusek, A. V. Fraioli, G. H. Kucera, R. B. Poeppel, J. W. Sim, J. L. Smith, and R. S. Tani Jul. 1981 37 p refs

(Contract W-31-109-eng-38)

(DE82-003007; ANL-81-16) Avail: NTIS HC A03/MF A01

Efforts were directed toward: investigating alternative concepts for components of molten carbonate fuel cell stacks; and improving out understanding of component behavior. The principal focus is on the development of sintered beta-LiAlO2 for electrolyte support and sintered Li sub x Ni sub 1-x O for cathodes. In the electrolyte development effort, both alpha- and beta-LiAlO2 were synthesized as starting material for sintered electrolyte supports, and tape casting was studied for preparing green bodies for intering. A sintering procedure was developed which produces flat NiO cathodes with good conductivity and pore structure. T.M.

EVALUATION OF GASIFICATION AND GAS-CLEANUP PROCESSES FOR USE IN MOLTEN-CARBONATE FUEL-CELL POWER PLANTS Quarterly Technical Progress Report

Gary Jablonski (Davy-McKee), M. A. Alvin, R. A. Wenglarz, and P. Patel 16 Jul. 1981 24 p refs

(Contract DE-AC21-81MC-16220)

(DE82-003207; DOE/MC-16220/T1; QTPR-1) Avail: NTIS HC A02/MF A01

A draft of the gasifier listing, a low temperature gas cleanup system listing and data acquisition for the hot gas cleaning systems listing were completed. Iron oxide, dolomite, zinc oxide, molten carbonate and other such systems were included in that listing. The molten carbonate fuel cell (MCFC) contaminant data available in the open literature are reported. Particulate and chemical species for assessing the effect of contaminants on MCFC operating characteristics are thermodynamically evaluated. Data and process insights, indispensable to the evaluation of suitable coal gas supply systems for molten carbonate fuel cell power plants are provided. DOE

A tool is presented to quantify the risks of geothermal projects, the Geothermal Probabilistic Cost Model (GPCM). The GPCM model was used to evaluate a geothermal reservoir for a binary-cycle electric plant at Heber, California. Three institutional aspects of the geothermal risk which can shift the risk among different agents was analyzed. The leasing of geothermal land, contracting between the producer and the user of the geothermal heat, and insurance against faulty performance were examined. DOE

HEBER GEOTHERMAL BINARY DEMONSTRATION PROJECT Quarterly Technical Progress Report, 1 Apr. - 30 Jun. 1981

G. D. VanDeMark Sep. 1981 32 p Sponsored in part by Electric Power Research Inst., Imperial Irrigation District, Calif. Dept. of Water Resources, and Southern Calif. Edison Co.

(Contract DE-FC03-80RA-50239)

(DE82-002462; DOE/RA-50239/T1) Avail: NTIS HC A03/MF A01

Work completed on the nominal 65 Megawatt (Mwe gross) Heber geothermal binary demonstration project, located at Heber, California, is documented. Topics covered include progress made in the areas of wells, fluid production and injection systems, power plant design and construction, power plant demonstration, and data acquisition and dissemination. DOE

06
ENERGY TRANSPORT, TRANSMISSION, AND DISTRIBUTION

Includes transport of fuels by pipelines, tubes, etc., microwave power transmission, and superconducting power transmission.

A82-20640 * **Microwave power - An energy transmission alternative for the year 2000.** E. Nalos and R. Sperber (Boeing Aerospace Co., Kent, WA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 48.1.1-48.1.5. 9 refs. Research supported by the U.S. Department of Energy; Contract No. NAS9-15636.

Recent technological advances related to the feasibility of efficient RF-dc rectification make it likely that by the year 2000 the transmission of power through space will have become a practical reality. Proposals have been made to power helicopters, aircraft, balloons, and rockets remotely. Other proposals consider the transfer of power from point to point on earth via relay through space or a transmission of power from large power sources in space. Attention has also been given to possibilities regarding the transmission of power between various points in the solar system. An outline is provided of the microwave power transmission system envisaged for the solar power satellite, taking into account the transmitting antenna, the receiver on earth, aspects of beam formation and control, transmitter options, the receiving antenna design, and cost and efficiency considerations. G.R.

A82-21975 **Equilibrium two-phase heat pipe flows with variable flowrate.** L. A. Vulis, I. G. Goriachko, and G. V. Zhizhin. (Krizisy teploobmena i okolokriticheskaia oblast', p. 112-117.) *Heat Transfer - Soviet Research*, vol. 12, Nov.-Dec. 1980, p. 120-126. Translation.

The problem of steady pipe flow of vapor in thermodynamic equilibrium with liquid droplets is analyzed as a part of a study of possible operating modes in a heat pipe. The analysis accounts for phase transitions within the flow core, with phase properties (e.g., velocity and temperature) averaged over the channel cross section. It is assumed that the supplied (or removed) heat is expended completely on phase transitions at the channel walls and that the mean phase velocities are equal, i.e., there is no slip. A set of equations are obtained which allow the calculation of flow parameters in any channel section. V.L.

A82-23944 **High power pulsed oscillators.** F. A. Myers (Plessey Research /Caswell/, Ltd., Allen Clark Research Centre, Towcester, Northants., England). In: Microwave solid state devices and applications. Stevenage, Herts., England, Peter Peregrinus, Ltd., 1980, p. 187-195. 9 refs.

Available pulsed sources are briefly reviewed including the TRAPATT device, the high-efficiency IMPATT, the Si avalanche device, the Si bipolar transistor, and the Gunn device. Pulsed Gunn oscillators are then discussed with reference to their operational parameters, advantages, and problems encountered. Design guidelines for a Gunn oscillator are presented. V.L.

MATERIALS RESEARCH FOR HYDROGEN-COOLED SUPERCONDUCTING POWER TRANSMISSION LINES
Quarterly Report, 1 Apr. - 30 Jun. 1981
A. M. Sietten, A. I. Braginski, M. Rosado, J. R. Gavaler, J. Greggi, J. Schreurs, R. H. Hammond, J. R. Kwo, M. Perez, J. Talvacchio et al. 1981 42 p refs Prepared in cooperation with Stanford Univ., Calif.
(Contract DE-AC02-89ET-29354)
(DE82-002171: DOE/ET-29354/T1: QR-7) Avail: NTIS HC A03/MF A01

Dielectric breakdown and loss measurements in liquid hydrogen and liquid hydrogen impregnated synthetic dielectrics are investigated at temperatures between 14 and 200K and at hydrostatic pressures up to five atmospheres. The effects of dissolved impurities/additives in the liquid are determined, and the self field and low field superconducting properties of high critical temperature materials at temperatures between approximately 14 and 200K are characterized. The construction of the dielectric test apparatus continued and the system of small electrodes was completed. Difficulties were encountered in the construction of the LH2 vessels and the junction box, which have retarded their completion. DOE

UTILITY AND TECHNOLOGY FOR A SPACE CENTRAL POWER STATION
Paul F. Holloway and L. Bernard Garrett *In its* Space Laser Power Transmission System Studies Feb. 1982 p 85-122 refs Presented at the Second AIAA Conf. on Large Space Platforms, Feb. 1981

Avail: NTIS HC A10/MF A01 CSCL 20E

The technological and economical impacts of a large central power station in Earth orbit on the performance and cost of future spacecraft and their orbital-transfer systems are examined.

It is shown that beaming power to remote users cannot be cost-effective if the central power station uses the same power generation system that would be readily available for provision of on-board power. Laser transmitters/receivers to make central power stations feasible are considered. The cost-effectiveness of meeting Earth-orbiting spacecraft electrical demands from a central power station was analyzed, indicating that this application cannot justify the investment required for the central station. Key technology needs which must be met to enable a viable central power station in the future are identified. N.W.

RAILWAY TRANSPORT OF LOW TEMPERATURE HEAT FROM LARGE POWER STATIONS BY MEANS OF ALTERNATIVE HEAT CARRIERS AND WATER Final Report

Gerardus Luchtman and Theo Bracke Bonn Bundesministerium fuer Forschung und Technology Nov. 1981 165 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technology

(BMFT-FB-T-81-145; ISSN-0340-7608) Avail: NTIS HC A08/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 32.60

The feasibility of railway transport of liquid and solid heat carriers in tank cars so as to replace pipeline transport of small to medium large heat loads was investigated. The typical characteristics of railway transport were analyzed and all essential technical and economical variables were integrated in a transport model. Over 1000 complex chemical compounds were evaluated for their suitability as heat carriers. Of these, three ammonia compounds are considered as promising. Considering, however, that complicated and expensive facilities are needed for heat transfer to and from ammonia, water is identified as the better choice. Results, based on 1975 transport prices, show that railway heat transport becomes competitive for heat loads above 50 to 100 MW and transport distances over 20 km Author (ESA)

ELECTROMAGNETIC COMPATIBILITY ANALYSIS FOR A SATELLITE POWER SYSTEM RECEIVING SITE IN THE MOJAVE DESERT

E. L. Morrison, W. B. Grant, and E. J. Lutton Jun. 1981 86 p refs Sponsored in part by DOE

(PB82-100710; NTIA/Rept-81-76) Avail: NTIS HC A05/MF A01 CSCL 10B

The Satellite Power System (SPS) as a source of baseline electrical power was evaluated. The SPS program develops an initial understanding of the technical feasibility, the economic practicality, and the social and environmental acceptability of the SPS concept. Electromagnetic compatibility (EMC) of an SPS with existing and planned electromagnetic and electronic systems is illustrated. A methodology is developed for rectenna site EMC analysis and impact evaluation. GRA

07
ENERGY STORAGE

Includes flywheels, heat storage, underground air storage, compressed air, storage batteries, and electric hybrid vehicles.

A82-19116 **Storing wind energy as a liquid fuel.** D. Miller (Haverford College, Haverford, PA). In: Wind Energy Workshop, 2nd, Cranfield, Beds., England, April 1980, Proceedings. London, Multi-Science Publishing Co., Ltd., 1980, p. 143-150. 12 refs.

A system which stores wind energy has been designed. Formic acid is synthesized in an electrolytic reactor using inexpensive catalysts. The vertical axis wind turbine has high solidity and fixed, straight blades. Its low aspect ratio contributes to a power coefficient of 0.43. Power is transmitted hydraulically, and the generator is a modified Faraday disk. The turbine operates at maximum power over the full range of wind speeds, because the area of the reactor electrodes is varied. Costs for equipment are presented, as well as a strategy for using wind energy stored as a liquid fuel. (Author)

A82-20749 * # **Synthetic battery cycling.** L. H. Thaller (NASA, Lewis Research Center, Cleveland, OH). *Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, Aug. 9-14, 1981, Paper.* 11 p.

The trend in energy storage is toward systems with high-voltage and high-power outputs. These conditions accentuate the cumulative effects of small differences in characteristics from cell to cell in any large multicell battery. These considerations are of particular concern with a number of emerging electrochemical concepts where convenient overcharge reactions do not exist. The use of interactive computer graphics is suggested as an aid in battery system development. Mathematical representations of simplistic but fully representative functions of many electrochemical concepts of current practical interest will permit battery-level charge and discharge phenomena to be analyzed in a qualitative manner prior to the assembly and testing of actual hardware. This technique will be a useful addition to the variety of tools available to the battery system designer as he bridges the gap between interesting single-cell life test data and reliable energy storage subsystems. (Author)

A82-23206 **Energy storage: A vital element in mankind's quest for survival and progress.** Edited by J. Silverman (Maryland, University, College Park, MD). Oxford, Pergamon Press, 1980. 595 p. $100.

Among the topics on the development status of energy storage technologies covered are (1) metal-air batteries, electric vehicle electrochemical energy storage, fuel cells and lithium/metal sulfide batteries; (2) aquifer thermal energy storage, metal hydride thermal energy storage, and thermochemical hydrogen production; (3) artificial photochemical solar energy storage, semiconductor-liquid junction solar cells, and photoredox processes; and (4) compressed air and flywheel mechanical energy storage. Consideration is also given to the modelling and assessment of the energy storage alternatives covered, in automotive and electric utility contexts. O.C.

A82-23777 **Thermodynamic studies of Li-Ge alloys - Application to negative electrodes for molten salt batteries.** M. R. Saint John, A. J. Furgala, and A. F. Sammells (Institute of Gas Technology, Chicago, IL). *Electrochemical Society, Journal*, vol. 129, Feb. 1982, p. 246-250. 33 refs.

A82-23778 * **Inexpensive cross-linked polymeric separators made from water-soluble polymers.** L.-C. Hsu and D. W. Sheibley (NASA, Lewis Research Center, Cleveland, OH). *Electrochemical Society, Journal*, vol. 129, Feb. 1982, p. 251-254.

Polyvinyl alcohol (PVA), cross-linked chemically with aldehyde reagents, produces membranes which demonstrate oxidation resistance, dimensional stability, low ionic resistivity (less than 0.8 Ohms sq cm), low zincate diffusivity (less than 1 x 10 to the -7th mols/sq cm per min), and low zinc dendrite penetration rate (greater than 350 min) which make them suitable for use as alkaline battery separators. They are intrinsically low in cost, and environmental health and safety problems associated with commercial production appear minimal. Preparation, property measurements, and cell test results in Ni/Zn and Ag/Zn cells are described and discussed. (Author)

A82-24236 **Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980.** Symposium sponsored by the Joint Services Electrical Power Sources Committee. Edited by J. Thompson (Royal Aircraft Establishment, Farnborough, Hants., England). London, Academic Press, 1981. 641 p. $128.

Topics discussed include improved lithium thionyl chloride cells using a new electrolyte, the reaction products of Li-SOCl2 cells, and glass-to-metal seal corrosion in lithium-sulfur dioxide cells. Papers are presented on the characteristics and applications of Li-MnO2 cells, on developments in solid state batteries, on the use of crown ethers in electrochemical cells, and on molten carbonate fuel cell improvements. Attention is also given to redox storage systems for solar applications, to the thermal management of batteries, to a review of recent developments in thermal batteries, and to the characteristics of large calcium-thionyl chloride cells. C.R.

A82-24240 * **Redox storage systems for solar applications.** N. H. Hagedorn and L. H. Thaller (NASA, Lewis Research Center, Cleveland, OH). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 227-242; Discussion, p. 242, 243. 5 refs.

It is noted that the worldwide development of solar photovoltaic and wind turbine systems to meet a range of terrestrial electrical energy requirements has underscored the need for inexpensive and reliable electrical energy storage. The NASA Redox Energy Storage System, based on soluble aqueous iron and chromium chloride redox couples, has exhibited many system-related features which for the most part are unique to this storage system. The technology advances required in the two elements (electrodes and membranes), which are the key to its technological feasibility, have been attained and system development has begun. The design, construction, and testing of a 1-kW system integrated with a solar photovoltaic array is underway to provide early demonstration of the attractive system-related features of the NASA Redox Storage System. Also demonstrated will be its versatility and compatibility with a terrestrial solar photovoltaic electric power system. C.R.

A82-24241 **Thermal management of batteries.** H. F. Gibbard and C.-C. Chen (Gould Laboratories, Rolling Meadows, IL). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 263-284. 15 refs. U.S. Department of Energy Contracts No. 31-109-38-4200; No. 31-109-38-5006.

Control of the internal temperature during high rate discharge or charge can be a major design problem for large, high energy density battery systems. A systematic approach to the thermal management of such systems is described for different load profiles based on: thermodynamic calculations of internal heat generation; calorimetric measurements of heat flux; analytical and finite difference calculations of the internal temperature distribution; appropriate system designs for heat removal and temperature control. Examples are presented of thermal studies on large lead-acid batteries for electrical utility load levelling and nickel-zinc and lithium-iron sulphide batteries for electric vehicle propulsion. (Author)

A82-24242 **A review of recent developments in thermal batteries.** A. Attewell (Royal Aircraft Establishment, Farnborough, Hants., England) and A. J. Clark (Mine Safety Appliances Co., Ltd., Glasgow, Scotland). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 285-302; Discussion, p. 302, 303. 25 refs.

It is noted that 'thermal battery' is a term applied to a class of reserve-type molten salt electrolyte primary cell systems that are inert until brought into use by the ignition of a charge of

pyrotechnic. Thereafter, the battery remains active for as long as one hour or for only a few seconds, depending on its size, thermal insulation, and electrochemical system and on the ambient temperature and the rate at which power is withdrawn. It is noted that systems using calcium or magnesium as anodes, though inefficient, have been brought to an advanced design and are widely used in weapons systems. The introduction of lithium as an anode material has improved efficiencies and widened performance limits. C.R.

A82-24243 A nickel oxide-iron battery developed for traction purposes - Advantages and limitations. B. Andersson, L. Ojefors (Swedish National Development Co., Akersberga, Sweden), and R. Hudson (Eagle-Picher Industries, Inc., Joplin, MO). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 379-387; Discussion, p. 387, 388. 5 refs. U.S. Department of Energy Contract No. 31-109-38-4292.

The nickel oxide-iron battery described here has successfully proved to be a good candidate for EV battery applications. Based on iron electrode technology and experience of nickel oxide electrodes development work started in May 1978. During the first stage individual cell components were studied, separator systems evaluated and a preliminary cell designed. During the second stage the main work was carried out with 300 A h cells which made it possible to study the important parameters under realistic conditions. The battery design is based on these cell tests. Full scale batteries will be built and tested in electric vehicles during 1980-81. (Author)

A82-24244 A comparison of a low pressure and a high pressure Ni-H2 cell. T. L. Markin, R. Bennett, N. J. Bridger, and R. M. Dell (Atomic Energy Research Establishment, Harwell, Oxon, England). In: Power sources 8: Research and development in non-mecnanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 445-456; Discussion, p. 456, 457.

A low-pressure Ni-H2 cell employing LaNi5 hydrogen storage negative electrodes is described. The charge and discharge characteristics of a low-pressure Ni-H2-10-A h cell are compared with those of a high-pressure Ni-H2 10-A h cell employing Pt-H2 negative electrodes. The characteristics of the low-pressure cell are found to be better than those of the high-pressure Ni-H2 cell at temperatures between 50 C and -20 C but inferior at -40 C. The maximum power at OCV/2 for one minute is found to be better for the low-pressure cell than for the high-pressure Ni-H2 cell at 20 C, but the two are similar at low temperatures. For both cells, self-discharge rates are similar, becoming rapid at 50 C. C.R.

A82-24245 Recent improvements in aircraft Ni-Cd cells. R. Bonnaterre, J. Leonardi, and P. Oliva (Société des Accumulateurs Fixes et de Traction, Bordeaux, France). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 459-468; Discussion, p. 469.

It is noted that the reliability, power performance, and durability of the alkaline Ni-Cd batteries used in such advanced technical fields as aeronautics and high-speed trains are becoming increasingly important. A new aircraft battery generation created to respond to such requirements is described. Increased reliability and durability result from the development and use of a new graft copolymer membrane, the properties of which are discussed. The use of the new membrane and the optimization of the electromechanical parameters of the cell design have significantly improved the power characteristics of Ni-Cd aircraft batteries. In particular, eliminating the 'potential well' phenomenon in low-temperature, high-rate discharges has led to substantial power gains for low-temperature aircraft starts. C.R.

A82-24246 Development of a sealed Ni-Cd cell capable of operating in unprecedented high temperature environments. M. Oshitani, M. Yamane, and S. Hattori (Yuasa Battery Co., Ltd., Osaka, Japan). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 471-487; Discussion, p. 485, 488.

A sealed Ni-Cd cell suitable for use at high temperatures has been developed. Addition of Cd(OH)2 and/or Co(OH)2 in the positive electrode improved charge acceptance at high temperatures, but Co(OH)2 lowered the discharge voltage. Addition of both together gave the best results. Alkali cations, especially Li(+), in the electrolyte improved the charge acceptance. However, a drastic capacity loss occurred in the negative electrode with LiOH solution due to accumulation of Li(+) in the positive electrode. Mixture with other solutions is inevitable. Even at high temperature gamma-Cd(OH)2 was formed when Na(+) was present, while beta-Cd(OH)2 was formed in the other cases. (Author)

A82-24248 A sealed rechargeable metal-oxygen battery for traction purposes. M. Bursell (Kungl. Tekniska Hogskolan, Stockholm, Sweden). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 513-521. Research supported by the Styrelsen for Teknisk Utveckling.

A prototype of a sealed, rechargeable iron-oxygen battery that is based on a new oxygen electrode design is described, noting that the electrode design has made it possible to considerably simplify construction. It is pointed out that the oxygen electrode can be described as a self-breathing oxygen pocket electrode. It reaches 2 cm above the electrolyte in the battery and is fed with oxygen at the top of the battery by virtue of the pressure difference between the top of the electrode and the bottom. C.R.

A82-24292 Molten nitrate salt technology development. R. W. Carling (Sandia National Laboratory, Livermore, CA). *National Association of Corrosion Engineers, International Corrosion Forum, Toronto, Canada, Apr. 6-10, 1981, Paper.* 7 p. 5 refs.

This paper presents an overview of the experimental programs underway in support of the Thermal Energy Storage for Solar Thermal Applications (TESSTA) program. The experimental programs are concentrating on molten nitrate salts which have been proposed as heat transfer and energy storage medium. The salt composition of greatest interest is drawsalt, nominally a 50-50 molar mixture of NaNO3 and KNO3 with a melting point of 220 C. Several technical uncertainties have been identified that must be resolved before nitrate based solar plants can be commercialized. Research programs at Sandia National Laboratories, universities, and industrial suppliers have been implemented to resolve these technical uncertainties. The experimental programs involve corrosion, decomposition, physical properties, and environmental cracking. Summaries of each project and how they impact central receiver applications such as the repowering/industrial retrofit and cogeneration program are presented. (Author)

A82-25365 † Materials for flywheel energy storage systems (Materialy dlia inertsionnykh nakopitelei energii). I. A. Glebov, E. G. Kasharskii, N. N. Kustov, F. G. Rutberg, A. M. Shkatova, and G. M. Khutoretskii. *Akademiia Nauk SSSR, Izvestiia, Energetika i Transport,* Jan.-Feb. 1982, p. 32-37. 14 refs. In Russian.

The paper examines the choice of materials for flywheels to be used as storage units in electrical machinery systems. Particular consideration is given to two extremal problems of flywheel design: assurance of maximum specific energy content (i.e., energy content for unit weight), and assurance of maximum total energy capacity. As an example, attention is given to the fabrication of forged flywheels from the 25KhNZMFA and 35KhNZMFA steels. B.J.

A82-25506 Storage of low temperature heat by thermochemical reactions (Le stockage de la chaleur à basse température par réactions thermochimiques). R. Sizmann, D. Jung, and N. Khelifa (München, Universität, Munich, West Germany). *Coopération Méditerranéenne pour l'Energie Solaire, Revue Internationale d'Héliotechnique,* 2nd Semester, 1981, p. 42-51. 15 refs. In French.

Storage of low temperature solar generated heat by means of thermochemical reactions is reviewed as a method for compensating for diurnal and climatological variations in the solar input. The method is modeled as a separation of two exothermically joined chemicals by the addition of 30-150 C heat. The chemicals can then

be reexposed to one another to release the stored thermal energy on demand. Reactions which result in a liquid and a vapor phase are noted to have the highest thermodynamic efficiency. The hydration of NaS2 necessitates the use of a closed loop system, while a silica gel, which can store up to 400 kWht, ideally, and 200 kWh/cu m in practice, is made from environmentally neutral materials. Details of the silica gel/water vapor storage system are explored, showing an adsorption capacity which makes the material suitable for industrial applications. M.S.K.

ALTERNATIVES TO CERAMIC BRICKS AND CERAMIC-BRICK SYSTEMS
J. Michael MacDonald 1981 10 p refs Presented at the Thermal and Chem. Storage Ann. Rev. Meeting, Washington, D.C., 14-16 Sep. 1981
(Contract W-7405-eng-26)
(DE81-032029; CONF-810940-4) Avail: NTIS HC A02/MF A01

Alternative materials for use as thermal energy storage media in electric storage furnaces were evaluated and selected. Selections were based on low cost, availability, durability, and energy storage density. The materials selected were taconite pellets, river gravel, crushed stone, and crushed (air cooled) blast furnace slag. Essential material properties and energy storage densities were established. A conceptual design for an electric storage furnace using these low cost materials was developed. The performance of this conceptual furnace was characterized by an analytical model and a computer code for the model developed. Performance and design comparisons between present day furnaces and the prototype furnace were made. A significant cost advantage for the proposed furnace over existing electric storage furnaces cannot be established. DOE

DESIGN AND COST ANALYSIS OF A 20-kWh BIPOLAR ZINC-BROMINE BATTERY
Harry Einstein, Richard V. Bellows, Patrick Grimes, Edward Kantner, Paul Malachesky, and Kenneth Newby 1981 4 p refs Presented at 6th Elec. Vehicle Council Symp., Baltimore, 21 Oct. 1981
(Contract DE-AC04-76DP-00789)
(DE81-030117; SAND-81-7147C; CONF-811010-4) Avail: NTIS HC A02/MF A01

Exxon's approach to the system uses conductive carbon plastic electrodes in a bipolar configuration, separable bromine complexes, and selective membranes in a circulating electrolyte design. The battery design consists of two kWh battery stacks placed back-to-back with a common center electrolyte feed block. Each of the two battery stacks consists of 78 cells for a system voltage of 120 volt output. Active electrode area per electrode is 12 sq dm cell-to-cell spacing is 0.25 cm. The two-stack module is assembled over a tray serving as a cover for the plastic electrolyte reservoir. Unit cells are comprised of alternating bipolar electrodes and separator assemblies. The projected battery factor price is discussed, along with the manufacturing, materials, and labor costs. T.M.

HEAT STORAGE WITH AN INCONGRUENTLY MELTING SALT HYDRATE AS STORAGE MEDIUM BASED ON THE EXTRA WATER PRINCIPLE
Simon Furbo Dec. 1980 17 p refs
(DE82-901186; DTH-LV-MEDD-108; Rept-8) Avail: NTIS (US Sales Only) HC A02/MF A01; DOE Depository Libraries

The extra water principle, a heat of fusion storage method, is described. The extra water principle uses an inorganic, incongruently melting salt hydrate as a reliable and stable storage medium in an inexpensive way. Different heat storages using the extra water principle are described. The advantages of using a heat fusion storage unit based on Na2S2O(3).5H2O and the extra water principle instead of a traditional hot water tank in small solar heating systems for domestic hot water supply are shown. In small solar heating systems the heat fusion storage supplies all the wanted hot water in the summer during longer periods than an ordinary hot water storage. It is concluded that the heat of fusion storage is favorable in domestic hot water supply systems with an auxiliary energy source which during the summer have a large energy consumption compared with the energy demands for the hot water supply. ELECTROCHEMICAL ENERGY STORAGE FOR AN ORBITING SPACE STATION
R. E. Martin Dec. 1981 61 p refs
(Contract NAS3-21293)
(NASA-CR-165436; FCR-3142) Avail: NTIS HC A04/MF A01 CSCL 10C

The system weight of a multi hundred kilowatt fuel cell electrolysis cell energy storage system based upon alkaline electrochemical cell technology for use in a future orbiting space station in low Earth orbit (LEO) was studied. Preliminary system conceptual design, fuel cell module performance characteristics, subsystem and system weights, and overall system efficiency are identified. The impact of fuel cell module operating temperature and efficiency upon energy storage system weight is investigated. The weight of an advanced technology system featuring high strength filament wound reactant tanks and a fuel cell module employing lightweight graphite electrolyte reservoir plates is defined. Vehicle/battery performance capabilities and interface problems that occurred when upgraded developmental batteries were integrated with upgraded versions of commercially available electric vehicles were investigated. Developmental batteries used included nickel zinc batteries, a nickel iron battery, and an improved lead acid battery. Testing of the electric vehicles and upgraded batteries was performed in the complete vehicle system environment to characterize performance and identify problems unique to the vehicle/battery system. Constant speed tests and driving schedule range tests were performed on a chassis dynamometer. The results from these tests of the upgraded batteries and vehicles were compared to performance capabilities for the same vehicles equipped with standard batteries. S.L.

GPS ON-ORBIT BATTERY PERFORMANCE
John L. Kasten *In* NASA. Goddard Space Flight Center The 1981 GSFC Battery Workshop Mar. 1982 p 341-352

Avail: NTIS HC A23/MF A01 CSCL 10C

Three batteries designed for the GPS system were evaluated. The batteries were wired together, and during the eclipse period were discharged through parallel diodes into a boost converter which then boosted the battery voltage up to the totally regulated bus voltage. Each battery, with a system life of approximately five years, had its own charger. During testing the battery was maintained or used on trickle charge. Data are presented for the battery capacity during the reconditioning. Raw data for each eclipse period and calculations for the average discharge voltage for each battery are given. Thermal cycling for one of the batteries and reconditioning cycles and regimes for all of the batteries are discussed. A reconditioning discharge curve is also given. The problem of temperature cycling in one of the batteries was resolved by redesigning the battery radiator system. M.D.K.

EFFECTS OF THE MODE OF STORAGE ON THE CAPACITY FADING OF THE SINTERED NICKEL ELECTRODES
B. Vyes and M. P. Bernhardt *In* NASA. Goddard Space Flight Center The 1981 GSFC Battery Workshop Mar. 1982 p 367-386

Avail: NTIS HC A23/MF A01 CSCL 10C

A systematic investigation of the effect of temperature and two conditions of storage, shortened and open circuit, on the capacity fading of sintered nickel electrodes in NiCd batteries was conducted. All testing was done on sintered electrodes in flooded cells. Cycling tests to measure the capacity were performed at room temperature. The capacity out to one volt, a capacity useful for satellite applications. Test results indicated that: the shortened electrode showed a higher rate of loss than the open circuit electrodes; there was an increase in both modes with an increase in temperature; there was a loss of capacity with time of storage; a general degradation was observed as a function of time; shortened electrodes showed a higher end of charge than the open circuit ones; and at room temperature there was a lower loss in the open circuit electrode than in the shortened one. M.D.K.

COMPARISONS OF DIFFERENT PLATE TREATMENTS AND DESIGNS: ANALYSIS
Vasanth Kunigahelli *In* NASA. Goddard Space Flight Center The 1981 GSFC Battery Workshop Mar. 1982 p 443-458

Avail: NTIS HC A23/MF A01 CSCL 10C

The design and process changes on cell performance and life were studied. The merits of each design were analyzed physically, chemically, and electrochemically. A teardown analysis of each cell was carried out. On opening the cell it was found that the cell pack was moist with the electrolyte, the extent varying from one cell to another. The cell components, the positives, the negatives, and the separators, could be separated easily for cell pack of an uncycled cell. The separators from the uncycled cell were clean and white. In the case of cycled cells the separators were stuck to the surface of the negative plates. During the removal of these separators from the negative plates invariably a thin layer of the separator material was strongly adhering to the surface of the negative plates and could not be removed as easily as in the case of the uncycled cells. The separators had dark patches due to cadmium migration. N.W.

SOME PROPERTIES OF NiH2 CELLS
Howard H. Rogers *In* NASA. Goddard Space Flight Center The 1981 GSFC Battery Workshop Mar. 1982 p 513-524

Avail: NTIS HC A23/MF A01 CSCL 10C

Different tests on a flight type cell are discussed. The temperature was measured at the cell flange. The cell was charged to rollover at .75 C rate at 40 degrees C for the first temperature. At that point a voltage reading was taken. Charging was done for an arbitrary ten seconds at .75 C, 30 C, 20 C, 10 C and zero C to obtain momentarily stable voltages. N.W.

USE OF NON-SEQUENTIAL TECHNIQUES IN THE ANALYSIS OF POWER POTENTIAL AT STORAGE PROJECTS
Gary M. Franc Jun. 1981 19 p refs Presented at the Waterpower 81st Conf., Washington, D.C., Jun. 1981
(AD-A109788; HEC-TP-80) Avail: NTIS HC A02/MF A01 CSCL 10/2

An electronic computer procedure is described that uses an estimate of power storage available at a dam site to make estimates of average annual energy and dependable capacity using a non-sequential methodology. Comparisons of this method against the more traditional sequential routing analysis are performed. Author (GRA)

TECHNICAL AND ECONOMIC ASSESSMENT OF FLUIDIZED-BED-AUGMENTED COMPRESSED AIR ENERGY-STORAGE SYSTEM. VOLUME 3: PRECONCEPTUAL DESIGN
A. J. Giramonti, R. D. Lessard, D. Merrick (Coal Processing Consultants Ltd.), and M. J. Hobson (Acres American Inc.) Sep. 1981 251 p refs Prepared for Pacific Northwest Lab.
(Contract DE-AC06-77RL-01830)
(DE82-001945; PNL-3686-Vol-3) Avail: NTIS HC A12/MF A01

A technical and economic assessment of fluidized bed combustion augmented compressed effort are presented in three volumes. Volume III - Preconceptual Design contains the system analysis which led to the identification of a preferred component configuration for a fluidized bed combustion augmented compressed air energy storage system, the results of the effort which transformed the preferred configuration into preconceptual power plant design, and an introductory evaluation of the performance of the power plant system during part-load operation and while load following. RPE-10 COMPOSITE FLYWHEEL TESTING Final Report
B. R. Ginsburg Livermore, Calif. California Univ. Lawrence Livermore Lab. 15 Jun. 1981 47 p refs
(Contract W-7405-eng-48)
(DE82-001694; UCRL-15379) Avail: NTIS HC A03/MF A01

The final report on the technical effort to test an RPE-10 composite flywheel is described. The RPE-10 composite flywheel was designed and fabricated for vehicle use under a Sandia Laboratories contract. The flywheel (Unit No. 2) was tested to a speed of 21,600 rpm, at which time the overwrap separated from the flywheel, terminating the test. The primary cause of failure was attributed to overheating in the test cell, causing a deterioration in material properties of the epoxy bond. The RPE-10 composite flywheel Unit No. 1 was successfully tested without failure to 24,120 rmp at Oak Ridge's Y-12 Laboratory. At this speed, the rotor stored over 2.0 kilowatt hours of kinetic energy. DOE

PRELIMINARY ENGINEERING DESIGN AND COST OF ADVANCED COMPRESSED-AIR STORAGE (ACAS) A-5 HYBRID Final Report
E. J. Sosnowicz, J. Blackman (Brown Boveri Corp., North Brunswick, N.J.), A. S. Woodhull, and P. Zaugg Aug. 1981 272 p refs
(EPRI Proj. 1699-1)
(DE82-900339; EPRI-EM-1998) Avail: NTIS HC A12/MF A01

The advanced compressed air energy (ACAS) plant investigated operates on a partial adiabatic, partial fuel fired cycle. Only a limited advancement in state-of-the-art technology is projected for this hybrid arrangement. The A-5 hybrid systems stores the heat of compression from the low pressure and intermediate pressure compressors in a thermal energy store (TES). The heat collected in the TES is available for preheating the air from the storage cavern prior to its entering the low pressure turbine combustor. This reduces the amount of fuel consumed during power generation. The fuel heat rate for the hybrid cycle is 2660 Btu/kWh as compared to approximately 4000 Btu/kWh for a conventional CAES plant. A virtual stand-off between the hybrid plant and a conventional CAES plant at 235 mills/kWh in 1980 dollars is shown. With a lower cost and increased fuel cost projections, the hybrid system operating cost is less than that for a conventional CAES plant. T.M.

HEAT STORAGE BY MEANS OF THERMAL DISSOCIATION REACTIONS. STORAGE SYSTEMS AND MATERIALS [WAERMESPEICHERUNG DURCH THERMISCHE DISSOZIATIONSREAKTIONEN - SPEICHERSYSTEME UND SPEICHERMATERIALEN]
A. Nonnenmacher May 1980 50 p refs In GERMAN; ENGLISH summary
(IKE-5-213; ISSN-0173-6892) Avail: NTIS HC A03/MF A01

The reversible chemical reactions used for heat storage are classified, according to the phase of the dissociation products and storage techniques, pertaining to the respective phases. The physical principles of heat storage, the relevant thermal dissociation reactions and adsorption cycles are reviewed and the most important working media for the different reaction groups are summarized. The interaction with the storage materials is investigated and reactions of gases and fluids with solids and liquids are emphasized. Storage by adsorption media is also envisaged. Author (ESA)

ENERGY STORAGE: A SHORT LIST OF INTERESTED PARTIES, 1981 AND THE STORAGE OF ENERGY; A WALL CHART
F. M. Russell 1981 29 p refs
(PB82-132069; RL-81-067) Copyright Avail: NTIS HC A03/MF A01 CSCL 10C

The storage of energy is an important feature of all industrialized activity and is increasing in importance rapidly as attempts are made to conserve energy and to use energy more efficiently in both industrial and domestic applications. In April 1981 an International Conference on Energy Storage was co-sponsored by SERC, BHRA and ETSU. As part of the SERC contribution to that conference an analysis was made of the activities and interests of the conference participants relevant to energy storage. This short list of parties interested in energy storage was made available to conference delegates but it is believed that a wider distribution of this information may be of use to others who may be either currently active or contemplating initiating work in this area. GENERAL

A82-20876 **Space in the 1980's and beyond; Proceedings of the Seventeenth European Space Symposium, London, England, June 4-6, 1980.** Symposium sponsored by the Association Aéronautique et Astronautique de France, Deutsche Gesellschaft für Luft- und Raumfahrt, American Astronautical Society, et al. Edited by P. M. Bainum (Howard University, Washington, DC). San Diego, CA, American Astronautical Society (Science and Technology Series. Volume 53); Univelt, Inc., 1981. 302 p. $40.

Topics discussed include a long-term space program for Europe, space communications, space transportation, applications, and technology, and lunar and planetary exploration. Papers are presented on manufacturing in space, on the contributions of space reflector technology to food production, local weather manipulation, and energy supply, and on a technological approach towards future large solar arrays. Attention is also given to low-pressure greenhouses and plants for a manned research station on Mars, to the extraction of Martian resources for a manned research station, and to the development of future lunar exploration. C.R.

A82-28112 **AIP 50th anniversary: Physics vade mecum.** Edited by H. L. Anderson (Los Alamos National Laboratory, Los Alamos, NM). New York, American Institute of Physics, 1981. 335 p.

This compendium is intended to be of use to the wide spectrum of physicists associated with the AIP through its member societies. Twenty-two subjects broadly representative of physics as a whole are discussed. Each subeditor was charged to compile within 10 pages the most useful information, formulas, numerical data, definitions, and references most physicists would like to have at hand. The General Section is a compilation of the fundamental constants, the SI units and prefixes, conversion factors, magnitudes, basic mathematical and physics formulas, formulas useful in practical physics applications, and a list of physics data centers. The particular fields considered are: acoustics, astronomy and astrophysics, atomic collision properties, atomic spectroscopy, biological physics, cryogenics, crystallography, elementary particles, energy demand, energy supply, fluid dynamics, high polymer physics, medical physics, molecular spectroscopy and structure, nuclear physics, optics, plasma physics, rheology, solid state physics, surface physics, and thermophysics. INVESTIGATION OF THE USE OF COAL REFUSE-FLY ASH COMPOSITIONS AS HIGHWAY BASE COURSE MATERIAL Final Report, Oct. 1977 - Sep. 1980
Paul V. McQuade, W. J. Head, and Robert B. Anderson Jun. 1981 68 p Prepared in cooperation with West Virginia Univ., Morgantown
(Contract DOT-FH-11-9324)
(PB82-101940; FHWA/RD-80/129; Rept-77-522) Avail: NTIS HC A04/MF A01 CSCL 13C

The utilization of coal refuse-fly ash compositions as highway base course material is surveyed. The results of a laboratory testing program into the physical and engineering properties of mixtures of these waste products are presented. A comparison of serviceability index and physical damage parameters based on the VESYS Predictive Design Procedure between crushed stone and coal refuse-fly ash compositions are presented. These findings indicate that substituting stabilized coal refuse-fly ash blends in place of conventional base course material is technically and economically feasible. Procedures for developing design mixes and conducting field tests of coal refuse-fly ash base course material are described. Author

THE DEVELOPMENT OF PVC-MODIFIED TARS FOR USE IN SURFACE TREATMENTS
I. L. Jamieson 1981 75 p refs
(CSIR-RR-393; CSIR-B-14) Avail: NTIS HC A04/MF A01

An account of this research in improving the durability of tar is presented. It includes: the formulation of tars; the manufacture of tars and modified tars; the storage and handling of tars; the performance of PVC modified tars in surface treatments; road experiments and normal contract work. The development of improved tar binders which could be used as alternatives to petroleum bitumen, with considerable cost advantage to road authorities was considered. Practical points which have emerged from this research are included. Author

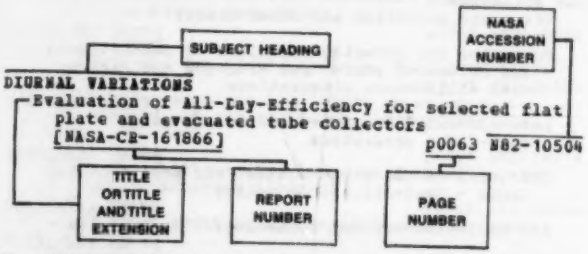
DIRECTORY OF ENERGY AND ENVIRONMENT LIBRARIES AND INFORMATION CENTERS IN THE METROPOLITAN WASHINGTON D.C. AREA
Ellen L. Berman 1981 162 p
(PB82-123993) Avail: NTIS HC A08/MF A01 CSCL 05B

Information on the resources, services, and policies of each library and information center is provided. The directory is arranged alphabetically by name of parent organization. Indexes to key staff members, subject coverage, types of material, and online search services are included. Terms in the subject index conform to the subject list in the questionnaire (Appendix A). The index to Types of Material draws its terms form a list in the RESOURCES section of the questionnaire. GRA

SUBJECT INDEX

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. The title, and title extension if used, provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any subject heading the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

p0220 A82-26334
International alcohol fuels
[GPO-78-681] p0186 N82-20328
Distilling alcohol with waste automobile heat
[DE82-000143] p0262 N82-21427
Small-scale fuel-alcohol plant. Volume 1: Design report
[DE82-001038] p0263 N82-21432
Alcohol fuels production, manpower, and education: Where do two-year colleges fit
[DE82-001929] p0263 N82-21436
ALGAE
Hydrocracking of the oils of Botryococcus braunii to transport fuels
[NRL-R-783] p0262 N82-21416
ALGORITHMS
Correlation and interferometric data analysis applied to gas chromatography Fourier transform infrared spectroscopy
p0249 N82-17286
DOE-2 verification project, phase 1
[LA-8295-MS] p0177 N82-17616
ALLOCATIONS
Analysis of state-energy-program capabilities
[DE82-001963] p0172 N82-16523
ALLOYS
Microstructural effects in abrasive wear
[DE82-003653] p0250 N82-17339
ALUMINUM
Al-air cells - Potential small electric generators for field use
p0272 A82-24249
ALUMINUM ALLOYS
The effect of degradation of glycols on corrosion of metals used in non-concentrating solar collectors
p0213 A82-24294
ALUMINUM COATINGS
Investigation of the natural-climatic aging of the reflective films of mirrors by an electrical method
p0217 A82-24871
ALUMINUM GALLIUM ARSENIDES
A new structure for high efficiency and humidity resistant AlGaAs/GaAs solar cells
p0193 A82-19893
Performance of 1 kWp AlGaAs/GaAs terrestrial concentrator solar cell array
p0193 A82-19894
The effect of the I sub 01/I sub 02 ratio on the open circuit voltage of solar cells
p0198 A82-21838
High efficiency large area AlGaAs/GaAs concentrator solar cells
p0211 A82-24221

200-W solar photoelectric system based on AlGaAs heterostructure solar cells and mirror concentrators
p0217 A82-24867

ALUMINUM OXIDES
Solar collector based on whisker-shaped oxides grown on metallic substrates
p0220 A82-26333

Advanced research and technology direct utilization: Recovery of minerals from coal fly ash. Fossil energy program
[DE82-003133]
p0261 N82-20698

AMMONIA
Hydrogen by water electrolysis as basis for small scale ammonia production - A comparison with hydrocarbon based technologies
p0240 A82-25779

Thermodynamic analysis of solar thermochemical energy absorption
p0219 A82-26024

AMORPHOUS MATERIALS
The development of amorphous silicon solar cells
p0202 A82-24122

Development of amorphous Si solar cells in Japan
p0202 A82-24123

AMORPHOUS SEMICONDUCTORS
Photovoltaic Science and Engineering Conference in Japan, 2nd, Tokyo, Japan, December 2-4, 1980, Proceedings
p0191 A82-19876

Invited - Recent progress in amorphous silicon research and photovoltaic applications in the U.S.A.
p0191 A82-19877

Properties of amorphous Si:F:H film and its photovoltaic characteristics
p0194 A82-19903

Characteristics of Schottky barrier diodes in reactively sputtered amorphous Si:H
p0194 A82-19912

A new integrated type amorphous Si solar cell
p0194 A82-19913

Optimizations of the film deposition parameters for the hydrogenated amorphous silicon solar cell
p0194 A82-19914

Some properties of dc glow discharge amorphous silicon solar cells
p0196 A82-20463

Post-hydrogenation of CVD amorphous silicon - A promising preparation process for solar cells
p0203 A82-24124

Properties of fluorinated amorphous silicon solar cells
p0203 A82-24125

Electrical properties of hydrogenated amorphous Si/1-x/Ge/x/ alloys
p0210 A82-24197

Amorphous Si/1-x/Ge/x/ for high performance solar cell
p0210 A82-24198

Application of amorphous silicon nitride for MIS/inversion layer solar cells
p0210 A82-24203

Amorphous silicon p-i-n solar cells fabricated by reactive sputtering
p0220 A82-26807

Effect of phosphorous and boron impurities on amorphous silicon solar cells
p0220 A82-27010

Band tail recombination limit to the output voltage of amorphous silicon solar cells
p0220 A82-27012

ANAEROBES
Hydrogen production by immobilized cells. I - Light dependent dissimilation of organic substances by Rhodopseudomonas palustris
p0240 A82-25778

Temperature effects on the kinetics of the anaerobic digestion of crop residues to methane
p0244 A82-28391

ANALOG SIMULATION
Performance characteristics of open-cycle linearly-diverging diagonal type single- and multiple-load generators
p0269 A82-19297

ANEMOMETERS
Special purpose anemometry for wind power studies
p0241 A82-19120

ANISOTROPIC MEDIA
A new look at the discrete ordinate method for radiative transfer calculations in anisotropically scattering atmospheres. II - Intensity computations
p0217 A82-24940

ANNEALING
Schottky barrier solar cells of weakly hydrogenated CVD amorphous silicon
p0194 A82-19911

ANNUAL VARIATIONS
Assessment of seasonal-efficiency models for natural-gas-fired residential furnaces
[DE82-000499]
p0172 N82-16516

DOE-2 verification project, phase 1
[LA-8295-MS]
p0177 N82-17616

Meteorological evaluation of wind energy potential in the coastal belt of Pakistan
p0254 N82-17753

ANODES
Effects of the mode of storage on the capacity fading of the sintered nickel electrodes
p0293 N82-20431

ANODIZING
High efficiency MOS solar cells by anodic oxidation processes
p0193 A82-19891

ANTENNA DESIGN
Solid-state alternatives for the Solar Power Satellite
p0196 A82-20708

ANTIREFLECTION COATINGS
A new structure for high efficiency and humidity resistant AlGaAs/GaAs solar cells
p0193 A82-19893

Durability of porous silica antireflection coatings for solar collector cover plates
p0199 A82-23393

Porous silicon oxide anti-reflection coating for solar cells
p0219 A82-25741

Theoretical study of absorbed solar energy in multi-layer absorber coatings for receivers of solar concentrators. I - Radiation transfer analysis
p0221 A82-28387

APPLICATIONS PROGRAMS (COMPUTERS)
Modal characteristics of rotor blades: Finite element approach and measurement by ground vibration test
p0280 N82-18127

APPROPRIATIONS
Analysis of state-energy-program capabilities
[DE82-001963]
p0172 N82-16523

APPROXIMATION
An approximate theory of a rapidly rotating windmill
p0271 A82-23210

AQUEOUS SOLUTIONS
Inexpensive cross-linked polymeric separators made from water-soluble polymers --- for secondary alkaline nickel-zinc and silver-zinc cells
p0289 A82-23778

The effects of elevated temperature exposure on the compatibility of glycol solutions with metals used in solar absorbers
p0213 A82-24293

AQUIFERS
Solar energy storage and thermal use of an unconfined aquifer
p0191 A82-19448

Analysis of geopressured aquifers
[PB82-103862]
p0253 N82-17595

ARCHITECTURE
Passive-solar multi-family concepts
[DE82-000456]
p0222 N82-16499

The Class C Passive Performance Evaluation Program
[DE82-000454]
p0223 N82-16533

DOE-2 verification project, phase 1
[LA-8295-MS]
p0177 N82-17616

Performance of the Norris Cotton Federal Office Building for the first 3 years of operation
[PB82-105487]
p0182 N82-18728

FEDSOL: Program user's manual and economic optimization guide for solar Federal building projects
[PB82-107012]
p0228 N82-18729

Solar energy information user study: Military engineers
[DE82-001606]
p0233 N82-21720

Heating/daylighting prototype development, phase 1. Passive and hybrid solar manufactured building project covering research and component design
[DE82-002097] p0234 N82-21729
Center for Energy Research and Technological Resources for Puerto Rico
[DE81-031987] p0188 N82-21760

ARGENTINA
Transport and energy
[DE81-030287] p0175 N82-16946

ARTIFICIAL INTELLIGENCE
European Scientific Notes, volume 35, number 11
[AD-A109387] p0295 N82-20138

ASHES
Investigation of the use of coal refuse-fly ash compositions as highway base course material
[PB82-101940] p0295 N82-16301
Coal waste artificial reef program, phase 3. Volume 1: Summary report
[DE82-900854] p0187 N82-20699

ASPHALTENES
Reversibility of coal liquefaction
[DE81-027804] p0246 N82-16277

ASSESSMENTS
Environmental assessment, source test and evaluation report: Coal preparation plant no. 2
[PB82-103573] p0174 N82-16618
Environmental assessment, source test and evaluation report: Lurgi (Kosovo) medium-Btu gasification
[PB82-114075] p0183 N82-18751

ASSURANCE
Solar consumer assurance: An assessment of mechanisms in the northeast
[DE81-030052] p0223 N82-16538
Experience with modified aerospace reliability and quality assurance method for wind turbines
[NASA-TM-82803] p0281 N82-19550

ATMOSPHERIC BOUNDARY LAYER
Prospecting for wind energy - A field assessment of physical modelling
p0243 A82-26177

ATMOSPHERIC CIRCULATION
Possibilities for avoiding strong variations of the electrical output power of wind energy systems
p0278 N82-17625
Climatic influences of residential energy consumption
p0178 N82-17742

ATMOSPHERIC DIFFUSION
The Nanticoke shoreline diffusion experiment, June 1978. IV. A - Oxidation of sulphur dioxide in a power plant plume. B - Ambient concentrations and transport of sulphur dioxide, particulate sulphate and nitrate, and ozone
p0168 A82-26407

ATMOSPHERIC EFFECTS
Atmospheric corrosion model and monitor for low cost solar arrays
p0214 A82-24299

ATMOSPHERIC MODELS
Atmospheric corrosion model and monitor for low cost solar arrays
p0214 A82-24299
Modelling continuous fumigation of Nanticoke generating station plume
p0168 A82-26409
Energy and climate in South-East Asia and the Western Pacific
p0178 N82-17764

ATMOSPHERIC SCATTERING
A new look at the discrete ordinate method for radiative transfer calculations in anisotropically scattering atmospheres. II - Intensity computations
p0217 A82-24940

ATMOSPHERIC TURBULENCE
Turbulence statistics for design of wind turbine generators
[PB82-112939] p0283 N82-19792

ATTITUDE CONTROL
Variable gain for a wind turbine pitch control
[NASA-TM-82751] p0275 N82-16478

AUGMENTATION
Enhanced oil recovery by CO2 foam flooding
[DE82-000949] p0247 N82-16464

Measurement and correlation of conditions for entrapment and mobilization of residual oil
[DE82-001940] p0264 N82-21694

AUSTRALIA
Geological evolution and economic geology of the Berdekin River region, Queensland
[BMR-BULL-208] p0254 N82-17696

AUTOMATIC CONTROL
Automatic control of solar power plants
p0219 A82-25973
Potential economic benefits from process control of coal preparation plants
[DE82-000881] p0245 N82-16263
Solar energy control system --- temperature measurement
[NASA-CASE-NPS-25287-1] p0226 N82-18686
Longwall Guidance and Control Development
[NASA-TM-82455] p0257 N82-19637

AUTOMATIC FLIGHT CONTROL
Operational and performance aspects of fuel management in civil aircraft
p0164 A82-20518
Thrust management - Current achievements and future developments
p0164 A82-20520

AUTOMATIC TEST EQUIPMENT
Rapid characterization of solar cell performances
p0192 A82-19879
Natural sunlight accelerated weathering of photovoltaic modules
p0208 A82-24183

AUTOMOBILE ENGINES
Performance characteristics of automotive engines in the United States, third series, 1978 Buick 196 CID (3.2L), 2V
[PB81-236630] p0170 N82-16417
Advanced Gas Turbine (AGT) powertrain system initial development report
[NASA-CR-165130] p0275 N82-16485
Advanced Gas Turbine (AGT) powertrain system development for automotive applications
[NASA-CR-165175] p0276 N82-16937
Conventional engine technology. Volume 1: Status of OTTO cycle engine technology
[NASA-CR-168643] p0184 N82-19542
Conventional engine technology. Volume 3: Comparisons and future potential
[NASA-CR-168645] p0184 N82-19544
Cold-air performance of a 15.41-cm-tip-diameter axial-flow power turbine with variable-area stator designed for a 75-kW automotive gas turbine engine
[NASA-TM-82644] p0284 N82-21193
Preliminary results on performance testing of a turbocharged rotary combustion engine
[NASA-TM-82772] p0284 N82-21194
Experimental performance of the regenerator for the Chrysler upgraded automotive gas turbine engine
[NASA-TM-82671] p0284 N82-21712

AUTOMOBILE FUELS
The Daimler-Benz hydride vehicle project
p0240 A82-25780
Environmental assessment of the use of alcohol fuels in highway vehicles
[DE82-000887] p0170 N82-16259
Fuel economy and exhaust emissions of a methanol-fuel Chevette
[PB82-101783] p0173 N82-16595
Augmentation of research and analysis capabilities for timely support of automotive fuel economy activities
[PB81-247553] p0175 N82-16947
Development of adjustment factors for on road fuel economy
[PB81-241986] p0175 N82-16950
Evaluation of the Moleculetor Fuel Energizer under section 511 of the Motor Vehicle Information and Cost Savings Act
[PB81-247942] p0175 N82-16958
Evaluation of the impact on emissions and fuel economy of converting two vehicles to compressed natural gas fuel
[PB81-245714] p0176 N82-16959
Consumer orientations toward fuel efficient vehicles: Executive summary
[PB81-245359] p0176 N82-16965
Consumer orientations toward fuel efficient vehicles
[PB81-245367] p0176 N82-16966

Electric vehicle refuelling infrastructure
[EEG-038] p0179 N82-18073
Gasoline equivalent fuel economy determination for alternate automotive fuels
[PB82-120072] p0255 N82-18412
Conventional engine technology. Volume 1: Status of OTTO cycle engine technology
[NASA-CR-168643] p0184 N82-19542

AUTOMOBILES
High temperature durable catalyst development
p0270 A82-20739
The Daimler-Benz hydride vehicle project
p0240 A82-25780
Exhaust emissions from high-mileage catalyst-equipped passenger cars
[PB82-103326] p0173 N82-16586
Comparison of energy-storage devices for use in future automobiles
[DE81-026530] p0291 N82-16945
Consumer behavior towards fuel efficient vehicles, volume 2
[PB81-246654] p0175 N82-16948
Development of adjustment factors for on road fuel economy
[PB81-241986] p0175 N82-16950
Rolling resistance measurements 106 passenger car tires
[PB82-116625] p0176 N82-17512
Fuel economy and exhaust emissions characteristics of diesel vehicles: Test results of a prototype fiat 131TC 2.4 liter automobile
[NASA-CR-165535] p0179 N82-18068
Urban traffic signal control for fuel economy. Part 2: Extension to small cars
[AD-A109393] p0185 N82-20025
Consumer behavior towards fuel efficient vehicles. Volume 1: Executive summary
[PB82-103300] p0186 N82-20027
Distilling alcohol with waste automobile heat
[DE82-000143] p0262 N82-21427

AUTOROTATION
Dynamic and aeroelastic characteristics of complete windturbine systems
p0280 N82-18128

AUXILIARY POWER SOURCES
Navy position on lithium safety
p0292 N82-20414

AVAILABILITY
Crude sources and refining trends and their impact on future jet fuel properties
[SAE PAPER 811056] p0242 A82-24391
The wind characteristics program element
[DE82-004876] p0249 N82-16673

AVALANCHE DIODES
High power pulsed oscillators
p0287 A82-23944

AXES OF ROTATION
Results of continuous synchronous orbit testing of sealed nickel-cadmium cells
[NASA-CR-168564] p0292 N82-19678

AXIAL FLOW TURBINES
Theory and performance of a Wells turbine
p0272 A82-24021
Power generation from the East Australian current by use of arrays of submerged Darrieus vertical axis turbines
p0274 A82-26178
Exchange of national experience in the field of new energy sources: In particular, solar, wind, and geothermal energy: The 25 m experimental horizontal axis wind turbine (25 m HAT)
[PB81-235568] p0276 N82-16547
Influence of correlations and computational methods on the predictica of overall efficiency
p0276 N82-17180

B

BANDPASS FILTERS
Bandpass filters for thermophotovoltaic conversion systems
p0197 A82-21363

BATTERY CHARGERS
Design and system level performance of a battery charge regulator for solar photovoltaic powered aids to navigation
[PB82-106824] p0292 N82-17648
Electric vehicle refuelling infrastructure
[EEG-038] p0179 N82-18073
GPS on-orbit battery performance
p0293 N82-20429

BEAUFORT SEA (NORTH AMERICA)
Site investigations and submarine soil mechanics in polar regions
[AD-A108269] p0256 N82-18790

BEDS (PROCESS ENGINEERING)
Parametric performance studies on fluidized-bed heat exchangers
[DE82-002124] p0187 N82-20476

BELGIUM
National energy research and development program --- bibliography of belgian scientific and technical reports
p0182 N82-18707

BENEFICIATION
Heavy-liquid beneficiation of fine coal
[DE81-030965] p0261 N82-21279

BERYLLIUM
A large active area Be-Si HIS solar cell with textured surface
p0192 A82-19885

BERYLLIUM OXIDES
Effect of absorbed water on an indium oxide-insulator /BeO.SiO2/-p-silicon solar cell
p0198 A82-22190

BETA FACTOR
Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field
[AIAA PAPER 82-0396] p0270 A82-20292

BIBLIOGRAPHIES
National energy research and development program --- bibliography of belgian scientific and technical reports
p0182 N82-18707

BINDERS (MATERIALS)
Briquetting of fine coal using a sodium chloride binder
[DE82-000632] p0250 N82-17395

BIODEGRADATION
Environmental quality research-fate of toxic jet fuel components in aquatic systems
[AD-A109790] p0187 N82-20693

BIOLOGICAL EVOLUTION
Coupling to solar energy: Sensitized photoreactions - The primary source of self-organization
p0197 A82-20968

BIOMASS ENERGY PRODUCTION
Sea, soil, sky - Testing solar's limits
p0195 A82-20169
Biological sources of energy from the sea
p0241 A82-20256
Biomass options for the big island of Hawaii
p0167 A82-24690
Pacific Gas and Electric Company - Biomass energy activities
p0242 A82-24691
Biomass energy systems and the environment --- Book
p0169 A82-28000
A novel chlorophyll solar cell
p0221 A82-28386
Temperature effects on the kinetics of the anaerobic digestion of crop residues to methane
p0244 A82-28391
Assessment of the economic, technical, and environmental feasibility of developing, constructing, and operating a 25-million-gallon-per-year grain-ethanol-production facility. Volume 1: Executive summary
[DE82-000294] p0170 N82-16265
Assessment of the economic, technical, and environmental feasibility of developing, constructing, and operating a 25-million-gallon-per-year grain-ethanol-production facility. Volume 2: Technical analysis
[DE82-000479] p0170 N82-16266
Proceedings of the 4th International Symposium on Alcohol Fuels Technology, volume 1
[DE81-903753] p0245 N82-16273
Proceedings of the 4th International Symposium on Alcohol fuels Technology, volume 2
[DE81-903754] p0245 N82-16274
Small-scale fuel-alcohol plant. Volume 2: Detailed equipment information
[DE82-001037] p0246 N82-16278

Development of hydrocoaversion of biomass to synethetic fuels. Project 61042 technical report
[DE82-000874] p0248 N82-16529
Research and evaluation of biomass resources/conversion/utilization systems. Biomass allocation model. Volume 1: Text and appendices A & B
[DE82-000838] p0254 N82-17630
Research and evaluation of biomass resources/conversion/utilization systems. Biomass allocation model. Volume 2: Appendices C-E
[DE82-000839] p0254 N82-17631
Adaptation of the simplex gasification process to the coconversion of municipal solid waste and sewage sludge
[PB82-112418] p0254 N82-18406
Feasibility study on new processes for fuel from biomass
[DE82-002834] p0259 N82-20332
Feasibility study of the commercial production of ethanol from wood. Volume 2: Appendices 1-6
[DE82-002410] p0263 N82-21429
Feasibility study for alternate fuel production from biomass resources
[DE82-002616] p0263 N82-21430
Small-scale fuel-alcohol plant. Volume 1: Design report
[DE82-001038] p0263 N82-21432

BIONICS
Coupling to solar energy: Sensitized photoreactions - The primary source of self-organization
p0197 A82-20968

BIOSPHERE
Social and Environmental Consequences of Natural Resources Policies with Special Emphasis on Biosphere Reserves
[PB82-113937] p0185 N82-19660

BITUMENS
Flash hydropyrolysis of Western Kentucky no. 9 bituminous coal with catalyst
[DE81-029631] p0244 N82-16210
Rapid-rate bituminous coal gasification
[PB82-115478] p0251 N82-17404
BI in-situ oil-shale project
[DE82-002134] p0264 N82-21693

BLACK BODY RADIATION
Selective blacks for enhanced photothermal solar energy conversion
p0191 A82-19296

BLADES (CUTTERS)
LSA large area silicon sheet task enhanced ID slicing technology for silicon ingots
[NASA-CR-168668] p0231 N82-20651

BOILERS
Thermal analysis of a solar pond power plant operated with a direct contact boiler
[ASME PAPER 81-WA/SOL-15] p0215 A82-24614
The potential economic benefit of using parabolic trough collectors to supplement power cycle boilers
[ASME PAPER 81-WA/SOL-17] p0215 A82-24616
Potential for using parabolic trough collectors to supplement power cycle boilers
[SAND-81-0572C] p0222 N82-16505
Industrial steam supply system characteristics program. Phase 2: Low- and medium-Btu gas-fired boilers with associated gasification plants
[DE82-000535] p0248 N82-16517
MHD Heat and Seed Recovery Technology Project
[DE82-001608] p0276 N82-16900
Promotion of utilizing primary energy and reduction of emission with grate-equipped heat generators fired completely automatic with solid fuels
[BMFT-FB-T-81-222] p0250 N82-17391
Evaluation of alternatives in downhole steam generation
[DE82-001943] p0253 N82-17574
Report on the experiences with the gas compression heat pump system of the school and sports center at Altenkunstadt
[BMFT-FB-T-81-175] p0181 N82-18552
Coal: dRDF (Densified Refuse Derived Fuel) demonstration test in an industrial spreader stoker boiler. Use of coal: dRDF blends in stoker-fired boilers, volume 1
[PB82-100868] p0257 N82-19384
Coal: dRDF (Densified Refuse Derived Fuel) demonstration test in an industrial spreader stoker boiler. Use of coal: dRDF blends in stoker-fired boilers, appendices A, B, C and D, volume 2
[PB82-100876] p0257 N82-19385
Steam Rankine Solar Receiver, phase 2
[NASA-CR-168656] p0230 N82-20643

BORESIGHT ERROR
Duplication of radome aerodynamic heating using the Central Receiver Test Facility solar furnace
p0220 A82-26468

BORON
Effect of phosphorous and boron impurities on amorphous silicon solar cells
p0220 A82-27010

BOUNDARY LAYER EQUATIONS
Hydraulic models of flow in an MHD generator channel, based on the equations of a two-dimensional boundary layer
p0274 A82-25788

BRAYTON CYCLE
Solar-thermal electric - Focal point for the desert sun
p0195 A82-20167
Buffer thermal energy storage for an air Brayton solar engine
[NASA-CR-168657] p0230 N82-20642

BRINES
Design, construction, and initial operation of the ANL research
[DE82-001961] p0223 N82-16528

BRIQUETS
Briquetting of fine coal using a sodium chloride binder
[DE82-000632] p0250 N82-17395

BUMPY TORUSES
Fusion - From science to engineering
p0270 A82-20170

BURNERS
Industrial burner and process efficiency program
[PB82-115486] p0182 N82-18731

BY-PRODUCTS
A procedure for determining the resource utilization potential of coal ash
[AD-A109877] p0261 N82-21111

C

CADMIUM
Comparisons of different plate treatment and designs: An update
p0293 N82-20436
Comparisons of different plate treatments and designs: Analysis
p0293 N82-20437

CADMIUM SELENIDES
Improved efficiency of n-CdSe thin-film photoelectrodes by zinc surface treatment
p0196 A82-20464
A high efficiency single-crystal CdSe photoelectrochemical solar cell and an associated loss mechanism
p0196 A82-20722
Properties of CdSe-HIS solar cells
p0210 A82-24204

CADMIUM SULFIDES
Growth and evaluation of n-CdS/n-InP/p-InP heteroface solar cell
p0193 A82-19896
Photovoltaics - A question of efficiency
p0195 A82-20168
Sprayed cadmium sulphide solar cells
p0203 A82-24126
Cu2S-CdS sprayed solar cells
p0203 A82-24127
Evaporated CdS-Cu/x/S solar cells
p0203 A82-24128
Surface properties of Cu/2-x/S and its influence on the performance of frontwall Cu/2-x/S-CdS thin film solar cells
p0209 A82-24185

An EBIC study of the CdS-Cu2S photovoltaic cell --- crystallograph using scanning electron microscope in Electron Beam Induced Current mode p0209 A82-24186
Transparent, conductive layers of sprayed indium tin oxide in Backwall Cu2S-CdS cells p0209 A82-24187
CdZnS-Cu2S thin film solar cells p0209 A82-24189
Cu2S/Zn/x/Cd/1-x/S heterojunction solar cells formed on sprayed Zn/x/Cd/1-x/S films p0209 A82-24190
Heterojunction energy band lineups in Cd/1-x/Zn/x/S/Cu2S solar cells p0209 A82-24191
Integrated Cu/x/S-CdS thin film solar cell panels with higher output voltages p0209 A82-24192
Characterization of n-CdS/p-Si heterojunction solar cells p0211 A82-24210

CADMIUM TELLURIDES
High-efficiency electrodeposited cadmium telluride solar cells p0198 A82-21949
Evaluation of electrodeposited cadmium telluride solar cells p0210 A82-24205
Theoretical and experimental study of quantum and energy conversion efficiency in CdTe p-n junctions p0210 A82-24206
Preparation and properties of evaporated CdTe films compared with single crystal CdTe [DE82-000228] p0236 N82-22073

CALCIUM SILICATES
Calcium silicate cements for desulfurization of combustion gases [DE82-003245] p0260 N82-20696

CALIBRATING
Results of the 1981 NASA/JPL balloon flight solar cell calibration program [NASA-CR-168442] p0224 N82-17610

CALIFORNIA
Design calculation procedure for passive solar houses at Navy installations in warm California climates, volume 5 [AD-A108386] p0229 N82-19687

CAPACITANCE
Materials for flywheel energy storage systems p0290 A82-25365
Case-positive versus case-negative designs for low-rate lithium thionyl chloride cells p0292 N82-20407

CAPACITORS
Seminar: Energy conservation. Role of power capacitors: Concepts and Policy Issues [PB81-247967] p0170 N82-16359

CAPILLARY FLOW
Measurement and correlation of conditions for entrapment and mobilization of residual oil [DE82-001940] p0264 N82-21694

CARBIDES
Optical properties of solids for solar energy conversion [ISSN-0345-0058] p0233 N82-21715

CARBON
Progress in the growth and performance of RAD silicon sheets --- for solar cell manufacture p0206 A82-24152
Flash hydropyrolysis of Western Kentucky no. 9 bituminous coal with catalyst [DE81-029631] p0244 N82-16210

CARBON COMPOUNDS
Sulfur gas emissions from stored flue gas desulfurization solids [DE82-900859] p0173 N82-16568

CARBON CYCLE
Increase of atmospheric CO2 and possible climatic changes p0178 N82-17763

CARBON DIOXIDE
Enhanced oil recovery by CO2 foam flooding [DE82-000949] p0247 N82-16464
Development of mobility control methods to improve oil recovery by CO2 [DE82-001968] p0253 N82-17575
Target reservoirs for CO2 miscible flooding, task two. Summary of available reservoir and geological data. Volume 1: Permian basin geological and reservoir data. Part 2: ADAIR-San Andres through EUNICE [DE82-001348] p0253 N82-17576
Increase of atmospheric CO2 and possible climatic changes p0178 N82-17763
Role of C-CO2 in gasification of coal and char [DE81-027358] p0259 N82-20334

CARBON MONOXIDE
Investigations of the changes of coal structure occurring during gasification [DE82-002652] p0258 N82-20279
Exploratory study of coal-conversion chemistry [DE82-001104] p0258 N82-20281

CARBON MONOXIDE LASERS
Investigation of possibilities for solar-powered high-energy lasers in space p0226 N82-18581

CARBONACEOUS MATERIALS
Briquetting of fine coal using a sodium chloride binder [DE82-000632] p0250 N82-17395
Role of C-CO2 in gasification of coal and char [DE81-027358] p0259 N82-20334

CARBONACEOUS ROCKS
Effects of porosity type, pore geometry, and diagenetic history on tertiary recovery of petroleum from carbonate reservoirs [DE82-000896] p0247 N82-16465
Target reservoirs for CO2 miscible flooding, task two. Summary of available reservoir and geological data. Volume 1: Permian basin geological and reservoir data. Part 2: ADAIR-San Andres through EUNICE [DE82-001348] p0253 N82-17576

CARBONATES
Molten carbonate fuel cell improvements p0272 A82-24239
Engineering development of molten carbonate fuel cell power plants p0273 A82-24694
Advanced fuel-cell development [DE82-003007] p0285 N82-21722

CARBONYL COMPOUNDS
Supported metal carbonyls: New catalysts for liquefaction of coal [DE82-002659] p0258 N82-20283

CARGO
Possibility for energy conservation in transporting freight by truck [DE81-030072] p0179 N82-18071

CARNOT CYCLE
Thermodynamic limits to photovoltaic solar energy conversion efficiency p0211 A82-24213

CARRIER INJECTION
The influence of surface conditions on the open circuit voltage of silicon solar cells p0207 A82-24169

CARRIER TRANSPORT (SOLID STATE)
Charge collection microscopy on p-WSe2 - Recombination sites and minority carrier diffusion length --- solar cell materials p0200 A82-23788

CASE HISTORIES
Energy and environmental quality: Case histories of impact management [DE81-028435] p0173 N82-16565

CASES (CONTAINERS)
Airtight collector casings --- and roof mounting frame for solar absorber panels [SHPT-PL-T-81-184] p0227 N82-18716

CASTING
Precision casting for gas turbine engines p0275 A82-28313

CATALOGS (PUBLICATIONS)
Passive solar products catalog, 1981 [DE82-000292] p0224 N82-16540

CATALYSIS
Catalytic coal conversion support: Use of laser flash-pyrolysis for structural analysis [DE82-004221] p0246 N82-16275
Concepts of fundamental processes related to gasification of coal [DE82-000763] p0246 N82-16282

Chemistry and catalysis of coal liquefaction: Catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels
[DE82-000762] p0249 N82-17315
Supported metal carbonyls: New catalysts for liquefaction of coal
[DE82-002659] p0258 N82-20283

CATALYSTS
The sulfur thermochemical cycle for hydrogen production
p0239 A82-19449
High temperature durable catalyst development
p0270 A82-20739
Hydrocracking of coal using molten salts as catalysts
p0243 A82-24969
Flash hydropyrolysis of Western Kentucky no. 9 bituminous coal with catalyst
[DE81-029631] p0244 N82-16210
Concepts of fundamental processes related to gasification of coal
[DE82-000763] p0246 N82-16282
Investigation of sulfur-tolerant catalysts for selective synthesis of hydrocarbon liquids from coal-derived gases
[DE82-000274] p0246 N82-16284
Exhaust emissions from high-mileage catalyst-equipped passenger cars
[PB82-103326] p0173 N82-16586
Coal-liquefaction catalyst development
[DE82-000137] p0249 N82-17314
Chemistry and catalysis of coal liquefaction: Catalytic and thermal upgrading of coal liquid and hydrogenation of CO to produce fuels
[DE82-000762] p0249 N82-17315
Supported metal carbonyls: New catalysts for liquefaction of coal
[DE82-002659] p0258 N82-20283
New catalysts for the indirect liquefaction of coal
[DE82-000892] p0261 N82-21281
Research on solvent-refined coal
[DE82-002530] p0263 N82-21437

CATALYTIC ACTIVITY
High temperature durable catalyst development
p0270 A82-20739
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[DE82-001127] p0251 N82-17401
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[DE81-030849] p0251 N82-17402
Exploratory study of coal-conversion chemistry
[DE82-001104] p0258 N82-20281

CAVITIES
Effects of gas-flow pattern on cavity shape
[DE82-000347] p0247 N82-16375
Effect of thermomechanical properties on initial cavity growth
[DE81-030839] p0249 N82-16918

CELL ANODES
Photoresponse of n-type semiconductor NiTiO3 --- as stable semiconducting anodes in photoelectrolysis of water
p0239 A82-20075
Thermodynamic studies of Li-Ge alloys - Application to negative electrodes for molten salt batteries
p0289 A82-23777
A review of recent developments in thermal batteries
p0289 A82-24242

CELLS (BIOLOGY)
Hydrogen production by immobilized cells. I - Light dependent dissimilation of organic substances by Rhodopseudomonas palustris
p0240 A82-25778

CEMENTS
Calcium silicate cements for desulfurization of combustion gases
[DE82-003245] p0260 N82-20696

CENTRIFUGES
Electrocyclone development program
[DE81-030004] p0264 N82-21780

CERAMIC COATINGS
Novel metal-ceramics-composite sealing coatings in aircraft engines
p0167 A82-24803

CERAMICS
Evaluation of silicon-on-ceramic material for low-cost solar cells
p0206 A82-24154
Ceramic technology for solar thermal receivers
[ASME PAPER 81-WA/SOL-24] p0216 A82-24622
Production technology of an oxygen ion conductive ceramic for high temperature fuel cells and high temperature water electrolysis
[BMFT-FB-T-81-180] p0282 N82-19691

CERMETS
Novel metal-ceramics-composite sealing coatings in aircraft engines
p0167 A82-24803

CHANNEL FLOW
Performance characteristics of open-cycle linearly-diverging diagonal type single- and multiple-load generators
p0269 A82-19297
Analysis of power takeoff in diagonal conducting wall channels
p0272 A82-24015
Heat transfer characteristics of a back-corrugated absorber surface for solar air collectors
[ASME PAPER 81-WA/SOL-5] p0214 A82-24607
